Rhaetic beds, typical of the Rhaetic Alps, mark the re into western Europe, by a wide-spread marine transgression the seas that characterized the subsequent Mesozoic era, and f a passage between Keuper and Lias (Infra-Lias of Fran although the molluscan fauna and the flora suggest a Tria age. In Germany the Rhaetic consists mainly of pale sandst and grey shales. The fauna—with *Avicula* (*Pteria*) *conto Protocardium rhaeticum,* and other forms—is not rich, highly important, because of its great extent. Remark features are the bone-beds, a few inches thick, which occu several horizons, crowded with teeth, bones, scales and copro of fishes and reptiles. Here are found *Ichthyosaurus Plesiosaurus,* anticipating their maximum development; w remains of *Belodon* and *Mystriosuchus* serve as a link Triassic Stegocephalian reptiles. Teeth of *Microlestes antiq* the oldest known mammal, occurred near Stuttgart.

Trias of German type, including Muschelkalk, extends at in vals beyond the Pyrenees to the south of Spain. Triassic r occur in Heligoland and there is an outlier of Upper Tria in the south of Sweden which includes coal-bearing Keuper marine Rhaetic. Trias with Muschelkalk extends from Si into Poland. In north-west Russia the beds belong chiefly to Tartaric stage—in part only Triassic.

BRITAIN AND IRELAND

As in Germany (excluding the Rhaetic) the Trias of G Britain is of continental facies. Its outcrop in England Wales is narrow in the south-west, but expands in the Midl and bifurcates at the southern end of the Pennines, one exten projecting into Durham, the other into Cumberland and W morland, whence it extends into parts of south Scotland. O occurrences are found in the Western Isles and on the opp shores of Moray firth. Denudation has removed the Trias f all but north-eastern Ireland.

No representative of the Muschelkalk has been found.

The deposits usually follow the Permian (where develop with conformity, although minor discordances occur here there. Tending to fill up the Permian basins, they spread many cases, further afield and rest upon still older rocks, t higher members often overlapping their lower divisions. typical sequence is as follows, and is compared with that oc ring west of the Pennines:

The relationship of Trias to Permian is difficult to determ As stated elsewhere (*see* PERMIAN) it has been claimed part, if not all, of the Bunter of Nottinghamshire is equiva to a great part of the Permian Zechstein of Durham. awaits more general acceptance or denial: what may be conc

hat probably the Lower Mottled Sandstone of South Notts represent some of the highest Permian strata occurring her north. The Lower Mottled Sandstone of Wirral (Cheshis possibly also of Permian age, whilst there are grounds the belief that the St. Bees Shales (correlated with the ham Permian Marls) are transition beds and may represent, art at least, Lower Mottled Sandstone of other areas.

he Mottled Sandstones consist typically of alternations of red and variegated sandstones, generally without pebbles. Nottinghamshire and south Yorkshire the Upper group is nt. The Pebble Beds are harder red and brown sandstones, , in places, strong false-bedding, aeolian sand grains, dreier, etc. In some localities they contain abundant quartzose bles, probably derived from local sources now concealed. In Midlands they form undulating country typically expressed Cannock Chase and Sherwood Forest and furnish a first-class r-bearing horizon. In Devon is the "Budleigh Salterton ble-bed," with pebbles derived both from Normandy and a northern local source. These Pebble beds were accumud chiefly in shallow water, but some of the coarser deposits represent dune sands. The absence of pebbles, and the finer e of material, makes it difficult to distinguish the Bunter of h Yorkshire and Durham from the Keuper. The St. Bees Kirklinton Sandstones also are almost devoid of pebbles. ccias (Brockrams) were formed continuously to the west of Cumberland hills both before and during the deposition of Zechstein, St. Bees Shales, and part of the St. Bees Sandstone mphasizing the intimacy of these deposits.

euper deposits extend into most of the above described ons, in places slightly unconformable to the Bunter, beyond limits of which they frequently extend, and may have local cias at the base. Of these the best known is the "Dolomitic glomerate" (Bristol district), a shore-line breccia of the inland per sea which gradually buried a well-dissected landscape of r rocks. It is largely composed of Carboniferous Limestone in a dolomitic matrix, but local patches contain Old Red lstone. It has yielded reptiles (*Thecodontosaurus, Palaeo-us*). The Keuper of Charnwood Forest, Leicestershire, con- s mountains of which the tops only are now visible.

ypical Keuper Marl consists of rhythmic alternations of olate red marls, red shales and pale dolomitic sandstones rries). In the Midlands is the Arden Sandstone with *Estheria, odus, Acrodus,* Labyrinthodonts and plants. The Waterstones variegated shales and marls with soft red sandstone; whilst Lower Keuper Sandstones are false-bedded freestones—not ys present. In Worcestershire the latter have yielded scor- s, and, near Birkenhead, Cheshire, footprints of reptiles.

t the top of the Keuper is a belt of "tea-green marls" which, he south-western counties, pass up into fossiliferous grey es (Sully Beds). These shales have been classed with the etic.

ypsum and alabaster appear at several horizons, the most ortant occurring in the Midlands at 60–70 and 160 ft. respecy below the Rhaetic. They are extensively mined (Newark, Chellaston, etc.). In Cheshire and Worcestershire great beds of salt set in at lower horizons, and this mineral appears also at Puriton in Somerset. The Stanwix Shales of the Carlisle district carry gypsum, whilst those of the Isle of Man, Walney Island and Preesall, Lancashire, have deposits of rock-salt.

In Britain the Rhaetic (or Penarth) Beds usually consist of White Lias (well developed in the south-west) on dark *Avicula* (*Pteria*) *contorta* Shales. Certain smooth-textured White Lias limestones yield a landscape marble (Cotham): at the top is the sun-bed or "jew-stone." At the base of the *Avicula* Shales is a bone-bed with fossils similar to those of Germany, including the mammal *Microlestes,* which is also found in the Sully Beds.

In South Scotland the Annan Sandstone is correlated with the St. Bees Sandstone, whilst in Arran the Bennan Shales and Auchenshaw Sandstones and Shales are considered to be Bunter, and the overlying marls and shales (Levencorroch and Torr nan Uain) Keuper. At the top are grey-green marls succeeded by Rhaetic Beds. Triassic rocks occur also in Skye, Raasay and Mull—breccias, conglomerates, marls and cornstones, with gypsum in the upper beds—and at Morven and Ardnamurchan (Argyllshire) and Gruinard bay (Ross-shire). There is a complete passage into the Lias here. The Trias of Elginshire south of Moray Firth contains sandstones with a reptilian fauna. That of the lower beds is allied to the Karroo forms, whilst the upper beds (Lossiemouth) contain *Hyperodapedon gordoni, Ornithosuchus woodwardi,* etc., which are undeniably Triassic.

In Ireland existing Triassic deposits have been largely protected by Tertiary basalts. Both Bunter and Keuper are represented (Lagan valley) very similar to that of the Cumberland coast: at Carrickfergus and Kilroot, near Belfast, rock salt is found in the Marls. Rhaetic beds with *Avicula contorta,* etc., link the Keuper with the Lias (Larne; Collenglen, near Belfast).

THE ALPS

The marine Trias is frequently referred to as "Alpine," "Mediterranean" or "Pelagic." In Europe and eastwards through Asia it forms part of the deposits of the great Mediterranean sea, or "Tethys," situated north of Gondwanaland. (*See* article PERMIAN.) The facies is distributed widely in southern Europe, particularly in the eastern Alps, Apennines, Sicily, Balearic Islands, Spain, Balkan Peninsula and part of the Carpathians.

In the Alps, where the rocks form a broad zone on both sides, sandy rocks are subordinate to limestones, dolomites and marls, whilst the fauna makes that of the German Muschelkalk appear poor by comparison. The following divisions are recognized, chiefly in the eastern Alps:—

Keuper	Rhaetic	Dachsteinkalk and Kössener beds	with *Megalodon triqueter* and *Avicula contorta.*
	Norian	Dachsteinkalk and Hauptdolomit (or)	„ *Megalodon triqueter, Worthenia solitaria,* etc.
		Hallstatterkalk	„ *Pinacoceras metternichi, Cladiscites, Halorites,* etc.
	Karnic	Raibl beds	„ *Tropites subbullatus* and *Trachyceras aonides.*
	Ladinic	St. Cassian beds	„ *Tracheyceras aon*
		Wengen beds	„ *Daonella lommeli*
		Buchenstein beds	„ *Protrachyceras reitzi, Ceratites, Arcestes,* etc.
Muschelkalk	Anisic	Alpine Muschelkalk (with Mendoladolomite, etc.)	„ *Ceratites trinodosus, Athyris trigonella, Spiriferina fragilis, Pinacoceras, Gervillia socialis,* etc.
Bunter	Scythic	Werfen beds	„ *Myophoria costata, Avicula clarai, Ceratites cassianus, Tirolites,* etc.

The Werfen beds (Salzburg) are conformable to the underlying Permian and consist of red sandy shales and beds of gypsum and rock-salt, with impure limestone in the upper part. The

Alpine Muschelkalk is highly fossiliferous and differs in many respects from that of Germany, being of truly marine character. Typically the Ladinic consists of limestones, dolomites, tuffs and lavas, though there is also a calcareous and a dolomitic facies. In the St. Cassian beds the fossils are dwarfed.

The Raibl beds indicate a regression of the sea, evidenced by plant-bearing sandstones (Lunz), and marls with gypsum. The Rhaetic consists generally of marly limestones forming a thin but continuous sheet.

The small masses of limestone of Bogdoberg (Kirghiz Steppes, south Russia) overlying red sandstones and marls are portions of Muschelkalk of Alpine type on the equivalents of the Bunter.

Marine Trias occurs also in Asia Minor, many parts of Asia as far east as China, the Indo-Pacific islands, Japan, Spitsbergen, New Zealand, New Guinea, Timor, Peru, Colombia, Mexico and western North America. With the exception of the last these areas lie north of or on the margins of Gondwanaland. Certain of these occurrences are dealt with below.

ASIA

In India the finest development of marine Trias occurs in the Himalayas. In Spiti (Lilang), Garhwal and Kumaon and on the north-west extension of the same geo-synclinal axis in Kashmir the rocks comprise three subdivisions corresponding to the Alpine Bunter, Muschelkalk and Keuper (with Rhaetic). The Bunter, which rests conformably on the Permian Productus Shales, consists of 50 ft. of shales and limestones with an ammonite fauna (*Otoceras, Ophiceras, Meekoceras*). The Muschelkalk is chiefly concretionary limestones, 400 ft. thick, with *Ceratites, Siberites,* etc., and, at the top a Daonella (lamellibranch) limestone. The Keuper comprises 2,000 ft. of shale and marl beneath thick limestones and dolomites with a cephalopodan fauna. The lower division corresponds to the Karnic and Noric stages, whilst the limestones probably represent the Rhaetic.

In the north-west Himalayas (Sirban Mountains, Hazara) Trias rests unconformably on Devonian shales and limestones (Infra-Trias). Felsitic lavas are succeeded by limestones from 500–1,200 ft. thick, with characteristic fossils.

Trias of reduced thickness and comprising only the Lower and part of the Middle division occurs in the western part of the Salt Range where it caps the Permian Productus Limestone. The Lower division consists of thin limestones with an extraordinary abundance of *Ceratites*. The Middle, or Muschelkalk, contains many cephalopods.

In north Baluchistan shales and slates with a few limestones represent the Rhaetic stage. It contains *Monotis* and cephalopods (*Didymites, Halosites*) and rests unconformably on Carboniferous Fusulina limestone. A similar development occurs in the Arakan Yoma of Burma whilst in the Northern Shan States the Noping beds, with *Avicula contorta,* suggest a Rhaetic age.

Peninsular India was at this time joined up to Australia and Antarctica, Madagascar, South Africa, and South America, and formed part of the continent named Gondwanaland. (*See* article PERMIAN.) The Trias is represented by the Middle Gondwana Series which is divided into three groups:—Panchet, Kamthi and Maleri (or Denwa) corresponding approximately to the divisions of the German Trias. In the type area (Satpura Range) the rocks consist of massive sandstones, conglomerates, grits and shales devoid of coal seams and are unconformable to the Permian Damuda Series. Vegetation, hitherto profuse, became scanty or failed.

The Panchet group (1,500 ft.) is of restricted development and is overlapped by the Kamthi division (3,000–8,000 ft.), whilst the Maleri is of variable thickness and occurs but locally. In the Panchet group vertebrate remains include fishes, Labyrinthodonts (*Stegocephala*), Amphibia (*Glyptognathus,* etc.) and reptiles (*Dicynodon,* etc.), whilst the Kamthi group contains similar forms as well as a flora with *Glossopteris, Gangamopteris, Phyllotheca,* etc. The clayey Maleri group has remains of fishes (*Ceratodus*), Labyrinthodonts (*Gondwanosaurus*) and reptiles (*Hyperodapedon,* etc.). Biologically the fauna agrees closely with the English Trias.

AFRICA

In South Africa the Triassic deposits are continental and for the greater part of the Karroo Beds covering much of what now the Union. They occur also in south-west Africa, alo the borders of the Kalahari, over parts of Rhodesia, Portugue Africa and regions farther north.

In the Cape Province, the Permian Ecca Beds are followed the Beaufort and Stormberg Series, the former divided into Low Middle and Upper Beds, the latter into Molteno Beds, R Beds, Cave Sandstone and Drakenberg Volcanics. In cent Transvaal the Beaufort Series is absent and the Stormberg Ser is represented by Bushveld Marls, Sandstone and Amygdaloi The Lower Beaufort Beds, with their reptilian remains (*Par saurus, Dicynodonts,* etc.), are consideerd by du Toit to Upper Permian and the Volcanics to cover the period fr Rhaetic to Lias; the Middle Beaufort are Lower Triassic and remainder (Upper Beaufort–Cave Sandstone) Upper Triassic.

The Beaufort beds of the Cape are divided by lithologi characters agreeing with fossil vertebrate zones. The Mid group consists of mudstones and sandstones, whilst the Up group has more of the bright coloured mudstones. They c tain reptiles (*Erythrosuchus, Cynognathus,* etc.) and Amphibi (*Trematosaurus,* etc.). Plants include *Schizoneura,* and, at top, *Thinnfeldia, Ginkgoites,* etc. Rhodesian representatives the Upper Wankie Sandstone (with fresh-water beds, *Glossopte* and reptiles) and the Madumabisa Shales.

The Stormberg Series occurs in Basutoland and neighbour parts of the Union. The Molteno Beds, which disappear nor wards, contain silicified trunks of Dadoxylon and plant rema (*Thinnfeldia, Ginkgoites, Schizoneura,* etc.). The Red Beds t northwards, becoming the Bushveld Marls, represented on R desia by Escarpment Grits. Next comes the massive Cave Sa stone, with false-bedding primarily of aeolian origin. Its coun parts are Bushveld Sandstone (Central Transvaal) and the For Sandstone (Rhodesia).

The Drakenberg Volcanics are basaltic lavas with, in pla agglomerates and ashes or beds of sandstone near the base. Mont-aux-Sources, Natal, they are 4,500 ft. thick. North Pretoria (Springbok Flats) they become amygdaloidal basa whilst in the Wankie-Zambezi area (Rhodesia) the Batoka Bas form the picturesque scenery about Victoria Falls. Intrusive the Karroo system is a phenomenal number of sills and dikes dolerite.

Beaufort beds have been detected on the west coast of Ma gascar overlying coal-bearing beds with *Glossopteris.*

AUSTRALIA

In New South Wales Triassic strata of the Sydney-Blue Mo tain area follow the Permian nearly conformably. The dist was above sea and extended farther east than at present, deposits being formed in shallow fresh water lakes. The Haw bury Series is divided into Narrabeen, Hawkesbury Sandstone Wianamatta Stages in upward sequence. The Narrowbeen thin westwards from the coast, becoming also coarser. *Esth coghlani* is common at one horizon; *Schizoneura* is abund *Glossopteris* is rare.

Hawkesbury Sandstones are strikingly represented near Jackson and in the canyons and ravines of the Blue Mounta They contain plants (*Thinnfeldia, Phyllotheca*), fish (*Cerat* and shark) and Labyrinthodonts (*Mastodonsaurus, Platyce* The Wianamatta beds are largely clay shales with ferns (*Th feldia, Alethopteris australis*), Ginkgoales, Cycadaceae, Equ taceae, fish (*Palaeoniscus,* etc.), a few molluscs and crustace

Of slightly later date (Trias-Jura) are the Clarence Serie New South Wales and the Artesian Series of the New Eng Tableland. They seem to be equivalent to the Ipswich and rum Beds of Queensland and the Gippsland and Otway Bed Victoria. In Tasmania the Knockfofty Series and the overl Ida Bay Series, near Hobart, possibly represent the Hawkes Series.

NEW ZEALAND

Trias forms the lower division of the Hokonui System in Zealand and consists of sandstones, shales and conglomerate

arine and fluviatile origin (with plant-remains from a conti-al region to the north-west in the present Tasman sea) inter-ted with marine beds containing characteristic species of the ne Trias of south Europe and India. The Noric, Karnic and of the Ladinic stages are represented.

AMERICA

n South America the sea lay westward of Gondwanaland, ne Trias occurring west of the Andes. In Uruguay, Paraguay south Brazil continental deposits are remarkably like those arts of South Africa. The Rio do Rasto Beds comprise varie-d mudstones and sandstones and pass up through aeolian lstones into the Botucatu Sandstone, which is covered by ltic lavas that occupy an enormous region in Paraná, Santa herina, Paraguay, etc. *Scaphonyx,* from the Rio do Rasto s is allied to *Erythrosuchus* of the Upper Beaufort Beds. The er groups resemble the Cave Sandstone and Drakenberg canics.

tillite in eastern Argentina passes up into unfossiliferous s rather like those of the Falklands, where the thick Lafonian rmo-Triassic) System covers over one half of the eastern nd. Towards the top the facies resembles that of the Beau-Beds.

he Appalachian revolution in North America resulted in the ft of the eastern and southern part of the continent with concurrent formation of continental deposits. Open sea lay he Pacific border and extended inland to the site of the Rocky untains, where the chief deposits were of fresh-water type.

n the Eastern States disconnected and faulted troughs filled nly with Middle and Upper Triassic deposits extend from va Scotia through Connecticut and New Jersey (Newark tem) to South Carolina. Deposits are usually red and every-re unconformable to underlying formations. With them are ociated sheets (*e.g.* "palisades" of the Hudson, New Jersey) dikes of diabase, and basaltic lavas. The Newark System, 000 ft. thick, is divided into the Stockton-Norriston, Locka-g and Brunswick Groups. The sediments and their scanty fos-(land-plants, fishes and tracks of reptiles) point to deposition er semi-arid conditions.

he finest development of marine Trias is in the Sierras, Cali-nia, Nevada, Idaho and Oregon, where the deposits are usually areous and about 4,000 ft. thick. From Vancouver to Queen rlotte Islands they increase to 13,000 ft., more than nine-ths being volcanic.

he early Triassic sea stretched eastwards possibly to central oming. In middle times it withdrew westward, whilst later pread from Alaska to northern Mexico. This sea had connec-with Asia by the northern Pacific, and with "Tethys" by of the northern shores of Gondwanaland. The deposits can divided in harmony with the Alpine Trias, California posses-the best known development of the Upper Trias. The Noric epresented by two zones, in the lower of which coral reefs *traeidae*) extend from California into Alaska. Almost 25% he fauna is identical with that of the Mediterranean area.

hroughout the Rocky Mountain region between Canada and tern Texas, and in northern New Mexico and Arizona, conti-tal Upper Triassic gypsiferous shales and sandstones overlie er eroded formations often of a similar character. They con-bone conglomerates with amphibia (*Stegocephalia*), croco-an types (*Mystriosuchus*) and dinosaurs. Silicified wood, as he petrified forest of Arizona (Flagstaff), is common. Plants ude cycads, ferns and conifers. Gingkos were represented *Baiera* (also in Upper Karroo). The *Glossopteris* flora, so racteristic of Gondwanaland, is absent. (B. Sm.)

TRIBALLI, in ancient geography, a Thracian people whose liest home was near the junction of the Angrus and Brongus e east and west Morava), and included towards the south "the ballian plain" (Herodotus iv. 49), which corresponds to the n of Kossovo in Turkey. In 424 B.C. they were attacked by lces, king of the Odrysae, who was defeated and lost his life the engagement. On the other hand they were overcome by Autariatae, an Illyrian tribe; the date of this event is uncer-tain (Strabo vii. 317). In 376 B.C. a large band of Triballi crossed Mt. Haemus, and were preparing to besiege Abdera when Chabrias appeared off the coast with the Athenian fleet and compelled them to retire. In 339 B.C. when Philip II. of Macedon was returning from his expedition against the Scythians, the Triballi refused to allow him to pass the Haemus unless they received a share of the booty. Hostilities took place, in which Philip was defeated (Justin ix. 3), but the Triballi appear to have been subsequently subdued by him. After the death of Philip, Alexander the Great in 334 crossed the Haemus and drove the Triballi to the junction of the Lyginus with the Danube. Their king Syrmus took refuge in Peuce, an island in the Danube, whither Alexander was unable to follow him. The punishment, however, inflicted by him upon the Getae (*q.v.*) induced the Triballi to sue for peace. In spite, however, of misfortunes at the hands of the Gauls, they continued (135–84 B.C.) to cause trouble to the Roman governors of Macedonia. Under Tiberius mention is made of Triballia in Moesia, and the Emperor Maximin (A.D. 235–237) had been commander of a squadron of Triballi.

TRIBE. A tribe is defined by Dr. Rivers as "a social group of a simple kind, the members of which speak a common dialect, have a single government, and act together for such common purposes as warfare." In this definition it is necessary to understand by single government a political unity of a very simple kind, which may not imply the existence of any obvious mechanism of government, such as an hereditary monarchy or an elected council, with which we are familiar amongst civilized peoples.

Although it is usual to regard primitive peoples as always organized in definite tribes (Carveth Read, *The Origin of Man and his Superstitions,* 1925), the tribe as a definite group is often entirely lacking. In the case of pastoral peoples, definite groups with a political function, transcending families and clans, are likely to occur, but a settled population needs no such unification, unless the special demands of industry or the need for united action in warfare necessitate central control or the delimitation of groups. Thus it is often difficult in Melanesia to find any division of the people into distinct political units. One district usually shades into another politically, unless there is established enmity between the groups; and the names of groups, which might be thought to be tribal names, are found to be of indefinite extension. In these cases the social and political organization is comprised in the family, clan and local relations; the political solidarity of any given district depends on the sum-total of family, clan, local and personal relationships in that district (W. E. Armstrong, *Rossel Island,* 1928). There is tribal organization but there are no distinct tribes. In other places, however, in which social organization is of the same general kind, but in which conditions, such as isolation on a small island, or historical circumstances, have unified a district, on account of economic or other conditions, we can speak of definite tribes. In so far as the political unity of such a district becomes dependent on locality, rather than on kinship and other relationships between the members of the district, the tribe passes into a simple form of state.

Bibliography.—The tribe is discussed in most general works on Sociology; for example, in Giddings, *Principles of Sociology* (New York, 1896); in R. H. Lowie, *Primitive Society* (1921) under the heading "Government," and in W. H. R. Rivers, *Social Organization* (1924).

TRIBONIAN, the famous jurist and minister of Justinian, was born in Pamphylia in the latter part of the 5th century. Adopting the profession of an advocate, he came to Constantinople and practised in the prefectural courts there, reaching such eminence as to attract the notice of the emperor Justinian, who appointed him in 528 one of the ten commissioners directed to prepare the first *Codex* of imperial constitutions. When the commission of sixteen eminent lawyers was created in 530 to compile a collection of extracts from the writings of the great jurists of the earlier empire, Tribonian was made president. He had already been raised to the office of quaestor, which at that time was a sort of ministry of law and justice, something like that of the English lord chancellor of the later middle ages. During the progress of the work of the commission there broke out in Constantinople (532) the Nika insurrection. Tribonian

was accused of having prostituted his office for the purposes of gain, and the mob searched for him to put him to death (Procop. *Pers.* i. 24–26). Justinian, yielding for the moment, removed him from office, and appointed a certain Basilides in his place. After the suppression of the insurrection the work of codification was resumed. A little earlier than the publication of the *Digest*, or *Pandects*, there had been published another but much smaller law-book, the *Institutes*, prepared under Justinian's orders by Tribonian, with Theophilus and Dorotheus, professors of law (see Preface to *Institutes*). About the same time the emperor placed Tribonian at the head of a fourth commission, consisting of himself as chief and four others—Dorotheus, professor at Beyrut, and three practising advocates, who were directed to revise and re-edit the first *Codex* of imperial constitutions. The new *Codex* was published in November 534. With it Tribonian's work of codification was completed. But he remained Justinian's chief legal minister. He was reinstated as quaestor some time after 534 (Procop. *Pers.* i. 25; *Anecd.* 20) and seems to have held the office as long as he lived. He was evidently the prime mover in the various changes effected in the law by the novels of Justinian (*Novellae constitutiones*). The date of his death has been variously assigned to 545, 546 and 547. *See* JUSTINIAN.

The usual criticisms on Tribonian may be found in the *Anti-Tribonianus* (1567) of Francis Hotman, and an answer to them in J. P. von Ludewig, *Vita Justiniani M. atque Theodorae Augustorum, nec non Triboniani* (1731).

TRIBUNE [Lat. *tribunus*, connected with *tribus*, tribe], a name assigned to officers of different descriptions in ancient Rome.

Military Tribunes.—The original tribunes were the commanders of the contingents of cavalry and infantry supplied to the Roman army by the early tribes: the Tities, the Ramnes, and the Luceres. In the historical period, the infantry in each legion was commanded by six tribunes, and the number six is to be traced to the doubling of the three tribes by the incorporation of the new elements which received the names of *Tities secundi, Ramnes secundi, Luceres secundi.* The *tribuni celerum*, or commanders of the horsemen, no longer existed in the later times of the republic, having died out with the decay of the genuine Roman cavalry. So long as the monarchy lasted these tribunes were nominated by the king as commander-in-chief; and the nomination passed over to his successors, the consuls. From 362 B.C. six tribunes were annually nominated by popular vote, in 311 B.C. the number was raised to 16, and in 207 B.C. to 24, at which figure it remained. The tribunes thus elected sufficed for four legions and ranked as magistrates of the Roman people, designated *tribuni militum a populo*, while those who owed their office to the consuls bore the title of *tribuni rufuli.* The rights of the assembly passed to the emperors, and "the military tribunes of Augustus" were still contrasted with those nominated in the camp by the actual commanders. (For *Tribuni aerarii, see* AERARII.) There was another important class of tribunes that owed its existence to the army. In the long struggle between the patrician and plebeian sections of the population, the first distinctions to which the plebeians forced their way were military, and the contest for admission to the consulate was, in part, a contest for admission to the supreme command of the national forces. In 445 B.C., power was given to the senate of determining from year to year whether consuls or military tribunes with consular authority (*tribuni militares consulari potestate*) should be appointed. But no election was valid without the express sanction of the senate.

Tribunes of the Plebs.—The most important tribunes were the tribunes of the *plebs* (*tribuni plebis*). These were the outcome of the struggle between the patrician and the plebeian orders. When in 494 B.C. the plebeian legionaries met on the Sacred Mount, it was determined that the plebeians should by themselves annually appoint executive officers, two tribunes (the very name commemorated the military nature of the revolt) to confront the two consuls, and two helpers, called *aediles*, to balance the *quaestors*, and that the persons of the tribunes and aediles should be regarded as inviolable. The ancient traditions concerning the revolution are extremely confused and contradictory. It must have ended in something which was deemed by both the contending bodies to be a binding compact, although t lapse of time has blotted out its terms. This is necessary explain the "sacrosanct" character always attached to the tribu ate. There must have been a formal acceptance by the patricia of the plebeian conditions; probably the oath which was fi sworn by the insurgents was afterwards taken by the whole co munity, and the "sacrosanctity" of the plebeian officials becar a part of the constitution. There must also have been some co stitutional definition of the powers of the tribunes. These rest at first on an extension of the power of veto which the repub had introduced. Just as one consul could invalidate an order his colleague, so a tribune could invalidate an order of a cons or of any officer inferior to him. There was, no doubt, a vag understanding that only orders which sinned against the just a established practice of the constitution should be annulled, a then only in cases affecting definite individuals. This was tec nically called *auxilium.* The cases which arose most commor concerned the administration of justice and the levying of troo

Development of the Tribunate.—Although the revoluti of 494 B.C. gave the tribunes a foothold in the constitution, it l them with no very definite resources against breaches of compa by the patricians. The traditional history of the tribunate fr 494 to 451 B.C. is obscure; but there is a thread running throu it which may well be truth. We hear of attacks by patricians the newly won privileges, even of the assassination of a tribu and of attempts on the part of the plebeians to bring patrici offenders to justice. The plebeians attempted to set up a crimi jurisdiction for their own assembly parallel to that practised the older centuriate assembly. Furthermore, the *plebs* attempt something like legislation; it passed resolutions which it hoped force the patrician body to accept as valid. As to details, onl few are worth notice. In the first place, the number of tribu was raised to ten; how we do not know, but apparently some c stitutional recognition of the increase was obtained. Then alteration is made in the mode of election. As to the origi mode, the authorities are hopelessly at variance. It was in acc ance with the Roman spirit of order that the tribunes, in summ ing their assemblies, should ask the plebeians to organize th supporters in bands. The *curia* was certainly a territorial distr and the tribunes may have originally used it as the basis of th organization. If tribunes were elected by plebeians massed *c atim*, such a meeting would easily be mistaken in later times the *comitia curiata.* A change was introduced in 471 B.C. by Publilian Law of Volero, which directed that the tribunes sho be chosen in an assembly organized on the basis of the Serv tribe, instead of the *curia.* This assembly was the germ of *comitia tributa.* The question by what authority the Law of V ero was sanctioned is difficult to answer. Possibly the law wa mere resolution of the plebeians with which the patricians did interfere, because they did not consider that the mode of elect was any concern of theirs. Whatever view may be taken of movement which led to the decemvirate, an important elemen it was the agitation carried on by the tribunes for the reduct of the law of Rome to a written code. Until they obtained t it was impossible for them to protect those who appealed aga harsh treatment by the consuls in their capacity of judges.

During the decemvirate the tribunate was in abeyance. It called into life again by the revolution of 449 B.C., which gave tribunes a considerably stronger position. Their personal pr leges and those of the aediles were renewed. The road was ope up to legislation by the tribunes through an assembly summo by them on the tribe-basis (*concilium plebis*), but subject to control of the senate. The growth of the influence of this assen over legislation belongs rather to the history of the *comitia* (q than to that of the tribunate. After the Hortensian Law of B.C., down to the end of the republic, the legislation of Rome mainly in the hands of the tribunes. The details of the histor the tribunate in its second period, from 449 to 367 B.C., are ha less obscure than those which belong to the earlier time. Th was, however, on the whole, undoubtedly an advance in dig and importance. Gradually a right was acquired of watching

fering with the proceedings of the senate, and even with legisn. Whether the absolute right of veto had been achieved be- 367 B.C. may well be doubted. But the original *auxilium,* or of protecting individuals, was, during this period, undergoing ry remarkable expansion. From forbidding a single act of a istrate in relation to a single person, the tribunes advanced to idding by anticipation all acts of a certain class, whoever the ons affected by these restrictions might prove to be. It efore became useless for the senate or the *comitia* to pass nances if a tribune was ready to forbid the magistrates to y them out. Ultimately, the mere announcement of such ntion by a tribune was sufficient to cause the obnoxious proj- to drop; that is, the tribunes acquired a right to stop all busi- alike in the deliberative assembly, the senate, and in the slative assemblies, or *comitia.* The technical name for this t of veto is *intercessio.* The two main objects of the tribunes e the opening of the consulate to plebeians, and the regulation ne state domain in the interests of the whole community. Both e attained by the Licinio-Sextian laws of 367 B.C.

hen a considerable change came over the tribunate. From g an opposition weapon it became an important wheel in the lar machine of state. As the senate became more and more eian, the old friction between senate and tribunes disappeared. vas found that the tribunate served to fill some gaps in the stitution, and its power was placed by common consent on a l constitutional basis. From 367 to 134 B.C. (when Tiberius cchus became tribune) the tribunate was for the most part a e organ of senatorial government.

ualifications and Powers.—Even after the difference be- en patrician and plebeian birth had ceased to be of much sequence, the plebeian character was a necessity for the trib- When the patricians P. Sulpicius Rufus and, later, P. Clo- (the antagonist of Cicero) desired to enter on a dema- c course, they were compelled to divest themselves of their ician quality by a peculiar legal process. The other necessary lifications were such as attached to the other Roman magis- ies: complete citizenship, absence of certain conditions re- led as disgraceful, and fulfilment of military duties. The elec- took place in a purely plebeian assembly, ranged by tribes, er the presidency of a tribune selected by lot. The tribune bound by law to see a complete set of ten tribunes appointed. hnically, the tribunes were reckoned, not as magistrates of Roman people, but as magistrates of the Roman *plebs;* they efore had no special robe of office, no lictors, but only mes- gers (*viatores*), no official chair, like the curule seat, but only ches (*subsellia*). Their right to summon the *plebs* together, ther for the purpose of listening to a speech or for passing nances, was rendered absolute by the "laws under sacred ction" (*leges sacratae*), which had been incorporated with the stitution on the abolition of the decemvirate. The right to mon the senate and to lay business before it was acquired after 367 B.C., but was seldom exercised, as the tribunes had ndant means of securing what they wanted by pressure applied he ordinary presidents, the consuls or the praetor. When *nterregnum* came about and there were no "magistrates of Roman people," the plebeian tribunes became the presidents he senate and conductors of state business. At the end of the ublic there were *interregna* of several months' duration, when tribunes held a position of more than usual importance.

he Right of Veto.—The real kernel of the tribune's power sisted in his *intercessio,* or right of invalidating ordinances, ther framed by the senate or proposed by a magistrate to the *itia,* or issued by a magistrate in pursuance of his office. From B.C. down to the time of the Gracchi the power of veto in lic matters was, on the whole, used in the interests of the gov- ng families to check opposition arising in their own ranks. A lcitrant consul was most readily brought to obedience by an cise of tribunician power. The tribunes found a field for con- t activity in watching the administration of justice, and in lering assistance to those who had received harsh treatment n the magistrates. The tribunes were, in fact, primarily legal ctionaries, and constituted in a way a court of appeal. It was to this end that they were forbidden to pass a whole night away from the city, except during the Latin festival on the Alban Mount, and that they were expected to keep their doors open to suppliants by night as well as by day. They held court by day in the Forum and frequently made elaborate legal inquiries into cases where their help was sought. We hear of this not infrequently in Cicero's speeches, and in other writings which deal with legal matters. According to the general principle of the constitution, magistrates could forbid the acts of magistrates equal to or inferior to themselves. For this purpose, the tribunes were deemed superior to all other officers. If a tribune exercised his veto no other tribune could annul it, for the veto could not be itself vetoed, but it was possible for another tribune to protect a definite individual from the consequences of disobedience. The number of the tribunes made it always possible that one might baulk the action of another, except at times when popular feeling was strongly roused. The veto was not, however, absolute in all directions. In some it was limited by statute; thus, the law passed by Gaius Gracchus about the consular provinces did not permit a tribune to veto the annual decree of the senate concerning them. When there was a dictator at the head of the state, the veto was of no avail against him. One of the important political functions of the tribunes was to conduct prosecutions of state offenders, particularly ex-magistrates. These prosecutions began with a sentence pronounced by the tribune upon the culprit; whereupon, exercising the right given him by the XII. Tables, the culprit appealed. If the tribune sought to inflict punishment on the culprit's person, the appeal was to the assembly of the centuries; if he wished for a fine, the appeal was to the assembly of the tribes.

The Late Republic and Empire.—It is commonly stated that a great change passed over the tribunate at the time of the Gracchi, and that from their day to the end of the republic it was used as an instrument for setting on foot political agitation and for inducing revolutionary changes. This view is an inversion of the facts. The tribunate did not create the agitation and the revolutions, but these found vent through the tribunate, which gave to the democratic leaders the hope that acknowledged evils might be cured by constitutional means, and in the desperate struggle to realize it the best democratic tribunes strained the powers of their office to their ruin. For the bad tribunes did not hesitate to use for bad ends the powers which had been strained in the attempt to secure what was good. But the tribunate only fared like all other parts of the republican constitution in its last period. The consuls and the senate were at least as guilty as the tribunes. After a severe restriction of its powers by Sulla and a restoration by Pompeius, which gave a twenty years' respite, the essential force of the tribunate was merged in the imperial constitution, of which indeed it became the principal constituent on the civil side. The ten tribunes remained, with very restricted functions. The emperors did not become tribunes, but took up into their privileges the essence of the office, the "tribunician authority" (*tribunicia potestas*). This distinction between the principle of the office and the actual tenure of the office was a creation of the late republic. Pompeius, for example, when he went to the east, was not made proconsul of all the eastern provinces, but he exercised in them a "proconsular authority," which was the germ of the imperial authority on its military side. Similarly the emperor, as civil governor, without being tribune, exercised powers of like quality with the powers of the tribune, though of superior force. By virtue of his tribunitian authority he acquired a veto on legislation, became the supreme court of appeal for the empire, and to his person was attached the ancient sacrosanctity. Augustus showed the highest statesmanship in founding his power upon a metamorphosed tribunate rather than upon a metamorphosed dictatorship, upon democratic rather than aristocratic traditions.

Rienzi.—The name "tribune" was once again illuminated by a passing glory when assumed by Cola di Rienzi (q.v.). The movement which he headed was in many respects extremely like the early movements of the plebeians against the patricians, and his scheme for uniting Italy in one free republic was strangely parallel with the greatest dream of the Gracchi.

TRICAMERON, BATTLE OF (A.D. 535). This battle is one of the landmarks in the Emperor Justinian's (*q.v.*) series of campaigns by which Italy, Africa and Southern Spain were temporarily recovered. In itself it was the decisive victory by which the army of the Eastern Roman empire overthrew the Vandal power in Africa, and in military history it has special significance as an outstanding illustration of the predominant power of cavalry during the 1,000 years which succeeded the overthrow of the Roman (infantry) legions at Adrianople (*q.v.*). Belisarius's infantry was a day's march in rear of his cavalry when he encountered the Vandal army, under King Gelimer, assembled in order of battle. So great was Belisarius's faith in the combined firepower and mobility of his horse-archers that he accepted the risk of battle without waiting for his infantry. He took up a position behind a small stream, hoping that he might have the opportunity to launch his own stroke while the Vandals were entangled in the crossing, and to this end sent out small detachments to tease them into an advance. Finding that the enemy were too wary, or too doubtful of success, to be drawn across the river, Belisarius took a more audacious risk—advancing his own centre through the stream as a bait. Thereupon the Vandals, still holding their centre back, moved their wings forward to envelop and assail the Roman centre during the passage. While the leading lines were locked in this close-quarter struggle, and the rear lines waiting to engage, Belisarius launched his own wings at them. The charge, having the advantage of impetus, shattered the Vandal wings. The Roman centre, if hard pressed for a brief time, had admirably fulfilled its rôle of fixing the enemy. The rout of the Vandal wings uncovered their centre, which was then surrounded and almost annihilated by the Romans.

TRICERATOPS, an extinct quadripedal herbivorous reptile about 12ft. long, with an immense head bearing three horns and a frill over the neck. Its remains are found in the upper Cretaceous rocks of Wyoming. It is a member of the Ornithopodous group of Dinosaurs (*q.v.*).

TRICHINOPOLY, a city and district of British India, in the Madras presidency. The city is on the right bank of the river Cauvery, 250 m. by rail S.W. from Madras. Pop. (1921), 120,422. The fort which forms the nucleus of the city measures about 1 m. by ½ m.; its defences have been removed. Within it rises the isolated Rock of Trichinopoly, 273 ft. above the city, which is ascended by a covered stone staircase, entered by a carved gateway, and profusely ornamented. Trichinopoly is an important trading centre and railway junction. Its industries are goldsmiths' work and modelling in pith; silk-weaving, cigar and soap-making. Trichinopoly and its neighbourhood were the scene of much hard fighting between the English and the French during the Carnatic wars between 1749 and 1761.

The DISTRICT OF TRICHINOPOLY has an area of 4,319 sq.m. The surface is generally flat, though broken by masses of crystalline rock, of which the Trichinopoly Rock in the fort is a well-known example. The only mountains are the Pachamalais, which rise to 2,500 ft. and extend into Salem district. The Cauvery and its branch, the Coleroon, are the only rivers of any importance. The climate is very hot and not liable to great variations; the annual average rainfall is about 34 in. The principal crops are rice, millets, other food-grains and oil-seeds. The main line of the South Indian railway traverses the district, with a branch to Erode. In 1921 the population was 1,902,838. The district came into British hands along with the rest of the Carnatic in 1801.

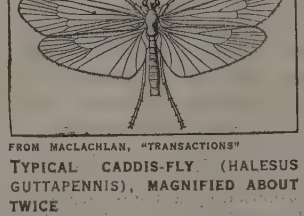
TRICHINOSIS or **TRICHINIASIS,** a disease, in man and other animals, caused by infection by the parasite *Trichina* or *Trichinella spiralis*. The presence of encysted trichinae in the muscles was discovered by Sir James Paget (*q.v.*) in 1835, and they were named by Sir R. Owen; but it was not until 1860 that the clinical characters of the acute disease caused by the invasion of the parasite were discovered by Friedrich von Zenker (1825–1898). Epidemics of this disease have occurred from time to time, especially in north Germany, from the eating of uncooked swine's flesh, in which trichinae are not uncommon.

The symptoms in man are occasioned by the presence of free parasites in the intestine, by the development of yo trichinae from the eggs, and most of all by the migration of parasites from the intestinal canal to the muscles, where t become quiescent. This cycle occupies from four to six we Lime-salts become deposited in the capsule, the calcificat rendering the cyst visible, and this change usually takes five six months. When consumed in small quantity, the parasites m give rise to no symptoms. In more serious cases, sometimes e ing fatally, the early symptoms are nausea, failure of appet diarrhoea and fever; later, when the migration to the mus begins, there is more fever, stiffness, pain and swelling in limbs, swelling of the eyelids, continued exhausting diarrh perspiration and sometimes delirium. The existence of a mar leucocytosis with an extraordinary increase of eosinophiles he diagnosis in cases where the symptoms are obscure. If the di nosis be made early in the case, brisk purgatives, particula calomel, are the best treatment; if the parasites are already their way to the muscles, the only thing left to do is to support patient's strength.

TRICHOPTERA, the term used in zoological classificat for that order of insects whose members are commonly known caddis-flies. They are sombrely coloured insects, being gener some shade of brown often with darker markings, and are of sm or moderate size. Caddis-flies are weakly flying insects of mo like appearance and are closely related to Lepidoptera: they not often seen on the wing unless disturbed, while many are n turnal and are attracted to a light. They are found in the vici of ponds and streams in which the early stages are passed.

Caddis-flies have four membranous hair-covered wings v a predominantly longitudinal venation: the hind wings are u ally the broader and have a plicated posterior lobe. The mou parts are of the biting type but are weakly formed and m dibles are either wanting or reduced to vestiges. Metam phosis is complete, the larvae being more or less eruciform campodeiform and mostly live in cases formed of various fore materials: the pupae have the appendages free and strong ma bles are present. More than 1,000 species are known and t are classified into thirteen families: about 400 species inh North America and over 170 are found in the British Isles.

The eggs are laid in masses covered with a mucilage and t are deposited in or near water. The larvae are aquatic and the familiar objects known as caddis worms. They have a w developed head, biting mouth-parts and rather long legs: resp tion takes place either by means of lateral filamentous trac gills or through the skin only. The last segment of the body ries a pair of appendages terminated by strong hooks. Most of larvae construct cases or shelters in which they live: these st tures are commonly tubular, and are formed of a warp of binding together fragments leaves, straw, sticks, gra sand or even of the shells small molluscs—the mate utilized often being constant particular species or gen Since these cases are open either end a current of water duced by the undulatory mo ments of the larva, flows thro the case and out at the hind tremity. Some larvae (*Hy psyche, Philopotamus,* etc.) struct silken snares, instead of cases, which serve to collect f particles wafted through them by the water. Pupation takes p either in the larval case or, in species without the latter, in speci constructed shelters of minute stones, sand, etc. The pupa bite way out by means of its jaws and either swims or wriggles to surface of the water to allow of the emergence of the perfect ins



FROM MACLACHLAN, "TRANSACTIONS"

TYPICAL CADDIS-FLY (HALESUS GUTTAPENNIS), MAGNIFIED ABOUT TWICE

Caddis-flies are found on all continents but relatively litt known concerning the tropical species. They are to be rega as beneficial insects, since their larvae are eagerly devoured

it and other fishes. In the fossil state they first appear in the of Europe and later in Oligocene Baltic amber.

BIBLIOGRAPHY.—Further information on caddis-flies will be found works on aquatic insects (*see* INSECTS): *see* also R. MacLachlan, *Phoptera of the European Fauna* (1874–80), and for the British lies *see* the same author in *Trans. Entomological Soc. London* 5, 1882). Life-histories of North American species are given in . Lloyd, *Bull. 21 Lloyd Library* (Cincinnati, 1921). (A. D. I.)

TRICONODONTA, a group of small, extinct, carnivorous nmals of the Jurassic age, characterized by the condition of molar teeth, which typically bore three cusps arranged in a the long axis fore-and-aft. They left no descendants. *See* MMALIA, PALAEONTOLOGY.

TRICOUPIS (or TRICOUPI), **CHARILAOS** (1832–1896), ek statesman, born at Nauplia, was sent to London in 1852 n attaché of the Greek legation. In 1865, after he had con- led the negotiations for the cession by Great Britain to Greece he Ionian Islands, he entered the Greek chamber of deputies, in 1866 became foreign minister, at the early age of thirty- r. He was prime minister for a few months in 1875 and again 880, 1882, and in 1885. In his fourth premiership he took seri- y in hand a financial reconstruction. But, in spite of all his rts, Greece could not meet her obligations. Tricoupis tried to e terms with the creditors of his nation, but he failed in this . The first taxation which he proposed aroused great hostility, in January 1895 he resigned. At the general election, four nths later, he and his party were defeated. He retired from lic life and died at Cannes on April 11, 1896.

TRICYCLE. A light road vehicle similar to a bicycle (*q.v.*) designed with three road wheels instead of two. In use it efore differs from a bicycle in that it is inherently stable and uires no "balancing," and so is specially suitable for elderly nervous persons desiring to cycle for health or pleasure.

Tricycles for tradesmen's carriers have two wheels side by side he front, and a single wheel behind. The box intended for ds is usually built between the two front wheels, while the r sits on a saddle mounted on a frame extending from the of the front wheels to the rear wheel, and steers the two els with box by a bar fastened to the box. He drives the lat- wheel by a similar arrangement of cranks, chain and sprocket hat on a bicycle.

For pleasure purposes the tricycle has the single or steering el at the front, and the two driving wheels behind. From the t of the wheel to the rider's saddle, and down to the bracket ding the cranks and pedals, etc. the construction is identical h that of a bicycle, but rearward there are bracing tubes con- ting the seat lug (*see* BICYCLE) to each end of the axle on ch the rear wheels are mounted, while two or more strong es are taken from the bracket to the centre of the axle to hstand the driving thrust. The driving chain runs over a small ocket wheel mounted at or about the centre of the axle, but to mit one wheel to over-run the other, as in rounding corners, the axle is in two halves connected by a differential (*see* TOR-CAR) on which the driven sprocket is mounted.

TRIDYMITE, a rare mineral consisting of silicon oxide or a, SiO_2, but differing from quartz in crystalline form. The stals are small, thin hexagonal plates or scales, which are usu- twinned together in groups of three; hence the name, from ek, *τρίδυμος*, triplet. The apparent hexagonal plates are mselves pseudo-symmetric twins of optically biaxial material, at a temperature of 117° C these optical anomalies disappear the plates are then truly hexagonal (β-tridymite). The spe- c gravity is 2·28 (that of quartz being 2·65). Unlike quartz, ymite is soluble in a boiling solution of sodium carbonate; it urs in the cavities of acid volcanic rocks (rhyolite, trachyte and lesite), but in most instances the crystals are replaced by a granular aggregate of quartz. At a temperature of 870° rtz passes over into β-tridymite with a considerable increase olume; and this change has an important bearing on siliceous ractory materials used for furnace linings and silica-bricks. a still higher temperature (1,470°) tridymite itself passes over another modification of silica known as cristobalite.

TRIER (French *Trèves*), an ancient city of Germany, formerly capital of an archbishopric and electorate of the empire, and now seat of a Roman Catholic bishop and chief town of a governmental department in the Prussian province of the Rhine. Pop. (1925) 57,344. It stands on the Moselle, about 6 m. from the Luxembourg frontier and 69 m. S.W. of Coblenz by rail on the Coblenz-Metz and Cologne-Saarbrücken lines.

Some of the piers and buttresses of the bridge over the Moselle may date from about 28 B.C. The well-preserved amphitheatre just outside the modern town to the south-east was probably built in the reign of Trajan or Hadrian. It accommodated about 8,000 spectators. The most remarkable Roman building is the *Porta Nigra*, the fortified north gate of the city, 115 ft. long, 75 to 93 ft. high and 29 ft. deep, built of sandstone blocks and held together with iron clamps. This building may date from the 1st to the 4th century A.D. It is also called the *Simeonstor*, after a Greek hermit who inhabited it. In 1035 Archbishop Poppo converted the gate into two churches, one above the other, but all the additions except the apse have now been removed. In the south-east of the city are ruins of the Roman imperial palace, and near the bridge substructures of the 4th-century Roman baths, 660 ft. long. On the Constantinsplatz stands the brick basilica, probably of the age of Constantine. Converted into a palace for the Frankish kings and their deputies, it passed in 1197 to the archbishops, and was restored (1846–56) and turned into a Protestant church.

Another Roman basilica forms the nucleus of the cathedral. Built under the emperors Valentinian I. and Gratian as a quadrilateral hall, it was converted into a church about the close of the 4th century, and restored by Bishop Nicetius about 550. It is the most important pre-Carolingian church in Germany. Archbishop Poppo and his successors in the 11th and 12th centuries extended the cathedral and added an apse at each end. The vaulting of the nave and aisles and the cloisters were added in the 13th century. In the vaults are buried 26 archbishops and electors. The most famous relic preserved is the "Holy Coat of Trier," believed by the devout to be the seamless robe of the Saviour, and said to have been discovered and presented to the city by the empress Helena. The cloisters connect the cathedral with the church of Our Lady, a building in the form of a circle intersected by a cross, with a vault, built 1127–1143, and said to be the oldest Gothic church in Germany. St. Matthias in the south, now represented by a 12th-century building, has a Christian cemetery of the Roman age. A market cross dates from 958, and a beautiful Renaissance fountain, the *Petersbrunnen* was erected in 1595. Close by are the *Steipe* or *Rotes Haus*, formerly the town hall, of the 15th century, and the *Frankenturm* or *propugnaculum*, of the 10th century.

The Provincial Museum (1885–89) contains many Roman and mediaeval antiquities, and the town library has valuable examples of early printing. Among its most treasured mss. are the *codex aureus*, a copy of the gospels presented to the abbey of St. Maximin by Ada, a reputed sister of Charlemagne, and the *codex Egberti* of the 10th century. At Igel is a remarkable Roman column, 83 ft. high. It dates from the 2nd century, and was the family monument of the Secundini. At Nennig is a fine Roman mosaic pavement.

HISTORY

The Treveri or Treviri, from whom the city derived its name, were one of the most powerful tribes among the Belgae, and according to Julius Caesar, who conquered them in 56 B.C., possessed the best cavalry in Gaul. Attempts have been made to show that they were of German origin (*see* BELGAE), but although they were doubtless subject to Germanic influences they spoke a Celtic language. The Roman city, Augusta Treverorum, was probably fortified by Augustus about 14 B.C., and organized as a colony about A.D. 50, in the reign of Claudius, but is not mentioned before the war of Civilis in 69 (Tacitus, *Hist.* iv.). At first the Treveri resisted the appeal of Civilis and his Batavi to join the revolt, and built a defensive wall from Trier to Andernach, but soon after the two Treverans, Tutor and Classicus, led their fellow tribesmen, aided by the Lingones (Langres), in the attempt to set up a "Gallic empire." After a brief struggle the

rebels were overthrown at Trier by Cerealis, and 113 senators emigrated to Germany (70). Mainly on account of its strategic position, Diocletian, on his reorganization of the empire, made Trier the capital not only of *Belgica Prima,* but of the whole "diocese" of Gaul. Constantine the Great, who generally resided here from 306 to 331, and his successors, beautified the city with public works, and villas arose upon the hillsides.

The Franks, who had thrice previously sacked the city, gained permanent possession of it about 455. The city passed to Lorraine in 843, and to the East Frankish kingdom in 870. Hetti, who occupied the see from 814 to 847, is said to have been the first Archbishop of Trier, and Radbod acquired the temporal rights of the counts of Trier in 898. In the 10th century Archbishop Dietrich I. obtained the primacy over Gaul and Germany.

The temporal power of the archbishops was not gained without opposition. The German kings Otto IV. and Conrad IV. granted charters to the city, which, however, admitted the jurisdiction of its archbishop, Baldwin of Luxembourg, in 1308. This prince, a brother of the emperor Henry VII., ruled from 1307 to 1354 and was the real founder of the power of Trier. He raised it to great prosperity by his foresight, and chiefly as a result of the active support he rendered to the emperors Henry VII., Louis the Bavarian, and Charles IV., enlarged his dominions almost to their ultimate extent. He assumed the title of arch-chancellor of Gaul and Arles (or Burgundy), and thenceforward the elector of Trier held the third place in the electoral college. After Baldwin's death the prosperity of Trier was checked by wars and disputes between rival claimants to the see, and in 1456 the estates united for the purpose of restoring order and secured the right of electing their archbishops.

Throughout the middle ages the *sancta civitas Trevirorum* was a great seat of monastic learning. The university, founded in 1473, existed until 1797. The elector Richard von Greiffenklau (1467–1531) successfully opposed the Reformation and inaugurated the exhibitions of the holy coat, which called forth the denunciations of Luther but long after his time continued to bring wealth and celebrity to the city. In the latter half of the 16th century education fell into the hands of the Jesuits.

The last elector and archbishop, Clement Wenceslaus (1768–1802), granted toleration to the Protestants in 1782, established his residence at Coblenz in 1786, and fled from the French in 1794. In 1814 nearly the whole of the former electoral dominions were given to Prussia. A bishopric was again founded in 1821, but it was placed under Cologne. The area of the former electoral principality covered a broad strip of territory along the lower Saar and the Moselle from its confluence with that river to the Rhine, with a district on the right bank of the Rhine behind Ehrenbreitstein. The chief towns in addition to Trier were Coblenz, Cochem, Beilstein, Oberwesel, Lahnstein, and Sayn. The territory under the spiritual authority of the archbishop included the bishoprics of Metz, Toul, and Verdun, and after 1777 also those of Nancy and St. Dié.

At the close of 1918, after the Armistice, the town of Trier was occupied by units of the Third American Army, the last of which returned to the United States in 1923.

See J. N. von Wilmowsky, *Der Dom zu Trier in seinen drei Hauptperioden* (Trier, 1874); S. Beissel, *Geschichte der trierer Kirchen* (Trier, 1888); G. Kentenich, *Geschichte der Stadt Trier* (Trier, 1915).

TRIESTE, formerly Austrian, but ceded to Italy under the Treaty of S. Germain in 1918, a seaport in the district of Venezia Giulia, Italy, capital of the province of Trieste and an episcopal see, situated at the north-east angle of the Adriatic sea, on the Gulf of Trieste, is picturesquely built on terraces at the foot of the Carso. Pop. (1921) 228,523 (town), 238,655 (commune). It is divided into the old and the new town, which are connected by the broad and handsome Via del Corso, the busiest street in the town. The old town, nestling round the hill on which the castle stands, consists of narrow, steep and irregular streets. The new town, which lies on the flat expanse adjoining the crescent-shaped bay, partly on ground that has been reclaimed from the sea, has large and regularly-built streets.

The Austrian-Lloyd Steam Navigation company, which for many years has had its headquarters at Trieste, is now the Lloy Triestino company, and controls several shipbuilding establis ments; it has recently united with the Cosulich company. Th is also a large yard at Muggia (3 m. to the S.) with about 1,0 workmen; the other industries include petroleum refineries, ir foundries, chemicals, soap-boiling, silk and cotton spinning, j works, the production of canned fish, soap, beer and preserv distilleries, etc.; there are steel works at Servola (three sm ers). Several marble quarries are worked in the neighbourho and there are some large cement factories. Good wine, fruit a olive oil are the most important natural products of the coun round Trieste. Under Austria, Trieste owed its development its geographical situation in the north-east angle of the Adria sea at the end of the deeply indented gulf, and to its harbo which was more accessible to large vessels than that of Ven Besides, it was declared a free imperial port in 1719, and therefore released from the obstruction to trade contained the hampering legislation of the period. It was deprived of privilege in 1891, when only the harbour was declared to outside the customs limit. With the 20th century an act policy was inaugurated. New and direct services were star to East Africa, Central America and Mexico; the service India and the Far East, as well as that to the Mediterran ports, was much improved, and Trieste was made the centre the large emigration from Austria to America by the inaugurat of a direct emigrant service to New York. Railway communi tions were also improved, and Trieste, besides being the princi port of Austria, was the centre port for much of Germany's tr with the Mediterranean and the East. In 1924 Trieste recove 95% of her pre-war trade, but this abnormal "boom" was maintained, and the competition of Hamburg is being felt.

In 1926, 27,438 ships entered and cleared the port (total t nage 8,817,124), dealing with 1,700,099 passengers; and in 19 1,656,935 tons of goods were imported, and 813,500 were export In 1925, 201 ships with a tonnage of 621,015 were registered the district (compartimento) of Trieste.

Trieste is connected by rail with Monfalcone (branch Gorizia and Udine, Treviso and Venice (another line to Gor runs across the Carso), with Postumia Grotte, the frontier stat on the line to Lubiana, with Parenzo and with Pola, and by e tric railway with Villa Opicina.

About 4 m. N.W. of Trieste on the very edge of the sea the famous castle of Miramare, built in 1854–56 for the archd Maximilian, the ill-fated emperor of Mexico.

History.—After the break-up of the Roman dominion Trie shared the general fortunes of Istria. From the emperor Lotl II. (in 948) it received an independent existence under its cou bishops, and it maintained this position down to its capture Venice in 1202. For the next 180 years its history cons chiefly of a series of conflicts with this city, which were fin put an end to by Trieste placing itself in 1382 under the pro tion of Leopold III. of Austria. The overlordship thus establis insensibly developed into actual possession; and except in Napoleonic period (1797–1805 and 1809–13) Trieste remai an integral part of the Austrian dominions until 1918, tho always a centre of Italian irredentist feeling. It was an impe free port from 1719 until 1891.

See Giulio Caprin, *Trieste* (Bergamo, 1906); A. Tamaro, *Stori Trieste* (Trieste, 1924).

TRIFOLIUM, the generic name of the plants commo called clover (*q.v.*), from the Latin *tres,* three and *folium,* a l

TRIFORIUM, in architecture, a longitudinal passage gallery of a church or other high ceiled interior, the triforium f being usually above a side aisle vault or ceiling. The usage the term is loose; by some it is applied to any second floor gal opening on to a higher nave by means of arcades or colonna like the galleries occurring in some pagan Roman basilicas similar galleries in Byzantine churches. In other cases its us is limited to an arcaded gallery above the side aisle of a media church and below the clerestory windows, thus occupying height of the side aisle lean-to roof. The triforium became integral part of interior church design during the Romanes

nd, sometimes merely as a series of openings to light and ilate the roof space, and sometimes as a complete open gal- often vaulted with a quarter circle vault, which transmitted hrust of the main nave vault to the outside walls, as in the ch of S. Cernin at Toulouse (begun 1096). With the develop- of articulated Gothic vaulting in France the usage became used. At times there was a complete vaulted gallery over the aisle, which created a lower triforium; in the height of the to roof over this a second, minor triforium was developed, Laon cathedral (1160–1205), and in Noyon (1150–1200).

Notre Dame at Paris (1163–96) the upper triforium was nally represented by a series of simple, round openings with mentary tracery opening to the roof space. The change in e Dame, in the rebuilding (between 1240–58), by which the roofs were flattened, the clerestorey windows heightened and circular openings eliminated, shows the 13th century dissatis- on with the old four stage composition, and the upper vaulted ry is found in few churches of the developed Rayonnant pe- Chartres cathedral (1194–1212), Reims cathedral (begun) and Amiens (1220–47) all show triforia of little relative ht, but of rich arcading and, in the last, the central mullion of clerestorey tracery is carried down through the triforium ar- ng, so as to bind clerestorey and triforium into one composi- In the apse of Amiens, moreover, the flatness of the side roofs allows windows to be placed behind the triforium ar- ng, which thus becomes, as it were, merely a decorated base to slim clerestorey above. This development reaches its climax in church of S. Urbain at Troyes (1262–80), in which the tri- um gallery completely disappears as a separate motif, although faintly recalled by the tracery of the clerestorey windows. the Flamboyant period the entire omission of the triforium mes the rule. The English love of horizontal lines shows in eat development of the triforium gallery as an important dec- ive element in church interiors. In both Norman and Gothic it is relatively much higher than in similar work in France, n almost equalling the pier arcades. It frequently receives the est possible treatment, by the use of both tracery and sculp- The richest and most characteristic example is the angel r at Lincoln (completed 1282). In the 15th century the lency toward height of pier arcade and clerestorey window, so rly shown in Perpendicular work generally, leads to the ked reduction in importance and the final disappearance of triforium. (*See* BYZANTINE AND ROMANESQUE ARCHITECTURE; HIC ARCHITECTURE.) (T. F. H.)

RIGONOMETRY. To compute numerical results for ch geometry would require diagrams plotted to scale is the function of trigonometry. Such problems as relate to a figure g wholly in one plane constitute *plane trigonometry;* princi- y the calculations of certain unknown distances and angles n other known or measured distances and angles. Problems se diagrams lie in two or more different planes of three-di- sional space are comprised in *spherical trigonometry.* Their tion to a sphere will be shown below. Algebraical discussion uch computations or calculations forms what is called *theoret- trigonometry,* while the numerical work is called concrete or *ctical trigonometry.*

PLANE TRIGONOMETRY

ll solutions of problems of distance and direction in a plane end upon finding unknown parts of a triangle when three s are known (or "given"). Most simply, these may be sides angles, at least one being the length of one side. For cal- tions involving the size of an angle, the ratios of sides in a t triangle are employed, a right triangle having one angle equal he given angle, or differing from it by some even number of t angles; or the *supplement* of such an angle. For convenience measurement and uniformity of language a technical system is pted, as follows:

he angle to be measured is depicted in a vertical plane, facing observer. The angle is defined by one straight segment *OA,* ed its *initial side,* and a second segment *OB,* its *terminal side.* s often said to be *generated* by the continuous rotation of a straight segment about the point *O,* from the position *OA* to the position *OB.* Since this rotation has two conceivable directions or senses, one is called the negative sense, namely, that performed by the hands of a clock as seen by an observer standing before its face; the opposite sense of rotation is called positive. If one could stand at the position of the north pole-star and face toward the sun, the planets of our solar system would appear in their orbits to revolve in the positive sense about the sun.

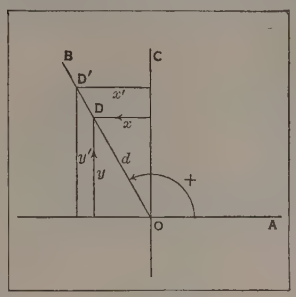


FIG. 1

Fix arbitrarily a point *D* on the terminal segment (fig. 1), and let *d* denote the distance *OD.* Draw a line *OC* perpendicular to *OA* and measure the Cartesian coordinates *x* and *y* of *D,* taking as *x* the distance of *D* from the line *OC* (right or left), and *y* its distance above or below the initial line or that line produced in the direction *AO.* The indefinitely extended lines *OA* and *OC* are termed the axes of coordinates (*see* COORDINATES) in this diagram, *OA* being the *x* axis and *OC* the *y* axis; so that *x* coordinates are parallel to the *x* axis, *y* coordinates parallel to the *y* axis. Coordinates are measured from an axis, to the point *D,* and are positive for an acute angle. Hence on the diagram which is used here, a positive *x* extends from the *y* axis toward the observer's right, a negative *x* toward his left; a positive *y* upward from the *x* axis, a negative *y* downward. These conventional definitions enable us to characterize the picture of any real angle by three real numbers, *d, x* and *y.* But any new selection of the point *D* on the terminal line, as *D′,* would give a second set of numbers, *d′, x′, y′,* which are proportional to *d, x* and *y.* Accordingly not these numbers, but their ratios, are chosen to describe or measure the angle.

Trigonometric Functions or Ratios, of an Angle.—Six names are assigned to the six ratios of the numbers, *x, y, d.* Some symbol, as *K,* is used for the angle. Then

y/d	is	called	the	sine of K, or $\sin K = y/d$
x/d	,,	,,	,,	cosine of K, or $\cos K = x/d$
y/x	,,	,,	,,	tangent of K, or $\tan K = y/x$
x/y	,,	,,	,,	cotangent of K, or $\cot K = x/y$
d/x	,,	,,	,,	secant of K, or $\sec K = d/x$
d/y	,,	,,	,,	cosecant of K, or $\operatorname{cosec} K = d/y$

By definition three of these six are reciprocals of three others;

$$\cot K = 1/\tan K,\ \sec K = 1/\cos K,\ \operatorname{cosec} K = 1/\sin K.$$

The sine is also the product of two others; $\sin K = \cos K \cdot \tan K$. Since also the Pythagorean relation connects *x, y* and *d,*—viz., $x^2+y^2=d^2$,—there are quadratic relations or identities among the six ratios. One of these is $\sin^2 K + \cos^2 K = 1$. By the use of these five relations or any equivalent set, when the numerical value of any one ratio or function is known the five others can be found numerically, but not always their plus or minus sign. If however the *sign* of a second ratio is given, a ratio not the reciprocal of the first, then the rest can be found completely.

Limits of Values of the Six Functions.—From the fact that *d* is numerically greater than either *x* or *y,* and that either one of the latter may become equal to zero for some angle which is a whole number of right angles, it is seen that two functions of real angles have outer boundaries, two have inner boundaries, and two are unbounded.

$$-1 \leqq \sin K \leqq (+1), \quad \sec K \geqq (+1) \text{ or } \sec K \leqq (-1),$$

$$-1 \leqq \cos K \leqq (+1), \quad \operatorname{cosec} K \geqq (+1) \text{ or } \operatorname{cosec} K \leqq (-1),$$

$\tan K$ and $\cot K$ are unlimited in value.

Unit of Real and Imaginary Angles.—In geometry the unit of angle, a *degree,* was defined as one ninetieth part of a right angle, a *degree* is divided into sixty equal parts called *minutes,* and each minute into sixty equal parts called *seconds.* In terms of these units an angle can be described by three whole numbers if it

does not demand more precise measurement, or it may be described by the aid of a decimal fraction of a unit. Astronomers use degrees, minutes, seconds, and often tenths and hundredths of a second. Land surveyors use degrees and minutes, and sometimes tenths of a minute. For purely theoretical discussions a larger unit is usually employed. This is the *radian* and is best described by saying that π radians are the same as 180 degrees. Using the symbols °, ′, ″ for degrees, minutes, seconds, we may say that

$$1 \text{ radian} = 57°{\cdot}2957796 = 57°17'44''{\cdot}81$$
$$1 \text{ degree} = 0{\cdot}01745329 \text{ radians.}$$

Glaisher has calculated the value of the radian to 41 places of decimals.

In calculations regarding angles it may happen that data are used which do not admit the construction of a *real* triangle (or other figure that is sought); then the impossibility will come to light when either: (*a*) the value of some function is given by an equation whose roots are imaginary, or (*b*) the numerical value of some function is excluded by the above statement of boundary values. In either case, (*a*) or (*b*), the angle is said to be *imaginary*.

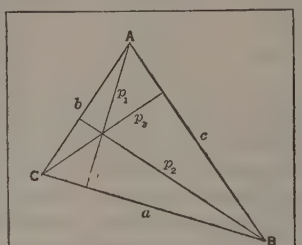

FIG. 2

Dissection of an Oblique Triangle into Right Triangles.—From any vertex of an oblique triangle a perpendicular may be drawn to the opposite side. In three ways, therefore, the oblique triangle may be looked at as the sum, or the difference, of two right triangles. Then, in fig. 2, we have

$$p_1 = b \sin C = c \sin B$$
$$p_2 = a \sin C = c \sin A$$
$$p_3 = a \sin B = b \sin A$$

These equalities give first the

Law of Sines: $$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C};$$

and secondly the three equivalent expressions for the area T of this triangle:

$$T = \tfrac{1}{2}ap_1 = \tfrac{1}{2}bp_2 = \tfrac{1}{2}cp_3$$
$$= \tfrac{1}{2}ab \sin C = \tfrac{1}{2}bc \sin A = \tfrac{1}{2}ca \sin B.$$

In this diagram each side is the algebraic sum of two bases of right triangles, and each base is the product of one side of the triangle multiplied by the cosine of an angle. The three equations from this source are

$$a = b \cos C + c \cos B,$$
$$b = c \cos A + a \cos C,$$
$$c = a \cos B + b \cos A.$$

Two cosines can be eliminated from these equations, leaving a relation among three sides and one angle:

$$b^2 + c^2 - a^2 = 2bc \cos A,$$

or

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}.$$

By this formula the angles can be computed when the three sides are known, if a table of cosines is available. Or, in terms purely geometric, this formula, and the two similar ones for cos *B* and cos *C*, reduce the problem from that of constructing the angles of an oblique triangle whose sides are given to that of constructing the angles of a right triangle when the ratio of two sides is given.

Addition of Angles.—The addition theorem, the most comprehensive formula in theoretical trigonometry, results easily from these cosine-equations and the rule of proportionality of sides and sines in a triangle. Since $A+B+C=180°$, $\sin C = \sin (A+B)$. Also if in a given triangle the ratio $a/\sin A = m$, then $a = m \sin A$, $b = m \sin B$, and $c = m \sin (A+B)$. By these substitutions t third cosine-equation above becomes:

$$m \sin (A+B) = m \sin A \cos B + m \sin B \cos A.$$

This gives the following relation, identically true when A and are positive real angles with a sum less than 180°:

$$\sin (A+B) = \sin A \cos B + \sin B \cos A.$$

Similar substitutions are made in the formula for cos *C*,

$$-\cos C = \frac{c^2 - a^2 - b^2}{2ab} = \frac{m^2(\sin^2 C - \sin^2 A - \sin^2 B)}{2m^2 \sin A \sin B}$$
$$= \frac{\sin^2(A+B) - \sin^2 A - \sin^2 B}{2 \sin A \sin B}$$
$$= \frac{\sin^2 A(\cos^2 B - 1) + \sin^2 B(\cos^2 A - 1) + 2 \sin A \sin B \cos A \cos}{2 \sin A \sin B}$$
$$\therefore -\cos C = \cos(A+B) = \cos A \cos B - \sin A \sin B.$$

The two formulae for sin $(A+B)$ and cos $(A+B)$ are term the *addition theorem* for the sine and cosine. Either may derived from the other, together with the statements that suppl mentary angles have equal sines and that their cosines are nume cally equal but unlike in sign. They are valid not only within t limits already stated for A and B, but for real angles of any ma nitude, positive or negative. Demonstration of this univers validity is conveniently made by adding 90° to one angle (as A at a time and observing that $\sin (A+90°) = \cos A$, $\cos (A+90$ $= -\sin A$, and the same for $(A+B+90°)$ and $(A+B)$. Such i crease of $A+B$ and A is found to exchange the formulae for s $(A+B)$ and cos $(A+B)$, whence it is inferred that they are tr for angles differing by entire multiples of 90° from acute angl Further, for imaginary angles the definitions of sine and cosi are taken subject to the postulate that these addition theore shall remain true.

Functions of Multiples of 90°.—When an angle becomes exact multiple of 90°, the prescribed rules for constructing x, and d will give either $d=x$, $y=0$ or $d=y$, $x=0$. This gives sine and cosine the values in this table:

	0°	90°	180°	270°
sine	0	1	0	−1
cosine	1	0	−1	0

Tangent and cotangent become, for such angles, either zero infinitely great (0 or ∞).

Functions of Double Angles and Half Angles.—Equal angl $A=B$, give for sin $(A+B)$ and cos $(A+B)$ the two formulae:

$$\sin 2A = \sin(A+A) = 2 \sin A \cos A,$$
$$\cos 2A = \cos(A+A) = \cos^2 A - \sin^2 A$$
$$= 2\cos^2 A - 1$$
$$= 1 - 2\sin^2 A.$$

The latter gives both the following relations:

$$\sin A = \sqrt{\left(\frac{1 - \cos 2A}{2}\right)}, \quad \cos A = \sqrt{\left(\frac{1 + \cos 2A}{2}\right)},$$

which relations are commonly quoted in the form:

$$\sin \tfrac{1}{2}A = \sqrt{\left(\frac{1 - \cos A}{2}\right)}, \quad \cos \tfrac{1}{2}A = \sqrt{\left(\frac{1 + \cos A}{2}\right)},$$
$$\tan \tfrac{1}{2}A = \sqrt{\left(\frac{1 - \cos A}{1 + \cos A}\right)}.$$

This permits a more convenient solution for the angles of triangle when the three sides are given. The substitution $\frac{b^2 + c^2 - a^2}{2bc}$ for $\cos A$, with easy factoring, gives

$$\tan \tfrac{1}{2}A = \sqrt{\left[\frac{(b+a-c)(c+a-b)}{(b+c-a)(a+b+c)}\right]},$$

and this allows the use of logarithms in multiplication and t extraction of a square root.

actorizing Formulae.—For a more expeditious calculation n logarithms are used, the sum or difference of two sines or wo cosines can be factored. To factor the sum, $\sin P+\sin Q$, angle is taken as the sum of two auxiliary angles, and the r as their difference, thus:

$$P=A+B,\ Q=A-B;\ A=\tfrac{1}{2}(P+Q),\ B=\tfrac{1}{2}(P-Q).$$

addition theorem is then applied for $A+B$ and $A-B$, as ows:

$$\sin P+\sin Q=\sin(A+B)+\sin(A-B)$$
$$=2\sin A\cos B$$
$$=2\sin\tfrac{1}{2}(P+Q)\cos\tfrac{1}{2}(P-Q).$$

ilarly, $\sin P-\sin Q=2\cos\tfrac{1}{2}(P+Q)\sin\tfrac{1}{2}(P-Q)$,

$\cos P+\cos Q=2\cos\tfrac{1}{2}(P+Q)\cos\tfrac{1}{2}(P-Q)$,

$\cos P-\cos Q=-2\sin\tfrac{1}{2}(P+Q)\sin\tfrac{1}{2}(P-Q)$,

$\sin P+\cos P=2\sin(45°+P)\cos 45°$,

$\cos P-\sin P=2\cos(45°+P)\sin 45°$.

first two of these give a useful rule when two sides of a tri-le and the included angle are known. Since $\sin A/\sin B=a/b$,

$$\frac{a-b}{a+b}=\frac{\sin A-\sin B}{\sin A+\sin B}=\frac{2\cos\tfrac{1}{2}(A+B)\sin\tfrac{1}{2}(A-B)}{2\sin\tfrac{1}{2}(A+B)\cos\tfrac{1}{2}(A-B)}$$
$$=\frac{\tan\tfrac{1}{2}(A-B)}{\tan\tfrac{1}{2}(A+B)}=\tan\tfrac{1}{2}(A-B)\tan\tfrac{1}{2}C.$$

er formulae for transformation purposes are derived from the ition theorem and the primitive reciprocities and Pythagorean tions, together with the premise that, in a plane triangle, $B+C=180°$. Of frequent use are the formulae for radii of circles inscribed and circumscribed respectively to a triangle:

$$r=\sqrt{\left[\frac{(a+b-c)(a-b+c)(-a+b+c)}{4(a+b+c)}\right]},$$

$$R=\frac{abc}{\sqrt{[(a+b+c)(a+b-c)(a-b+c)(-a+b+c)]}}.$$

alculation of Tables.—When the radian is used as unit, ll angles like 1° or 5° are represented by decimal fractions than 0·1. The sine and cosine of x radians are represented by vergent series in ascending powers of x:

$$\sin x=x-\frac{x^3}{3!}+\frac{x^5}{5!}-\frac{x^7}{7!}+\cdots,$$

$$\cos x=1-\frac{x^2}{2!}+\frac{x^4}{4!}-\frac{x^6}{6!}+\cdots.$$

$x\leqq\frac{5}{180}\pi$, these functions can be computed with no error in 10th decimal place by using five terms of the series. For er angles, more terms can be used, or the addition theorem be employed. From 15° up to 45° it saves labour to apply the tions

$$\sin(30°\pm x)=\tfrac{1}{2}\cos x\pm\frac{\sqrt{3}}{2}\sin x,$$

$$\cos(30°\pm x)=\frac{\sqrt{3}}{2}\cos x\mp\tfrac{1}{2}\sin x.$$

ond 45° of course no further calculation is necessary, since

$$\sin(45°+x)=\cos(45°-x),$$
$$\cos(45°+x)=\sin(45°-x).$$

st sets of trigonometric tables therefore give values of the ous functions for angles from 0° to 45°, and apply a system of ble titles for completing the first quadrant.

Multiples of an Angle. De Moivre's Formula.—The in-ption of regular polygons in a circle is parallel to the solution n algebraic equation for $\sin x$ or $\cos x$ when $\sin(nx)$ or $\cos$) is a known quantity, n denoting any integer. To express $\sin$) in terms of $\sin x$ is a problem for the addition theorem of s. It is shortened by De Moivre's (or Euler's) formula, itself a direct consequence of that addition theorem. Denote by i the imaginary unit $\sqrt{-1}$. The formula is this:

$$\cos(nx)+i\sin(nx)=(\cos x+i\sin x)^n.$$

The binomial theorem gives the expansion of the second member, terms in odd powers of $\sin x$ being imaginary, while the first and alternate terms are real. The sum of real terms is then the desired expression for $\cos(nx)$; the others, divided by i, give $\sin(nx)$. Compare the treatment of hyperbolic functions, below.

Trigonometric or Fourier Series.—Many functions, especially periodic functions, can be calculated most easily by convergent series proceeding by sines, or cosines (or both), of integral multiples of a variable angle. This topic is best treated in differential calculus (*see* CALCULUS). An interesting example, of little value, however, is this:

$$\frac{x}{2}=\sin x-\frac{\sin 2x}{2}+\frac{\sin 3x}{3}-\frac{\sin 4x}{4}+\cdots.$$

SPHERICAL TRIGONOMETRY

Figures composed of lines and points in a plane are accessible to computation through triangles, and these in turn through right triangles. In the totality of lines and planes radiating from a point in ordinary space of three dimensions the useful instrument for computation is that consisting of three lines or rays—half lines starting from a common point—and the three plane angles which are bounded each by two of these three lines. It is usually agreed to restrict these angles to be not over 180° each, and to fix the same limit for the dihedral angles whose edges are the three lines first mentioned. The plane angles are called *face-angles,* angles formed by two planes at any edge are *dihedral angles,* and the complete figure of six parts is a *trihedral* or *solid angle.* If the point (or vertex) lies at the centre of a sphere, the edges and faces cut the spherical surface in points and arcs of great circles that constitute a spherical triangle. The sides and angles of this spherical triangle have the same measures (in degrees or radians) as the plane and dihedral angles of the trihedral angle. The capitals A, B, C may be used for the positions and for the measures of the angles at the vertices, and a, b, c for the measures of the three plane angles (face angles) of the arcs of the triangle.

Right Trihedral Angles or Spherical Triangles.—If two planes of the trihedral angle are perpendicular, *e.g.,* if the angle C of the intercepted spherical triangle is 90°, the latter is a *right spherical triangle* and subtends a right trihedral angle. If a side (a face angle) is 90°, the triangle and its trihedral angle are called a *quadrantal triangle.* In contrast to the plane triangle, two or even three angles of the triangle may be right angles; in the one case two and in the other case three of the sides will then be quadrants or quarter-circles of the sphere, and the triangles will be biquadrantal, or else equilateral (trirectangular or triquandrantal).

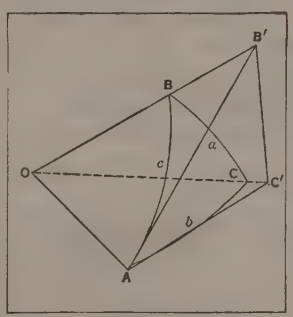

FIG. 3

Let a trihedral angle at O, the centre, intercept on a sphere of radius R a right spherical triangle ABC, right angled at C. Then the planes AOC and BOC will be perpendicular along the edge OC. (Fig. 3.) To measure the angle whose edge is OA, let a plane perpendicular to OA cut OB in B', and OC in C'. There is then formed a figure in which all four triangles are right triangles, viz., OAB', OAC', $OB'C'$ and $AB'C'$. In three of these, the ratios of edges are trigonometric functions of c, b, a; in the other, they are functions of the angle A or of the dihedral angle OA. We may write from inspection these three relations:

$$\sin A=\frac{\sin a}{\sin c},\ \cos A=\frac{\tan b}{\tan c},\ \tan A=\frac{\tan a}{\sin b}.$$

Similar construction beginning from the edge OB gives the three

formulae:

$$\sin B=\frac{\sin b}{\sin c},\quad \cos B=\frac{\tan a}{\tan c},\quad \tan B=\frac{\tan b}{\sin a}.$$

By proper elimination, four more relations, each among three parts of the spherical right triangle, can be derived algebraically from these six, as follows:

$$\cos c=\cos a\cos b,\qquad \cos c=\cot an A\cot an B,$$
$$\cos A=\cos a\sin B,\qquad \cos B=\cos b\sin A.$$

The ten formulae suffice for computing any desired part when two parts beside the right angle are given. The last three of these ten determine the sides when two angles are given, a case having no parallel in plane triangles.

Napier's Rules.—Two "Napier's Rules" form a mnemonic for these ten relations. They relate not to the actual parts (viz., a, B, c, A, b, C), but to a set of so-called "Napier's Parts," amongst which the right angle C does not appear. These are thought of as follows:

$$a,\ 90°-B,\ 90°-c,\ 90°-A,\ b,\ a,\ 90°-B,\ \text{etc.},$$

in cycle. Each Napier's part is *adjacent* to two in the cycle, the one next preceding and the one immediately following it in the cycle. The rules read:

1) The *sine* of any middle part is the product of the *tangents* of the *adjacent* parts,

2) The *sine* of any middle part is the product of the *cosines* of the *opposite* parts.

Here *opposite* means *non-adjacent*. When any three Napier's parts are specified, of the five excluding the right angle C, either they are consecutive in the cycle, and then the first and third are called *adjacent* to the second; or only two are consecutive, in which case they are both called opposite to the third. These formulae solve most of the problems arising in geodetic navigation, and the problems of celestial astronomy concerning an altitude and an azimuth.

Polar Triangles: Quadrantal Triangles.—There is a unique relation between two trihedral angles, each *polar* to the other. The interior and exterior spaces of a trihedral angle must be defined. Given three half-lines OA, OB, OC, and the plane angles, each less than 180°, which they bound, produce indefinitely AO, BO, and CO, to A_1, B_1, and C_1. Through O draw any other line DOD_1, not in any face plane (fig. 4). If from D_1, but not from D, a point can move continuously to A_1 without crossing the interior of any face angle or any edge, then D is an interior point and D_1 is an exterior point. If both D_1 and D can be so moved, then both are exterior to the trihedral angle O—ABC. Take D an interior point, and from it draw three half-lines intersecting perpendicularly the three faces of the first trihedral angle. On the half-line perpendicular to AOB mark any point C_2, and similarly mark two other points A_2, B_2. The edges DA_2, DB_2, DC_2, define a second trihedral angle called *polar* to the first. The relations of perpendicularity among lines and planes show that also the first is polar to the second trihedral angle. In solid geometry it is shown, as is visible if one will construct a model, that each dihedral angle in either is the supplement of a face-angle in the other. If the first is a right-trihedral angle (spherical triangle), the second is quadrantal, and vice versa. There is no need of new formulae for a quadrantal triangle, since the ten given already for a right triangle can be altered by merely exchanging small letters for capitals and reciprocally, and changing the sign prefixed to every *cosine*.

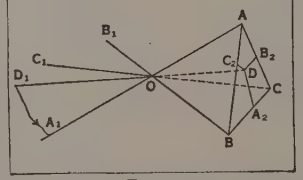

FIG. 4

Oblique Spherical Triangles.—When no angle is right, then from any point in an edge OC two planes can be passed, each perpendicular to one other edge, both therefore containing a line CX, of length p, perpendicular to the plane AOB (fig. 5). From such a figure it is seen that

$$\frac{\sin A}{\sin B}=\frac{\sin a}{\sin b}\ \text{since}\ \frac{p/l_1}{p/l_2}=\frac{l_2/r}{l_1/r}.$$

From this, since A and B were any two angles of the triang there follows the *sine theorem* for eve trihedral angle or spherical triangle,

$$\frac{\sin A}{\sin a}=\frac{\sin B}{\sin b}=\frac{\sin C}{\sin c}.$$

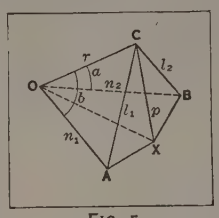

FIG. 5

From a slightly different diagram (fig. come formulae connecting three faces a a dihedral angle, or three angles and a fa

At a point C on one edge, perpendicul to OC are erected, terminating in A and on the two other edges; also a perp dicular k to the segment AB at P. This point P is now c nected to O by h, and other parts of the six right triangles lettered as in the accompanying sket We then have the face angle $C=\alpha+$ now call the corresponding parts angle C,

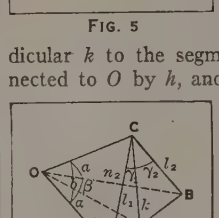

FIG. 6

γ_1 and γ_2, and we have $C=\gamma_1+\gamma_2$

Applying the addition theorem for cosi and referring the segments involved t by ratios in right triangles, we have

$$\cos c=\cos(\alpha+\beta)=\cos\alpha\cos\beta-\sin\alpha\sin\beta=\frac{h^2-m_1m_2}{n_1n_2},$$

$$\cos C=\cos(\gamma_1+\gamma_2)=\cos\gamma_1\cos\gamma_2-\sin\gamma_1\sin\gamma_2=\frac{k^2-m_1m_2}{l_1l_2}.$$

Hence $$r^2=h^2-k^2=n_1n_2\cos c-l_1l_2\cos C,$$

$$1=\frac{n_1}{r}\cdot\frac{n_2}{r}\cos c-\frac{l_1}{r}\cdot\frac{l_2}{r}\cos C=\frac{\cos c}{\cos a\cos b}-\tan a\tan b\cos C,$$

or $$\cos c=\cos a\cos b+\sin a\sin b\cos C,$$

whence also $$\cos a=\cos b\cos c+\sin b\sin c\cos A,$$

and $$\cos b=\cos c\cos a+\sin c\sin a\cos B.$$

But this trihedral angle is the polar of another, for which th same three cosine formulae are true. In them we may substit for face-angles and dihedrals the *supplements* of the dihedr and of the face-angles respectively, cosines and tangents versing sign. The results are, for this first trihedral angle,

$$\cos A=-\cos B\cos C+\sin B\sin C\cos a,$$
$$\cos B=-\cos C\cos A+\sin C\sin A\cos b,$$

and $$\cos C=-\cos A\cos B+\sin A\sin B\cos C.$$

From set (1), dihedral angles may be calculated in terms of face-angles; but derived formulae for halves of the dihedr are more convenient for logarithmic computation, as when plane triangles the angles are to be found from the sides. Si

$$\cos A=\frac{\cos a-\cos b\cos c}{\sin b\sin c},$$

it follows that

$$\sin^2\tfrac{1}{2}A=\frac{1-\cos A}{2}=\frac{\cos(b-c)-\cos a}{2\sin b\sin c}$$
$$=\frac{2\sin\tfrac{1}{2}(b-c+a)\sin\tfrac{1}{2}(a-b+c)}{2\sin b\sin c}$$

or, if $a+b+c=2s$,

$$\sin^2\tfrac{1}{2}A=\frac{\sin(s-b)\sin(s-c)}{\sin b\sin c};$$

and similarly $$\cos^2\tfrac{1}{2}A=\frac{\sin s\cdot\sin(s-a)}{\sin b\cdot\sin c};$$

and $$\tan\tfrac{1}{2}A=\sqrt{\left[\frac{\sin(s-b)\cdot\sin(s-c)}{\sin s\cdot\sin(s-a)}\right]}.$$

he polar triangle converts these formulae into expressions half-sides in terms of the three dihedral angles; or they may derived in the same way from set (2) above. They are, when enotes $\frac{1}{2}(A+B+C)$,

$$\sin^2\frac{a}{2}=\frac{-\cos S\cos(S-A)}{\cos B\cos C}, \quad (6)$$

$$\cos^2\frac{a}{2}=\frac{\cos(S-B)\cos(S-C)}{\cos B\cos C}, \quad (7)$$

$$\tan\frac{a}{2}=\sqrt{\left[-\frac{\cos S\cos(S-A)}{\cos(S-B)\cos(S-C)}\right]}. \quad (8)$$

auss's Equations.—The *Gauss equations* are four relations ucible from (3), (4), (6), and (7). Restrict the trihedrals aving positive face-angles less than 180°, and dihedral angles h the same limitations; then the right-hand members of equaıs (3), (4), (6) and (7) are all positive, and their positive are roots must be taken. From the set represented by (3) and , substitute in the addition formula

$$\sin\tfrac{1}{2}(A+B)=\sin\frac{A}{2}\cos\frac{B}{2}+\cos\frac{A}{2}\sin\frac{B}{2},$$

l thus find

$$\frac{c}{2}\sin\tfrac{1}{2}(A+B)=\cos\frac{c}{2}\sqrt{\left[\frac{\sin s\sin(s-c)}{\sin a\sin b\sin^2 c}\right]}\cdot[\sin(s-b)+\sin(s-a)]$$

$$=\cos\frac{C}{2}\cos\frac{a-b}{2}.$$

t very different are three other proofs. The set of four is :

$$\begin{aligned}
\cos\frac{a}{2}\sin\tfrac{1}{2}(B+C)&=\cos\frac{A}{2}\cos\tfrac{1}{2}(b-c),\\
\cos\frac{a}{2}\cos\tfrac{1}{2}(B+C)&=\sin\frac{A}{2}\cos\tfrac{1}{2}(b+c),\\
\sin\frac{a}{2}\sin\tfrac{1}{2}(B-C)&=\cos\frac{A}{2}\sin\tfrac{1}{2}(b-c),\\
\sin\frac{a}{2}\cos\tfrac{1}{2}(B-C)&=\sin\frac{A}{2}\sin\tfrac{1}{2}(b+c).
\end{aligned} \quad (9)$$

Professor Simon Newcomb is authority for the statement that se equations were first published anonymously by Delambre, hough Gauss was the first to use them in spherical astronomy. is evident that they solve directly any triangle in which three ısecutive parts are known, either two sides and the included gle, or two angles and the side adjacent to both. Where all ts are less than 180°, so that the tangent is a sufficient index the quadrant in which a part lies, Napier's analogies are the ter statement of the solution.

Napier's Analogies.—These analogies are found by division m pairs in set (9), as follows:

$$\frac{\sin\frac{1}{2}(B+C)}{\sin\frac{1}{2}(B-C)}=\frac{\tan\frac{a}{2}}{\tan\frac{1}{2}(b-c)},\quad \frac{\sin\frac{1}{2}(b+c)}{\sin\frac{1}{2}(b-c)}=\frac{\operatorname{cotan}\frac{A}{2}}{\tan\frac{1}{2}(B-C)},$$

$$\frac{\cos\frac{1}{2}(B+C)}{\cos\frac{1}{2}(B-C)}=\frac{\tan\frac{a}{2}}{\tan\frac{1}{2}(b+c)},\quad \frac{\cos\frac{1}{2}(b+c)}{\cos\frac{1}{2}(b-c)}=\frac{\operatorname{cotan}\frac{A}{2}}{\tan\frac{1}{2}(B+C)}.$$

By the use of the polar triangle (or trihedral angle), the alogies are exchanged reciprocally two and two; while of the uss equations, two are exchanged, the others being self-iprocal.

Equations of set (1) or (2), have been used here as fundamental, d that asserting proportionality of four sines, as derivative. different selection is of course possible. While those given ove suffice for the logarithmic solution of spherical triangles m any three given parts, and for checks, there is a great variety other relations adapted to special sets of data, either saving labour or admitting of greater accuracy from the same set of tables.

Hyperbolic Functions.—Trigonometric functions are algebraically related to the sine or cosine. Sine and cosine of a real variable quantity, represented as rectangular coordinates in a plane, define a point whose locus is a circle of unit radius about the origin as centre. They may be defined either by this geometric property; or better, by two absolutely convergent series:

$$\sin\theta=\theta-\frac{\theta^3}{3!}+\frac{\theta^5}{5!}-\frac{\theta^7}{7!}+\cdots,$$

$$\cos\theta=1-\frac{\theta^2}{2!}+\frac{\theta^4}{4!}-\frac{\theta^6}{6!}+\cdots.$$

Both converge for all values of θ, and are periodic with the common modulus 2π. Their relation to the circle is expressed by the identity: $\sin^2\theta+\cos^2\theta\equiv 1$. Further, it is shown in the theory of limits (*see* LIMITS) usually given in treatises on differential calculus, that the relation of these two functions and their derivatives is nearly reciprocal, viz., in radian units,

$$\frac{d(\sin\theta)}{d\theta}=\cos\theta,\quad \frac{d(\cos\theta)}{d\theta}=-\sin\theta;$$

in other words, each is an integral of the differential equation

$$\frac{d^2u}{d\theta^2}=-u.$$

Two functions resembling these in the features mentioned are the *hyperbolic sine* and *hyperbolic cosine*, abbreviated to $\sinh\theta$ and $\cosh\theta$. They are defined by absolutely convergent series:

$$\sinh\theta=\theta+\frac{\theta^3}{3!}+\frac{\theta^5}{5!}+\frac{\theta^7}{7!}+\cdots,$$

$$\cosh\theta=1+\frac{\theta^2}{2!}+\frac{\theta^4}{4!}+\frac{\theta^6}{6!}+\cdots.$$

So far however as a real variable θ is concerned, these functions are not periodic. Their modulus of periodicity is imaginary. The identity connecting them is geometrically the equation of an equilateral (or rectangular) hyperbola,

$$\cosh^2\theta-\sinh^2\theta\equiv 1.$$

Their interest for the physicist or engineer arises from their completely symmetrical or reciprocal differential relations:

$$\frac{d(\sinh\theta)}{d\theta}=\cosh\theta,\quad \frac{d(\cosh\theta)}{d\theta}=\sinh\theta.$$

Both are solutions of the differential equation of the second order

$$\frac{d^2u}{d\theta^2}=+u.$$

Analogous to the trigonometric functions the hyperbolic tangent, cotangent, secant, and cosecant are defined as follows:

$$\tanh\theta=\frac{\sinh\theta}{\cosh\theta},\ \coth\theta=\frac{\cosh\theta}{\sinh\theta},\ \operatorname{sech}\theta=\frac{1}{\cosh\theta},\ \operatorname{cosech}\theta=\frac{1}{\sinh\theta}.$$

The first two are mutually reciprocals: $\tanh\theta\cdot\coth\theta=1$, and are related to the latter two by the equations: $\operatorname{sech}^2\theta=1-\tanh^2\theta$, $\operatorname{cosech}^2\theta=\coth^2\theta-1$.

Like the inverse trigonometric, or circular functions, the inverse hyperbolic functions are usefully represented as integrals. Some writers indeed prefer to define them by integration, as follows:

$$\sinh^{-1}y=\int_0^y\frac{dy}{\sqrt{(y^2+1)}},\quad \cosh^{-1}x=\int_1^x\frac{dx}{\sqrt{(x^2-1)}}.$$

It follows then that

$$\sinh u=\frac{e^u-e^{-u}}{2},\ \cosh u=\frac{e^u+e^{-u}}{2},$$

as at first defined, while

$\sinh^{-1}y=\log[y+\sqrt{(y^2+1)}]$, $\cosh^{-1}x=+\log[x\pm\sqrt{(x^2-1)}]$.

The addition theorem is evidently

$$\sinh(u+v)=\sinh u\cosh v+\cosh u\sinh v,$$

$$\cosh(u+v)=\cosh u\cdot\cosh v+\sinh u\sinh v.$$

Misled by apparent implication in the names, some suppose that the Jacobian elliptic functions $\sin amu$, $\cos amu$, etc., resemble the trigonometric and hyperbolic functions as closely as these sets resemble one another. That this is far from correct may be seen at once by consulting the article on ELLIPTIC FUNCTIONS.

HISTORY

The beginnings of trigonometry in explicit form may perhaps be traced to the lost work of a Greek, Hipparchus of Nicaea (*c.* 140 B.C.), which is said to have comprised twelve books with tables *On Chords of Circles*. Apparently Egyptian builders of the pyramids knew of fixed ratios in similar triangles, and they had a name *seqt* for the cosine of an angle, but there is no known record of tables or of further theory. Three books of Menelaus of Alexandria show that interest in astronomy had induced more progress in spherical than in plane trigonometry. To advance toward its modern form, the science needed more named ratios or functions tabulated, being like a language scantily supplied with nouns. In India, six centuries later, chords were halved, and became what we now call *sines*, appearing in the writings of Āryabhaṭa (*c.* A.D. 500) and Brahmagupta (*c.* A.D. 620). The knowledge of India passed into the keeping of the Arabs, and Al Battani (*c.* A.D. 900) gave names to functions now called cotangent and secant. Still later (*c.* A.D. 1250), there came a systematizer, the Persian Nasîr ed-dîn al-Tûsî, who collected and supplemented older knowledge into a coherent whole. The sine theorem was employed wherever possible; but, lacking the cosine theorem, he resorted when necessary to auxiliary right triangles to solve problems in oblique triangles.

Among modern writers, the first to exhibit trigonometry as a science was the German Johann Müller, better known as Regiomontanus (*c.* 1460). He seems to have invented the tangent, traces of which have been suspected, however, in the ancient Egyptian Ahmes ms. (*c.* 1650 B.C.) while the secant was reintroduced *c.* 1500 by Copernicus. Vieta, in Paris in the latter part of the sixteenth century, brought algebra and particularly algebraic transformations into the service of trigonometry. Euler, in the mid-eighteenth century, recast, simplified, and gave elegance to the body of rules and technique, by this time so necessary for navigation and the physical sciences. The name, trigonometry, probably originated with Pitiscus (Heidelberg, 1593).

The first discoverers of leading theorems and formulae must of course be named with an implied proviso. For plane triangles the sine theorem narrowly missed by Al Battânî and the Spanish Moor Jabir Ibn Aflah (*c.* 1140), was enunciated by Nasîr ed-dîn al-Tûsî (*c.* 1250). The cosine theorem in complete form is first found in Vieta's work of 1593, *Variorum de rebus mathematicis responsorum liber octavus*. The same author restated the tangent theorem in the accepted form of today, in 1593. It stands however unmistakable in the work of a Dane, Thomas Fincke, ten years earlier, save that the angle $\frac{1}{2}(A+B)$ is expressed as $\frac{1}{2}(180-C)$, a form immediately applicable to the usual data. Formulae for finding angles directly from the sides, without auxiliary right triangles, appear first with Rhaeticus of Wittenberg in a work written in 1568, published in 1596. He gives the rule for $\tan\frac{1}{2}A$. Rules for the sine and cosine of the half-angle are certainly as old as Oughtred's *Trigonometrie* of 1657. Proportions for sines and cosines, of $\frac{1}{2}(A+B)$ and of $\frac{1}{2}(A-B)$ are found, the sines in Newton's writings, 1707, and both functions appear in F. W. Oppel's *Analysis Triangulorum*, 1746.

The six triadic relations in spherical right triangles evolved during long centuries, first of course in words stating proportions, later in the short-hand of equations. Menelaus of Alexandria (*c.* A.D. 100) and Ptolemaeus (*c.* A.D. 140) give most of them, and all were known to Nasîr ed-dîn al-Tûsî (*c.* 1250). For oblique spherical triangles, the sine theorem was found by the earl Arabians. It was known to Abû'l-Wefâ (*c.* 980), and possibly his contemporaries Abû Nàṣr or al-Khojendî (al-Chodschendî), the tenth century of our era. The cosine theorem was implied rules known to the early Indians, but was exhibited more fully b Regiomontanus (*c.* 1460), and ultimately by Tycho Brahe (b fore 1590). Gauss's formulae of 1809 were found earlier b Delambre (1807) and Mollweide (1808). Napier's analogie curiously enough, arrived much earlier, 1619, in Napier's wor and were practically exhibited by Briggs in 1620.

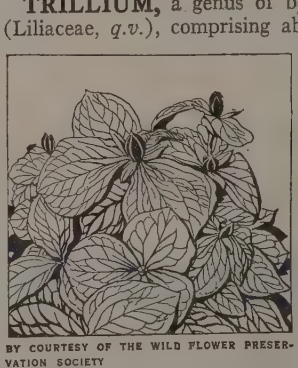
TRIKKALA (anc. *Trika*), a town of Thessaly, capital of t department of Trikkala, and the see of an archbishop, 38 m. W of Larissa. In winter, when great numbers of Vlach herdsm settle in the town, its population exceeds that of Larissa. It h the appearance of a Mussulman town on account of its mosqu (only two of which are in use) and is a centre of trade in whea maize, tobacco and cocoons. In ancient times it was a seat the worship of Aesculapius. Pop. (1923) 24,005, of the depar ment, 198,319.

TRILLIUM, a genus of beautiful plants of the lily fami (Liliaceae, *q.v.*), comprising about 30 species, natives of Nor America and eastern Asia. Th are smooth low perennials, wi a simple stem bearing at the t a whorl of three leaves and single conspicuous flower. The are three green sepals, thr showy petals, six stamens and three-celled ovary; the fruit is many-seeded berry. Some species occur in the United Stat and Canada; these include ma handsome spring wild flowe known as wake-robin and birt root. Well-known eastern speci are the large flowered wake-rob (*T. grandiflorum*), the ill-scent wake-robin (*T. erectum*), t painted wake-robin (*T. undul tum*) and the mountain wake-robin (*T. stylosum*).



BY COURTESY OF THE WILD FLOWER PRESERVATION SOCIETY

TRILLIUM OR WAKE ROBIN (TRILLIUM SESSILE), ONE OF THE LILY FAMILY HAVING BROWNISH PURPLE FLOWERS

TRILOBITA, a group of extinct Arthropoda of which t fossil remains are found in the rocks of the Palaeozoic era. Ma species are found in the Lower Cambrian, among the earlie known fossils. They are abundant in the Ordovician and Silur when they begin to decline and only a single genus survives in t Permian.

A typical trilobite has a segmented body roughly resembli that of a wood-louse, with the dorsal surface marked by two long tudinal furrows which divide it into the three lobes alluded to the name of the group. In the head-region the middle lobe is t glabella and usually shows transverse grooves marking the fi segments of which the head is composed. On either side of t head are plates, the "free cheeks," divided from the central pa of the head by the "facial sutures" and bearing the compou eyes. In some trilobites, however, the eyes are reduced or abse Behind the head a number of the body-segments, from two to 2 are freely movable, and they are followed by a tail-shield or "p gidium" which often shows, by transverse furrows, that it is co posed of a number, sometimes a large number, of segments. So

bites, such as *Calymmene*, could roll up into a ball like many
l-lice and are often found in this condition.
or long no definite traces of the limbs of trilobites could be
vered and their nature was the subject of much speculation.
have now been described in several genera by C. D. Walcott,
. Beecher and P. D. Raymond. The structure is most fully
n in *Triarthrus*, investigated by Beecher and by Raymond.
appendages of the first pair, placed at the sides of the fore-
hypostoma) which underhangs the mouth, are long, slender,
-jointed antennae. The remaining appendages are all similar
ructure and are attached, four pairs to the head and one pair
to the somites of the body whether free or coalesced into the
lium. They are two-branched, the inner branch (endopodite)
a jointed leg, while the outer (exopodite) bears a fringe of
seem to be stiff flattened bristles. The two branches spring
a single basal segment drawn out on the inner side as a jaw-
(gnathobase) which served, no doubt, to seize food and pass
rward to the mouth. Towards the hinder end of the body
appendages become smaller and the inner edge of the endo-
te is lobed in a way recalling the appendages of the Branchio-
Crustacea. In *Neolenus* another point of resemblance to
ain Branchiopoda is provided by a pair of long thread-like tail-
ents. Walcott believed the structure of the limbs to be more
plex, certain genera possessing, in addition to the parts men-
ed, two or three "epipodites," but the presence of these awaits
irmation. Still less probable is Walcott's conclusion that
mmene and *Cerarurus* possessed corkscrew-like gills.
he development of various species has been traced. Starting
a minute larva with only indications of head and pygidium,
ents appear between these regions in order from behind for-
ls, the new segments being set free in succession from the
t edge of the pygidium. The relationships of trilobites to the
ous groups of Arthropoda now living have been the subject
uch discussion but the elucidation of their appendages leaves
loubt that their main affinities are with the Crustacea (*q.v.*).
five pairs of appendages on the head-region are directly com-
ble with those of Crustacea, since the second pair or antennae
rustacea are still postoral and biramous and carry a mastica-
process or gnathobase in the nauplius larva as in the trilobites.
biramous form of all the postoral limbs is also a weighty argu-
t in favour of crustacean affinity. On the other hand, there is
race of the characteristic crustacean shell-fold or carapace. In
uniformity of the postoral appendages, however, the trilobites
more primitive than any living crustacean. The view that
bites are phylogenetically connected with Arachnida (*q.v.*)
less to support it, but it is possible that connecting links may
be proved to exist in the imperfectly known Cambrian *Limu-*
of Walcott.
he trilobites were all marine and lived, some on sandy or
dy bottoms, some on coral reefs, and some, perhaps, in the
sea. They were distributed all over the world and in some
ities were in such abundance that rock strata are crowded with
remains. A very large number of genera and species are
wn. Their range of size is from a quarter of an inch to 20in.
ength, but most species are between one and three inches
(W. T. C.)

RIM, a market town and the county town of Co. Meath,
nd, on the upper waters of the Boyne, 30 m. N.W. by W.
Dublin on a branch of the Great Southern railway. Pop.
1) 2,786. Monthly fairs are held, and there is considerable
e in corn and flour. The town was the seat of a very early
opric. A Norman tower, called the Yellow Steeple, is sup-
d to mark the site of St. Patrick's Abbey of St. Mary. Two
s remain from the old town walls. King John's castle was
nally founded by Hugh de Lacy in 1173, but a later date is
gnable to the greater part of the building. Other castles are
ot's and Scurlogstown castles; the former erected by Sir John
ot, lord lieutenant of Ireland in 1415, the latter dating from
. About a mile east of the town, the ruins of the abbey of
Peter and St. Paul occupy both banks of the river. These in-
e the Transitional-Norman cathedral on the north bank, and
stle, guarding the crossing of the river, on the south, together
with a chapel and other remains. North of the town ruins may be seen of a 13th century Dominican friary. The tower of the old parish church dates from 1449. Several Irish parliaments met at the castle until the middle of the 15th century, and a mint was established in 1469. The town was incorporated by Edward III.

TRIMONTIUM, according to Ptolemy (ii. 3, 6) a "city" in the territory of the Selgovae, was probably the name of the Roman fort at Newstead, near Melrose, Scotland, close under the three Eildon Hills (whence the name *trium montium*). It was an advanced post of the Romans towards Scotland from about A.D. 80 onwards, and again (after an interval of evacuation) from about A.D. 140–180. Excavations carried out between 1907 and 1911 yielded finds of almost unique importance. These included the foundations of several successive forts, one above the other, which throw much light on the character of the Roman military post, an unparalleled collection of Roman armour, notably ornate helmets, and a good series of coins and datable pottery. The whole illustrate the history of the Roman army and that of Roman Scotland very remarkably and to an extent equalled by no other Scottish site as yet explored.

See James Curle, *A Roman Frontier Post and its People* (Glasgow, 1911).

TRINCOMALEE, a town and former naval station on the north-east coast of Ceylon, 100 m. N.E. by N. of Kandy. Pop. (1921) 34,112. It is built on the north side of the bay of Trincomalee, on the neck of a bold peninsula separating the inner from the outer harbour. The annual average rainfall is 62·75 inches and the average temperature 81·2° F.

The town was one of the first Tamil settlements in Ceylon. Their temple, dedicated to Konatha, or Konasir, on a height at the extremity of the peninsula, was known as the "temple of a thousand columns." The building was destroyed in 1622 by the Portuguese. The town was successively held by the Dutch (1639), the French (1673), the Dutch (1674), the French (1782), and the Dutch (1783). It surrendered to the British fleet in 1795, and with other Dutch possessions in Ceylon was ceded to Great Britain by the Treaty of Amiens in 1802.

With its magnificent harbour—one of the five or six greatest natural harbours in the world—it used to be the headquarters of the admiral commanding on the East Indian station and had a military garrison. Pearl oysters are found in the lagoon of Tambalagam to the west of the bay. Some tobacco, rice, and palm are grown in the district.

Rice and general merchandise are imported while paddy, timber, dried fish, tobacco, deer horns and skins are exported. The merchant anchorage in the harbour is in 4 to 8 fathoms about 4 cable lengths from the wharf. The harbour can accommodate the largest vessels.

TRING, a town in Hertfordshire, England, 31½ m. N.W. of London on the L.M.S. railway. Pop. (1921) 4,345. It lies on the western slope of the Chiltern hills, close to the entrance to a narrow valley which pierces them, and forms one of the highways through them to London. It has small straw-plaiting and other industries. The Rothschild museum contains an extensive natural history collection. The road which passes through Tring follows the ancient Icknield Way, and there may have been a Romano-British village on the site of the present town.

TRINIDAD, a town near the southern coast of Cuba, in Santa Clara province, about 45 m. south-east of Cienfuegos, and 3 m. from its seaport, Casilda, which lies due south. Pop. (1925) 45,930. There is a local railway, connected with the central trunk line of the island. The city lies on the slope of La Vigia hill (900 ft.) amid higher mountains, and on the banks of the Jayoba (San Juan) river. Casilda has a land-locked, shallow harbour; but Masio bay, a trifle farther distant, accommodates larger craft; and there are excellent deep-water anchorages among the quays off the coast. The Manatí river is navigable for about 7 m. inland and is used as an outlet for sugar and molasses crops. These and honey are the chief exports; tobacco and various vegetables and fruits are of minor importance. Trinidad is one of the seven original cities of Cuba established by Diego Velásquez. It was founded in 1514 on the coast, but after being attacked by pirates

was removed inland. It was thrice sacked by English buccaneers—in 1642, 1654 and 1702; and in the following years, up to and for a time after the peace of Utrecht (1713), it maintained ships and soldiers. Indeed, throughout the first half of the 18th century it was on a continuous war footing against English corsairs, making reprisals on British ships and thriving at the same time on a large contraband trade with Jamaica and other foreign colonies.

TRINIDAD, a city of southern Colorado, U.S.A., on Purgatory river, at an altitude of 5,963 ft., 10 m. from the New Mexico line; the county seat of Las Animas county. It is on Federal highways 85 and 350, and is served by the Colorado Southern, the Colorado and Wyoming, the Denver and Rio Grande Western and the Santa Fé railways. The population was 10,906 in 1920 (87% native white). It is in the midst of beautiful mountain scenery and picturesque canyons, with Fisher's peak (9,586 ft.), the highest in the Raton range, 5 m. to the south. The city is a shipping point for cattle and wool, and for the large quantities of coal (3,500,000 tons annually) mined in the vicinity. It has coking ovens and various other manufacturing industries. Trinidad was incorporated as a town in 1876 and as a city in 1879. In the early days it was a frequent resort of the scout "Kit" Carson.

TRINIDAD, the most southerly and, next to Jamaica, the largest of the British West Indian islands. Pop. (1925) including Tobago, 385,091. It is situated 6m. E. of the coast of Venezuela, between 10° 3′ and 10° 50′ N. and 60° 39′ and 62° W. Average length, 48m.; breadth, 35m.; area 1,754 sq. miles. In shape it is almost square, with promontories westward from its north and south corners, enclosing the Gulf of Paria. To the west of the northern spur lie several islands, of which Chacachacare, Huevos Monos and Monos Gaspar Grande are the most important. The surface is undulating or level, except in the north and south, where there are ranges of hills running east and west, prolongations of the Venezuelan coast ranges. Of these the northern is the more elevated, its highest point being Tucuche Peak (3,100ft.). The southern hills attain 600ft. A small ridge runs east to west by south, through the centre of the island, from Manzanilla Point to San Fernando, with the isolated Mt. Tamana (1,028). The hills of the northern and southern ranges, furrowed by innumerable ravines, are densely wooded.

In its geology, as well as in its flora and fauna, Trinidad differs little from the mainland, with which it was doubtless at one time connected. There are four mineral springs and several mud volcanoes, but the two most striking natural features are the Maracas falls, and the Pitch lake. The Maracas falls, 312ft. high, are situated at the head of a valley of the same name, to the north-east of Port of Spain. The Pitch lake lies some 38m. S.E. of the capital, by water, in the ward of La Brea. It is circular in form, about 3m. in circumference, and 104ac. in extent. The asphalt wells up in low bulging masses, separated from one another by narrow channels, in which the rain forms pools. Near the centre of the lake the pitch is always liquid and can be observed bubbling up. When the sun is hot the lightest footfall leaves an impression, and the pitch emits a strong odour. The soil of the surrounding district is charged with asphalt, but is very fertile, while the road to the neighbouring port of La Brea, running over a bed of asphalt, moves slowly towards the sea like a glacier. The lake is worked by a company which exports the asphalt to the United States, paying royalty to the local Government.

The mountain range which runs along the north coast is formed of clay-slates, micaceous and talcose schists, and crystalline and compact limestones, constituting the group of unknown age called the Caribbean series. The rest of the island is composed of Cretaceous, Tertiary and Quaternary strata. The Cretaceous beds rise to the surface in the centre and are flanked to north and south by later deposits. The relations of the various divisions of the Tertiary formation are still somewhat obscure; but they are grouped by J. B. Harrison into (1) Nariva and San Fernando beds = Eocene and Oligocene; (2) Naparima marls = Miocene and (3) Moruga series = Pliocene and Pleistocene. The Naparima marls consist of a lower division containing *Globigerina* and an upper division with Radiolaria and diatoms and are clearly of deep-sea origin. The bitumen of the Pliocene and Pleistocene deposits appears to have been formed by the decomposition of vegetable matter. Salses or mud volcanoes occur upon the island

The presence of oil under Trinidad had been suspected for many years, and early in the 20th century the Government under took a geological survey. This survey revealed the presence of series of anticlines at payable depths in the southern division of the island, and experimental borings by three companies, at I

A HINDU TEMPLE IN TRINIDAD, SHOWING SEVERAL PRIESTS ON THE STEP

Brea and Point Fortin in the south-west, and Guayaguayare in the south-east, proved the presence of oil in large quantities. considerable oil field has been located which has only in pa as yet been tapped, but a flourishing industry has already be established, the exports in 1928 being 5,200,000 barrels of and benzol, much of it refined locally.

The soil of the island is very rich, and well adapted to t growth of tropical products, especially of sugar and cocoa, wh are its staples. Planting of new lands is rapidly progressing, t greater part of the unsold Crown lands (various blocks of wh have been formed into forest or water reserves) containing valuable supply of timber. Owing to the variety of its resourc Trinidad has suffered less from economic depression than t other islands in the British West Indies. It exports cocoa, sug rum, molasses, coffee, coco-nuts, Angostura bitters, timber, inc rubber and asphalt. Large quantities of tonga-beans, the prod of the mainland, are cured in bond at Port of Spain. The manuf ture of bitters (Angostura and others) is an important indust as is also the raising of stock. In addition Trinidad has a la carrying trade with the neighbouring republics, and rivals Thomas (*q.v.*) as a centre of distribution for British and Am ican merchandise through the West Indies and Venezuela. Trini is immune from hurricanes and its seasons are regular, wet fr May to January, with a short dry season in October known the Indian summer and lasting usually about four weeks, a dry from end of January to middle of May. The average ann rainfall is 63·22in. and the mean temperature is 80°F. Of inhabitants of the island, one-third are East Indians. Of the r the upper classes are creoles of British, French and Spanish blo while the lower classes are of negro or mixed negro origin, wit few Chinese. English is spoken in the towns and in some of country districts, but in the north and generally in the coc growing areas, a French *patois* prevails, and in several distr Spanish is still in use. Elementary education is given chiefly the State-aided schools of the different denominations, but th are a number of entirely secular schools managed by the Gove ment. Presbyterian schools are conducted by a Canadian missi Agriculture is a compulsory subject in all the primary scho Higher education is provided by the Queen's Royal college secular institution, to which the Presbyterian Naparima coll and the Roman Catholic St. Mary's college are affiliated. Attac to these colleges are four scholarships of the annual value of £ for four years, tenable at any British university. The Rom Catholics (with an archbishop at Port of Spain) and the Anglica with the bishop of Trinidad at their head, are the most numer

ious communities. English money is legal tender, also the ed States gold currency. Accounts are kept in dollars by the ral public, but in sterling by the Government. The public nue of the colony in 1926 was £1,737,288, expenditure £1,580,- public debt £3,342,000, total imports £4,827,923 (£1,321,109 the British empire, £1,181,378 from the United States), rts about £6,000,000; to the British empire, £2,644,367, to ed States £1,800,500. There is a large transit trade, Trinidad a convenient entrepôt. A complete system of main and roads is constructed or under construction; there are about of railways, and most of the larger towns can be reached Port of Spain by rail. Steamers ply daily between Port of n and the islands at the northern entrance to the Gulf of Paria, between San Fernando (the southern terminus of the rail-) and the south-western ports of the island. There is a weekly tal service which calls at Tobago. A number of British and pean steamship lines visit Port of Spain.

he colony (Trinidad and Tobago) is administered by a gov-r, assisted by an executive council and a legislative council o members, of whom ten are officials sitting by virtue of e and ten are unofficials nominated by the Crown. Port of n, the capital, is situated on the west coast on the shores of Gulf of Paria. It is considered one of the finest towns in the t Indies, with shaded streets, abundant water supply, and excellent service of tramways. It has two cathedrals, a fine k of public buildings containing the principal Government artments, the courts of justice and the legislative council nber, other large Government buildings, a public library, and y good shops. In its botanical garden the residence of the rnor is situated. The harbour is an open roadstead, safe and tered, but so shallow that large ships have to lie at anchor a mile from the jetties. It is, nevertheless, the place of ship-t for the produce of the entire island, and also for that of the oco region. The population is about 61,530. It has a mayor corporation. Other towns are San Fernando, also on the Gulf Paria, about 30m. S. of the capital; and Arima, an inland town . by rail E. of Port of Spain.

rinidad was discovered by Columbus in 1496. It remained in nish possession (although its then capital, San José de Oruna, burned by Sir Walter Raleigh in 1595) until taken by the ish in 1797. It was finally ceded to Great Britain by the aty of Amiens in 1802.

n 1921 the Imperial College of Tropical Agriculture was blished in Trinidad, at St. Augustine, about 7m. from Port Spain. Its purposes are to provide training in the science and ctice of tropical agriculture for students intending to become ical planters, agricultural administrators or specialists in agri-ural science and technology. It is equipped with free laborato- and experimental fields. The site was provided by the colony, £50,000 was subscribed locally towards the cost of the build- Maintenance is provided for by imperial grants and con-utions from West Indian and West African Governments. ish sugar machinery firms contributed £20,000 towards the of the instructional sugar factory.

RINIDAD, an uninhabited island in the South Atlantic, m. E. of the coast of Espirito Santo, Brazil, in 20° 30′ S. 20′ W., 4 m. long by 2 broad.

RINITARIANS, a religious order founded in 1198 by St. n of Matha and St. Felix of Valois, for the liberation of Chris- prisoners and slaves from captivity under the Moors and acens. The two founders went to Rome and there obtained approbation of Innocent III., 1198. The rule was the Augus-an, supplemented by regulations of an austere character. The it was white, with a red and blue cross on the breast. The nitarians are canons regular, but in England they were often ken of as friars. The first to go on the special mission of the order were two Englishmen, who in 1200 went to Morocco and returned thence to France with 186 liberated Christian captives. Vast sums of money were collected by the Trinitarians; but they were called upon, if other means failed, to offer themselves in exchange for Christian captives. Many thousands were liberated by their efforts. In the 17th century a reform called the Barefooted Trinitarians was initiated, which became a distinct order and is the only one that survives. There are now less than 500 members. Their headquarters are at San Crisogono in Rome. They devote themselves to the ransoming of negro slaves, especially children, and a great district in Somaliland has been since 1904 entrusted to them as a field for missionary work.

BIBLIOGRAPHY.—The chief modern book on the Trinitarians is Deslandres, *L'Ordre français des Trinitaires* (2 vols., 1903). Sufficient information will be found in Max Heimbucher, *Orden u. Kongregationen* (1907), ii. §57; and in the *Catholic Encyclopaedia*, article "Trinitarians."

TRINITY. The Christian doctrine of the Trinity can be best expressed in the words "The Father is God, the Son is God, and the Holy Ghost is God, and yet they are not three Gods but one God . . . for like as we are compelled by the Christian verity to acknowledge every Person by himself (*singillatim*) to be God and Lord, so we are forbidden by the Catholic religion to say that there be three Gods or three Lords" (*Quicunque vult*). Though this doctrine was one of the first to be dealt with by modern methods of "comparative religion" (as long ago as when Gibbon wrote, "300 B.C., The Logos taught in Alexandria, A.D. 97. Revealed by St. John")—and though it is natural to ask its relation to certain triple arrangements of Pagan deities, to Jewish doctrines of "Wisdom" and the "Word," to the Hegelian triad "The Idea: Nature: Spirit"—it is probably less well adapted to this treatment than other Christian doctrines. At any rate the first step is to discover what, in using this *prima facie* paradoxical language, the Christian Church believed itself to be asserting.

Here a common misunderstanding must be cleared away. "The Creed"—it has been suggested (see *Hibbert Journal*, xxiv. No. 1)—"means that there is only one being that can, with strict theological correctness, be called 'God,' viz., the Trinity as a whole; but each of the three persons can be called 'God' in a looser sense." This suggestion is offered as a short method of "rendering consistent" the statements of the Creed. But the paradox is not thus lightly to be got rid of. Plainly the Church did not regard itself as lowering the conception of the Father, so that He should become merely one Component of a Divine Whole. "The Father," says St. Thomas Aquinas, "is as great as the whole Trinity," and explains that in such matters "greatness signifies perfection of nature and pertains to essence" (*Summa Theol.* i., xxx. 1, xlii. 4).

Fundamental Conceptions.—This conception of the Trinity is systematically developed by theologians, Greek, Latin and Protestant. "The whole perfection of the Divine nature is in each of the persons. The essence and dignity of the Father and the Son is the same, but is in the Father according to the relation of Giver, in the Son according to the relation of Receiver" (*S.T.* i., xlii. 4). Writers in the 4th and 5th centuries had compared the relation of the Father to the Son with the relation of the "flame to its light," of the "spring to the stream," of the "seal" to its "impress." "Think," says St. Augustine (*Sermo ad Catechumenos*, sec. 8) "of fire as a father, light as a son. See: we have found coevals: and it is easy to see which begets which." The meaning of these comparisons is plain. They teach that the whole Divine nature or essence is in each of the Three Persons. The impress, for example, is a *full* reproduction of the character of the seal. They teach also that the Divine persons are inseparable. We are dealing both with a "generical" and a "numerical" unity (*cf.* Aug., *F. and S.*, sec. 4; *Modern Churchman*, vol. xv. 12, 675–7; Webb, *God and Personality*, 69n).

Thus, side by side with language declaring that Father and Son are each in the full sense God, there is other language—not *intended* to be inconsistent with the former—which implies that the Son is "necessary to the completeness of the Godhead." The Son, we are told, is not "external" to the Father (Athan., *Discourse I.*, ch. v.), does not "accrue" to the Father from without, but is "of the Substance of the Father." If the Son, it is argued,

were not eternal, the Father would not always be Father, and this absence of fatherhood, it is implied, would be a defect (*cf.* the words *consortium, solitarius, S.T.* i., xxxi., 2 and 3). What is the value of these speculations? They cannot be understood apart from a knowledge of the context in which they grew up. This context may be summed up in a sentence. Christians, who were willing to die for Monotheism, deliberately held Jesus to be worthy of full Divine worship; and offered the phrase *Consubstantialem patri* as the intellectual justification of this attitude. In contact with the "Spirit" (who was held to speak in the heart of the individual Christian) they believed themselves to be in contact with God. In contact with Jesus as Master, they likewise found themselves in contact with God; but with no divided allegiance, since they conceived the Universe—in spite of its manifest evils—as the work of the Father of Jesus Christ, and so the embodiment of the same Holy Will which expressed itself most clearly in Jesus and in the Holy Spirit.

The doctrine, then, is primarily religious; and if we define God—as in practice religion does—as "That which has an absolute claim upon our obedience" or as "the Supreme Object of our reverence," the paradoxical element in the doctrine is at least diminished. The ultimate Object of the Christian's reverence is—as reflection will show—the Christian ideal of holiness. A being who fell short of this standard, however omnipotent or self-existent he might be, would not receive the Christian's worship. Conversely, this standard would have an equal claim upon our reverence—since its claim to our obedience is conceived as being absolute—whether or not it were embodied in a person. Jesus is worshipped because the Christian "identifies" Him with His Call—His Law. Reverence and subjection to Him are reverence and subjection to it (John xiv. 21, etc.). Is there, then, any insuperable difficulty in the notion of a threefold personal embodiment of the one Divine Will and Character, an embodiment so complete in each case that contact with the Divine Person is contact with God?

Claims of Unity.—The answer to the foregoing question turns upon the claims of unity. The unity of the world is sometimes represented as based upon its presence to, and its existence in, a single Divine Mind. Religion, however, is interested primarily in the unity of the moral ideal, of the ideal of perfection generally. "The Monotheism of Israel," it has been well said, "was primarily moral seriousness." Religion is concerned also with a faith—which is the basis of its trust and hope—in the necessity of the complete realization of the good in the universe as seen in God; with a faith in that "perfection of the Universe" which St. Thomas regarded as God's chief purpose in creation (i. 50, 3). A Universe which has unity as the complete realization of this single ideal, has the unity which chiefly concerns religion. This ultimate unity of subordination to a single principle is not necessarily identical with the unity which comes from being included within the mind of a single Divine Being. Nor is it obviously identical with the theologian's "numerical unity of substance" (*see e.g.*, Tanqueray, *Syn. Theol. Dog.*, ii. 575–576). The Unity, then, of the Object of our supreme reverence and trust is not plainly inconsistent with the existence of personal distinctions (in the modern sense of the word) within the Godhead. It was probably an afterthought to regard the doctrine of the Trinity as providing a more satisfactory conception of "personality in God" than could grow up under a "unipersonal" theology. Yet Trinitarianism has some points of superiority over a theory which may compel us to conceive God as waking up at the Creation from "an eternity of idleness" (Shelley, *Queen Mab*, vii. *cf. Journal of Theol. Studies*, iv. 376). Love—it may be argued—can only be at its highest perfection in the "love of God for God"—in a love in which He that loves and He that is loved are wholly adequate to one another. A faith in God's perfection would thus tend to a belief in the "plurality of persons in the Godhead."

Amplifying Conceptions.—It has been similarly argued that in conceiving the "not-self with which God contrasts Himself" as "wholly internal to His essence" while the unity (the Holy Spirit) "within which the relation of the two falls is not, as in us, a dark mystery at the back of our life but something which 'proceeds from both'" we have "the best notion that we can frame of Being at its highest" (Webb, *J.T.S.*, Oct. 1900). Such an arg ment leads not merely to a plurality but to a trinity of Divi persons, and supports the Western doctrine of the procession the Spirit from the Father and the Son, *tanquam ab uno princip et unica spiratione* (Council of 1274). It agrees also with the co ception of the mutual indwelling of the Three Persons (Tanquera *S.T.D.*, ii., 664–665). Again, the argument—if joined with t belief that "whatever we conceive the Divine life to be, our li cannot be outside it"—is in accordance with the Scriptural co ception that mankind is within the Eternal Son, that the Chur is His "body" or His "fulness." Such a conception would le us beyond any mere "trinity of manifestation"; since it impli that, though in knowing each Person of the Trinity we are kno ing God, yet to know God as Trinity is a real addition to o knowledge, and further, that the personal relations within t Trinity are necessary to His full glory, since they make possib to God something better than mere self-contemplation.

The doctrine, then, we may conclude, arose primarily from t conviction that worship of Jesus is consistent with Monotheis But if, secondarily, the doctrine when formed is defended offering the best attainable conception of the Divine perfectio it follows that our sense of what is good and fitting, our aesthe and religious instinct for perfection, and likewise those qualit in the doctrine which moved Dante (*Parad.*, x. 1–6) to give poetic expression, are all relevant to its discussion. (*See* PANTH ISM, ATHEISM.) (C. J. SH.)

TRINITY HOUSE, CORPORATION OF. An assoc tion of English mariners which originally had its headquarters Deptford in Kent. In its first charter, received from Henry VI in 1514, it was described as the "guild or fraternity of the m glorious and undividable Trinity of St. Clement." The first mas appointed was the founder of the corporation, Sir Thomas Spe comptroller of the navy to the king, and commander of t "Harry Grace de Dieu." Deptford having been made a roy dockyard by Henry VIII., and being the station where outgoi ships were supplied with pilots, the corporation rapidly develop its influence and usefulness. By Henry VIII. it was entrust with the direction of the new naval dockyard. From Elizabe who conferred on it a grant of arms in 1573, it received auth ity to erect beacons and other marks for the guidance of navig tors along the coasts of England. In 1604 a select class, w constituted called Elder Brethren, the other members being cal Younger Brethren. By the charter of 1609 the sole manageme of affairs was conferred on the Elder Brethren; the Young Brethren, however, having a vote in the election of master a wardens. The practical duties of the fraternity are discharged the acting Elder Brethren, 13 in number, of whom two a elected from the royal navy and 11 from the merchant servi but as a mark of honour persons of rank and eminence are a mitted as honorary Elder Brethren. In 1647 the corporation w dissolved by parliament, but it was reconstructed in 1660, and t charter was renewed by James II. in 1685. In 1687 a by-law the Trinity House for the first time required an agreement writing between the master and crew of a ship. A new hall a almshouses were erected at Deptford in 1765; but for some ti the offices of the corporation had been transferred to Lond where for a while they had a house in Water lane, Lower Tham street, and in 1795 their headquarters were removed to Trin House, Tower hill, built from the designs of Samuel Wyatt. an Act of 1836 they received powers to purchase from t

n, as well as from private proprietors, all interests in coast . For the maintenance of lights, buoys, etc., they had power ise money by tolls, the surplus being devoted to the relief il and indigent mariners or their near relatives. In 1853 the ol of the funds collected by the corporation was transferred e Board of Trade, and the money over which the brethren allowed independent control was ultimately reduced to the te income derived from funded and trust property. Their ical duties in erection and maintenance of lighthouses, s and beacons remain as important as ever. Similar func- are carried out by the Northern Lighthouse board and the Lighthouse board, for Scotland and Ireland respectively. have also the care and supervision of pilots. Other Trinity es established under charter or act of parliament for the intment and control of pilots are at Hull and Newcastle. Elder Brethren of Trinity Masters also act as nautical as- rs in the high court of Admiralty. The corporation has a wharf and repair shop at the mouth of the river Lea, where of the work of buoying the Thames is carried out.

W. H. Mayo, *Trinity House, London, Past and Present* (1905); B. Barrett, *The Trinity House of Deptford Strond* (1893).

RINITY SUNDAY, the Sunday next after Whitsunday. A val in honour of the Trinity had been celebrated locally at ous dates for many centuries before Pope John XXII. (1316–) ordered its general observance on the octave of Whitsun- From Trinity Sunday onwards all Sundays until the close ie ecclesiastical year are reckoned in the Church of England after Trinity," in the Roman Church as "after Pentecost."

RINOVANTES, commonly *Trinobantes,* a powerful British about 50 B.C–A.D. 50 dwelling north and north-east of Lon- rivals and neighbours of the Catuvellauni. When Caesar in- d Britain 54 B.C. they joined him against their domestic rivals. were conquered by Rome in A.D. 43 and joined in Boadicea's lt in 61. In the tribal division of Roman Britain given by emy their land included Camulodunum (Colchester), but ing more is known of them. But their name plays a part in iaeval legends and romances. There it was interpreted as Troy ant, the "new Troy," and connected with the names of the ans Brutus and Corineus who were reputed to have given their es to Britain and Cornwall. (F. J. H.)

RIOLET, one of the fixed forms of verse invented in iaeval France, and preserved in the practice of many modern atures. It consists of eight short lines on two rhymes, ar- ed a b a a a b a b, and in French usually begins on the mas- ie rhyme. The first line reappears as the fourth line, and the nth and eighth lines repeat the opening couplet; the first therefore, is repeated three times, and hence the name. more typical specimen of the triolet could be found than following, by Jacques Ranchin (*c.* 1690):—

"Le premier jour du mois de mai
Fut le plus heureux de ma vie:
Le beau dessein que je formais,
Le premier jour du mois de mai!
Je vous vis et je vous aimais.
Si ce dessein vous plut, Sylvie,
Le premier jour du mois de mai
Fut le plus heureux de ma vie."

poem was styled by Ménage "the king of triolets." The t art of the triolet consists in using the refrain-line with naturalness and ease that it should seem inevitable, and in each repetition slightly altering its meaning, or at least elation to the rest of the poem. The triolet seems to have invented in the 13th century. The earliest example known rs in the *Cléomadés* of Adenès-le-Roi (1258–97). The medi- l triolet was usually written in lines of ten syllables, and the tness of touch in the modern specimens was unknown to these ectly serious examples. One of the best-known is that of issart, "Mon coeur s'ebât en odorant la rose." According to asin, who introduces the triolet as a mourner in his *Pompe ère de Voiture,* it was that writer who "remit en vogue" ancient precise forms of verse, "par ses balades, ses triolets es rondeaux, qui par sa mort (1648) retournaient dans leur ancien décri." Boileau threw scorn upon the delicate art of these pieces, but they continued to be written in France, though not by poets of much pretension, until the middle of the 19th century, when there was a great revival of their use. There are delightful examples by Theodore de Banville.

The earliest triolets in English are those of a devotional nature composed in 1651 by Patrick Carey, a Benedictine monk at Douai, where he probably had become acquainted with what Voiture had made a fashionable French pastime. In modern times, the triolet was re-introduced into English by Robert Bridges, in 1873, with his—

"When first we met, we did not guess
That Love would prove so hard a master;
Of more than common friendliness
When first we met we did not guess.
Who could foretell this sore distress,
This irretrievable disaster,
When first we met?—we did not guess
That Love would prove so hard to master."

Since then the triolet has been cultivated very widely in English, most successfully by Austin Dobson, whose "Rose kissed me to-day," "I intended an Ode" and "In the School of Coquettes" are masterpieces of ingenuity and easy grace.

TRIPHENYLMETHANE, a hydrocarbon, $(C_6H_5)_3CH$, which gives its name to an important group of synthetic colouring matters which includes magenta, paramagenta (rosanilines), malachite green, brilliant green, patent blue, aurin and rosolic acid. (*See* DYES, SYNTHETIC.) It is a white crystalline solid melting at 92° C and boiling at 358° C/760 mm. Its preparation is best effected by adding anhydrous aluminium chloride to a mixture of dry benzene and dry carbontetrachloride; after 24 hours anhydrous ether is slowly added and the mixture then treated with acidified ice water. The hydrocarbon is extracted with benzene and obtained from this extract by a distillation under reduced pressure, being purified by crystallisation from ethyl alcohol (O. Kamm and J. F. Norris, *Organic Syntheses,* Vol. iv., J. Riley and Sons, 1925). Other modes of formation are as follows: (1) Condensation of benzal (benzylidene) chloride, $C_6H_5{\cdot}CHCl_2$, with mercury diphenyl; (2) condensation of benzene with chloroform in presence of aluminium chloride; (3) from paramagenta (pararosaniline chloride) by successive reduction, diazotisation and replacement of diazo-groups by hydrogen. The third process is of historical interest as it served to establish the connection between the hydrocarbon and the rosaniline colouring matters (O. and E. Fischer, 1881). Conversely, triphenylmethane can be nitrated and its trinitro-compound can be reduced to paraleucaniline, $CH(C_6H_4{\cdot}NH_2)_3$, which on oxidation in acid solution yields pararosaniline chloride or paramagenta, $(NH_2{\cdot}C_6H_4)_2C{:}C_6H_4{:}NH_2Cl$. Triphenylmethane on oxidation is found to give triphenylcarbinol, $(C_6H_5)_3C{\cdot}OH$, a feebly basic hydroxide which on treatment with hydrogen chloride is converted into colourless triphenylmethyl chloride, $(C_6H_5)_3C{\cdot}Cl$, melting at 111° C. This chloride is the primary product of the foregoing condensation of benzene and carbon tetrachloride (*v. supra*).

By the action of various metals (zinc, silver, copper or mercury) on triphenylmethyl chloride, M. Gomberg in the year 1900 isolated a very remarkable unsaturated hydrocarbon, triphenylmethyl, $(C_6H_5)_3C$, and he showed that the reaction was general by removing chlorine from other triarylmethyl chlorides.

Triphenylmethyl is colourless in the solid state but yields yellow solutions. Cryoscopic determinations show that the dissolved hydrocarbon is chiefly in the bimolecular state,

$$(C_6H_5)_3C{\cdot}C(C_6H_5)_3,$$

which is in equilibrium with the coloured unimolecular form. With increasing complexity of the aryl groups there is a greater tendency for the triarylmethyls to exist in the unimolecular condition, so that the successive replacement of phenyl by diphenyl is accompanied by an increase in depth of colour until trisdiphenylmethyl, $(C_6H_5{\cdot}C_6H_4)_3C$, which occurs only in the coloured unimolecular condition, is obtained as a green crystalline powder melting at 186° C (W. Schlenk, T. Weickel and A. Herzenstein, 1910). On the other hand diphenyldiphenylenemethyl,

$(C_6H_5{\cdot}C_6H_4{\cdot}C{:}C_{12}H_8)_2$,

exists only in the colourless bimolecular condition. (*See* J. Schmidlin, *Das Triphenylmethyl*, F. Enke, 1914.) (G. T. M.)

TRIPOD, in classical antiquities, any "three-footed" utensil or article of furniture. The name is specially applied to: (1) a seat or table with three legs; (2) a stand for holding the caldron used for boiling water or cooking meat; (3) a sacrificial tripod or altar, the most famous of which was the Delphic tripod, on which the Pythian priestess took her seat to deliver the oracles of the god, the seat being formed by a circular slab on the top, on which a branch of laurel was deposited when it was unoccupied by the priestess. Another well-known tripod was the "Plataean," made from a tenth part of the spoils taken from the Persian army after the battle of Plataea. This consisted of a golden basin, supported by a bronze serpent with three heads (or three serpents intertwined), with a list of the States that had taken part in the war inscribed on the coils of the serpent. The golden bowl was carried off by the Phocians during the Sacred War; the stand was removed by the emperor Constantine to Constantinople, where it is still to be seen in the Atmeidan (hippodrome), but in a damaged condition, the heads of the serpents having disappeared. Tripods are frequently mentioned in Homer as prizes in athletic games and as complimentary gifts, and in later times, highly decorated and bearing inscriptions, they served the same purpose.

ROMAN BRONZE TRIPOD IN MUSEUM AT NAPLES

TRIPOLI, the ancient *Oea,* formerly capital of the Turkish vilayet of Tripoli, and now of the Italian colony of Tripolitania, North Africa, situated in 32° 53′ 40″ N. and 13° 11′ 32″ E. on a promontory stretching out into the Mediterranean and forming a small crescent-shaped bay which shelters the harbour from the north winds. The mean temperatures are often lower than in many Italian cities, owing to its situation. Pop. (1928) about 70,000, of whom about 20,000 were Italians, and 15,000 Jews. The crenellated enceinte walls by which the city was surrounded had the form of an irregular pentagon, but have now been, to a considerable extent, demolished. They dated from Roman times, but the earliest portions actually preserved belonged to the Byzantine period, and the greater part to the 16th century. The citadel, dating from the time of the Spanish occupation, now serves as the residence of the governor, and here also is the archaeological museum. The desert almost touches the western side of the city, while on the east is the verdant oasis of Meshia, where are still to be seen the tombs of the Caramanlian sultanas. The aspect of the city is picturesque; the houses (many possessing beautiful gardens) rise in terraces from the seashore. The Turkish quarter contains numerous mosques whose minarets and cupolas break the monotony of the flat-roofed and whitewashed houses. The Pasha mosque (originally a church built by the Spaniards) has an octagonal minaret, but the most beautiful is the Gurgi mosque (1833). Many of the streets are arcaded. Near the port stands a Roman triumphal arch, quadrifrontal in form, made entirely of white marble, and richly embellished with sculpture. It was erected in A.D. 163.

The modern part of the city, to the south-west of the old town, contains a number of official buildings, a cathedral, the Victory monument, theatres, hotels, etc., most of them along the fine new sea-front called Lungomare Conte Volpi, in honour of the former governor (1921–25). There is also a large tobacco factory, and important military buildings, artillery factories, supply base, hangars, etc., as well as a hospital.

The harbour has been dredged to an adequate depth for an area of 1,200 ac., and the quays provided with modern appliances. In 1927, 1,603 ships, with a tonnage of 1,182,770, entered and cleared the port, representing a traffic (inward and outward) of 163,487 tons of merchandise and 58,725 passengers. There is regular communication by sea with Syracuse (via Malta), and also w Tunis, and with Misurata and the ports of Cyrenaica as far Tobruk, and weekly air service has been instituted from Rome Syracuse. There are productive saltworks, and beer is made fr barley grown locally and in Cyrenaica.

The oasis of Tripoli is very fertile and beautiful; its total s face is about 25 sq.m., and it contains about 4,000 houses, 8, wells and a million trees. At Sidi Mezri there is an import Governmental agricultural experimental station.

The ancient Oea (one of the cemeteries of which has been covered) was probably founded by Phoenicians from Sicily. became a Roman colony after the fall of Carthage. It owed importance in the middle ages and subsequently to the destruct of Sabratha and Leptis Magna by the Arab invasion in the 1 century. In 1510 Tripoli was taken by Navarro; in 1530 it granted to the Knights of St. John; but in 1551, it was lost ag and attempts to retake it, organized by Philip II. of Spain led by Andrea Doria, came to nothing, the expedition being feated at Jerba. It subsequently became a nest of pirates.

TRIPOLI, a city in Syria, and the seat of administration the sanjak of North Lebanon in French mandated territory, m *Tarābulus*. It is situated about 2 m. inland from its port El-Mi to which it is joined by a tramway. Pop. 36,000 (26,000 Muslim Although there is no harbour, strictly speaking, there is s anchorage on each side of the peninsula on which El-Mīna star and small craft can shelter behind an old Phoenician breakwa The city has a French garrison, and a number of mission and ot schools. The chief industries are soap manufacture, sponge f ing, tobacco cultivation, and fruit growing. It has an export tr in fruit (especially oranges), eggs and cotton.

History.—Tripoli is known only by its Greek name. Foun after 700 B.C., it became in the Persian period the capital for Phoenician triple federation—Sidon, Tyre and Aradus. Each the three had its own district in the "triple town," which at t time stood on the El-Mīna peninsula. The Seleucids and Rom extended and embellished the city. The Muslims took possess in A.D. 638. In 1109 it surrendered to Raymond of St. Giles, a a five years' siege. A great library founded by 'Ammār, the ru family, and consisting, it is said, of 100,000 volumes, was c signed to the flames. When Sultan Kalā'ūn of Egypt took town in 1289 it was destroyed, and a new city arose on the pres site. Tripoli was often a disputed possession of the rival princes Aleppo and Acre. In 1834 during the Egyptian conquest of Sy it was made a centre of administration. British cavalry armoured cars took possession of it on Oct. 13, 1918. It was corporated in the State of Grand Liban by an *arrêté* of the Fre high commissioner (Gen. Gouraud) on Aug. 31, 1920. (E. Ro.

TRIPOLITANIA, an Italian colony in North Africa, w an approximate area of 360,000 sq.m., mostly desert. It is boun on the north by the Mediterranean, on the west and south Tunisia and French West and Equatorial Africa, and on the e by Cyrenaica (*q.v.*). Pop. (1921) Europeans 20,716, of wh 18,093 were Italian: natives (1927) about 550,000, mostly Ar Berbers and Jews. The chief towns, all on the coast, are Tri (*q.v.*) (pop. 14,000) and Misurata (pop. 14,000).

Economic Conditions.—The agricultural possibilities, es cially those of the cultivation of grain on a large scale, are so what uncertain, owing to climatic conditions; while tropical tivation (coffee, etc.) would be impossible without costly irri tion works. Arboriculture, on the other hand, is believed to h a very considerable future: it has been estimated that at least million olive trees could be planted there, and vines, oranges other fruit trees are also successful. Date palms flourish, bar (for beer), henna, castor oil, esparto grass and tobacco are gro and salt, hides, wool and silk worms are produced. Since 19 389,620 ac. of land concessions have been taken up by Ita immigrants: and there would be room, it is thought, for as ma as 100,000 selected Italian farmers and their families. The forestation of the sand dunes has been begun, with tamar mimosa and eucalyptus. Sponge fisheries (40 tons in 1927) tunny fisheries (500 tons) are carried on. The Government built a railway along the coast westward from Tripoli to Zu

..) and begun a line eastwards to Homs, which runs as far as
ra (13 m.). Another railway (31 m.) runs inland from
li to El 'Azizia, and is to be continued to Ghariiani and the
Motor roads run from Bu-Chemmex on the Tunisian
er, through Zuara and Tripoli, to Homs, Misurata and Sirte,
outhwards as far as Misda and Bu Njem, forming the first
n of the two caravan routes to Murzuk, by Tachertiba
e the route to Ghat, and thence to Kano, branches off), and
kna and Zuila (where the route to Kufra diverges). An-
route runs from Tripoli to Ghadames and thence to Ghat.
ue is largely derived from import duties, which give pref-
e to Italian products. The value of imports in 1922 was
00, while that of exports was only £145,000. In 1926 the
of imports was £2,112,000 and of exports £323,000. The
y has been a considerable burden to the Italian Treasury,
y through military expenditure. The military establishment
26–27 was some 17,000 men, of whom 4,800 were Italians.
li comprises four distinct regions—Tripoli proper, the Aujila
, Fezzan (*q.v.*) and the oases of Ghadames and Ghat—which
the intervening sandy and stony wastes occupy the space
en Tunisia and Cyrenaica.

ysical Features.—For some distance east of Tunisia the
ard is low and sandy with various oases (Zauia, Zanzur, the
of Tripoli itself, etc.), and is often regarded as a part of
ahara, which, however, begins only some 80 m. farther south,
d the Jebels Nefusi, Yefren and Gharian. The "Jebel," as
ystem is locally called, terminates eastwards in the Tarhona
ts of the Homs (Khoms) coast district, has a mean altitude
out 2,000 ft. and culminates in the Takut (Tekuk) volcano
0 ft.) nearly due south of the capital. It is not a true
tain range, but rather the steep scarp of the Saharan plateau,
encloses southwards the Jefara coast plains, and probably
sents the original coast-line. The Gharian section is scored
ces by the beds of intermittent coast streams, and on its
slopes is clothed with a rich sub-tropical vegetation. Gharian,
65 m. south from Tripoli by motor, and 2,350 ft. above sea-
is the seat of the commandant of the southern territory.
uth of these escarpments, the vast Hammada el-Homra, the
Hammada," an interminable stony table-land covering some
0 sq.m. occupies the whole space between Tripoli proper and
ezzan depression. The now uninhabited and waterless Ham-
formerly drained through several large rivers, such as the
s Targelat (Uani, Kseia), Terrgurt, Sofejin, Zemzem and Bel,
-eastwards to the Gulf of Sidra (Syrtis major). Southwards
ble-land is skirted by the Jebel Welad Hassan, the Jebel es-
the Jebel Morai-Yeh, and other detached ranges, which have
mal west to east trend in the direction of the Aujila oases,
a little above the level of the plateau, but falling precipi-
y towards Fezzan. The Jebel es-Suda (Black Mountains),
conspicuous of these ranges, with a mean altitude of 2,800
kes its name from the blackened aspect of its limestone and
tone rocks, which have been subjected to volcanic action,
g them the appearance of basalt. Eastwards this range rami-
nto the two crescent-shaped chains of the Haruj el-Aswad
Haruj el-Abiad ("Black" and "White" Haruj) which rise
700 ft. above the Red Hammada.

yond the barren Ghadama district in the north of the Ham-
the dreary aspect of the wilderness is broken by several
s under grass, corn and date-palms, and containing some per-
nt reservoirs in the beds of the Wadis Sofejin and Zemzem,
e the plateau falls from a mean height of 2,000 ft. to 1,000
530 ft. respectively. But it again rises rapidly southwards
somewhat uniform level of 1,600 or 1,700 ft., and here the
caravan route from Tripoli to Murzuk and Lake Chad
rses for a distance of fully 130 m. a monotonous region of
tone, underlying clays, marls, gypsum and fossiliferous
ous deposits.

at and Ghadames.—Ghat stands 2,400 ft. above the sea,
e Wadi Aghelad in the Igharghar basin, and consequently
gs, not to the Fezzan depression but to the Saharan plateau.
Aghelad, or "Passage," trends north to the Iasawan valley
the east foot of the Tasili plateau, that is, the divide between
the waters which formerly flowed north to the Mediterranean, west to the Atlantic, and south to the Niger and Chad basins. Ghat, which is skirted eastwards by the Akakus range, is a sandy plain dotted over with clumps or groves of date-palms. In the centre is an open space where is held a great annual fair, and to this, combined with its position on one of the caravan routes across the desert, the oasis owes all its importance. For several years, at the end of the 19th and beginning of the 20th centuries, the only caravan route used from the Niger countries to Tripoli was by way of Ghat, disturbances in Bornu and raids by Tuareg having closed all other routes. There is, in the oasis, a population of perhaps 10,000 nearly all Ihajenen Tuareg, about half of whom live in the town of Ghat (350 m. S. of Ghadames and 250 S.W. of Murzuk), which appears to be a relatively modern place. Ghadames (*q.v.*) on the contrary, is ancient.

Climate, Flora and Fauna.—The climate of Tripoli is very variable; cold nights often succeed warm days. The rainfall in the northern regions varies from 5 in. to 15 in. a year—December, January and February being the rainy season. The mean temperature on the coast lands is 68°; it is 5° higher at Ghadames. The flora in the greater part of the colony is Saharan, the date-palm being the characteristic tree. The gum-yielding acacia, the tamarisk, sapan, mastic and pistachio are found in the wadis, and *shi* (wormwood) grows in clusters on the stony plateaus. In parts of the coast belt the flora is more varied generally. In these regions the laurel, myrtle and other evergreens are fairly common, and the oak, cypress, pine, carob and other tress occur, notably the olive, found also in the oases. Other fruit trees are the almond, fig, pomegranate, quince and apricot.

The larger wild animals are scarcely represented in Tripoli. The wild boar is found in Jebel Akhdar, the hyena, fox and jackal in the deserts. The mouflon, gazelle, hares, rabbits and marmots are among the commoner animals. Reptiles include the horned viper and the gecko. The characteristic animal is the camel, found only in the domesticated state. Horses and cattle are bred, but the horses are not numerous; goats and a fat-tailed variety of sheep are kept in large numbers. Birds include the ostrich, vultures, hoopoes, wood pigeons and doves. Bees are numerous and honey forms an article of export.

Tripoli no doubt owes its stability in large measure to its position over against Sicily at the northern terminus of three great historic caravan routes, one of which runs due south to Lake Chad through Fezzan and Bilma, that is, across the narrowest part of the Sahara; another runs south-west through Ghadames and Ghat to Timbuktu and Kano, and the third south by east through Sokna to Wadai and Darfur. East of Tripoli are the small seaports of Homs (Khons) and Lebda: while Misurata is more important both as a harbour and for its manufacture of carpets. To the east of Misurata is the inhospitable sandy waste of the Gulf of Sidra (anc. *Syrtis Major*) so much dreaded by sailors in antiquity. The caravan trade consists largely in leather objects and Sudanese cotton fabrics: but it has now lost much of its importance owing to the French occupation of Timbuktu and the building of the railway from Lagos to Kano. (X.)

See H. Vischer, *Across the Sahara* (1910) for a description of a journey from Tripoli to Lake Chad. *See* also R. Calzini, *Da Leptis Magna a Ghadames* (1926); R. Bartoccini, *Le Antichità della Tripolitania* (Milan, 1926); *La Rinascità della Tripolitania* (Milan, 1926).

HISTORY

Tripolitania, also commonly called Tripoli simply, was originally a Phoenician colony. The wars between the Libyans and the ancient Egyptians do not come properly into the history of Tripolitania. (*See* EGYPT.) Before the colonization of the neighbouring territory to the east by the Greeks (*see* CYRENAICA) the Phoenicians appear to have founded the cities of Sabrata, Oea and Leptis Magna. Oea, which stood between the other cities, became the capital of the country and was named Tripolis (the "Three Cities"). These towns commanded the trade of the central Sudan, caravans regularly crossing the Sahara, there at its narrowest. The early history of the two regions, Cyrenaica and Tripolitania, was similar. Cyrenaica passed from the Greeks to the Ptolemies

and from them to the Romans. Tripolitania, adjoining westward Carthaginian territory, fell under the sway of Carthage and, following its fortunes, became eventually a Roman province.

In the 5th century both Tripolitania and Cyrenaica were conquered by the Vandals, whose power was destroyed by the Byzantine general Belisarius in the following century. In the middle of the 7th century north Africa was overrun by the Arabs, and Christianity gave place to Islam. From this period dates the decay of a civilization which had lasted about 1,000 years. Tripolitania became subject to the successive rulers of Tunisia. It was pillaged in 1146 by the Normans of Sicily. In 1321 the Beni Ammar established an independent dynasty, which lasted with an interval (1354–69), during which two sovereigns of the Beni Mekki reigned, until 1401, when Tripolitania was reconquered by the Tunisians. In 1510 Ferdinand the Catholic of Spain took the city of Tripoli, and in 1528 it was given to the knights of St. John, who were expelled in 1553 by the Turkish corsairs Dragut and Sinan. Thus the country fell to the Turks, though after the death of Dragut the connection with Constantinople seems to have weakened. The Tripolitan pirates soon became the scourge of the Mediterranean; half the states of Europe seem at one time or other to have sent fleets to bombard the capital of the country, nor was piracy stopped until after the French occupation of Algiers in 1830. In 1714 Ahmed Pasha Caramanli achieved practical independence. He and his descendants governed the country as a regency, the claims of the Porte being recognized by the payment of tribute, or "presents." In the early part of the 19th century the regency, owing to its piratical practices, was twice involved in war with the United States. In May 1801 the pasha demanded from America an increase in the tribute ($83,000) which the Government of that country had paid since 1796 for the protection of their commerce from piracy. The demand was refused and a naval force was sent from America to blockade Tripoli. The war dragged on for four years, the Americans in 1803 losing the frigate "Philadelphia," the commander (Captain William Bainbridge) and the whole crew being made prisoners. The most picturesque incident in the war was the expedition undertaken by William Eaton (*q.v.*), with the object of replacing upon the Tripolitan throne an exiled pasha, elder brother of the reigning sovereign, who had promised to accede to all the wishes of the United States. Eaton, at the head of a motley assembly of 500 men, marched across the desert from Alexandria, and with the aid of American ships succeeded in capturing Derna. Soon afterwards (June 3, 1805) peace was concluded, the reigning pasha relinquishing his demands, but receiving $60,000 (about £12,000) as ransom for the "Philadelphia" prisoners. In 1815, in consequence of further outrages, Captains Bainbridge and Stephen Decatur, at the head of a squadron, again visited Tripoli and forced the pasha to comply with the demands of the United States.

In 1835 the Turks took advantage of a civil war to reassert their direct authority. They administered the country as an ordinary vilayet (province) under a pasha. Turkish rule was marked by occasional, spasmodic, and mainly ineffective efforts to develop the country. When in 1881 the French seized Tunisia the Turks were alarmed and greatly strengthened their garrison in Tripolitania. Disputes followed as to the extent of the Tripolitan hinterland, which the French endeavoured to circumscribe. It was not only the French that the Turks had to fear. Italy had looked upon Tunisia as her heritage and, baulked in that direction, she now fixed her eyes upon Tripolitania and Cyrenaica. More or less definite understandings were reached on the subject with other European Powers interested. For another generation, however, the Turks remained undisturbed and under the impetus of the Pan-Islamic movement Turkish authority was pushed far south, a Turkish garrison even occupying the oasis of Bilma in 1910. Meanwhile, Germany was making endeavours to secure economic and, as a result, political predominance in both Tripolitania and Cyrenaica. This led to action by Italy; war was declared upon Turkey in Nov. 1911 and both Tripolitania and Cyrenaica were declared to be under the full sovereignty of Italy. (For the war *see* ITALO-TURKISH WAR.) When the Treaty of Lausanne was signed in Oct. 1912 the Italians, however, held only the coast region, and they met with considerable opposition from the nati (Berbers and Arabs) in their occupation of the interior. But Aug. 1914 every place of importance in the vilayet, includ Fezzan, was in Italian hands. Meanwhile in the coast distr the Italians had begun with great energy a big programme public works, while towards the Arabs and Berbers they adop a policy of confidence and trust.

Unfortunately, in Cyrenaica the war continued, the Turks h ing incited the Senussites to continue the struggle. (*See* SENUS In Sept. 1914 the Fezzani, many of whom adhered to the Sen sect, rose in revolt. Turkish, German and Senussi propaganda very active throughout Tripolitania, and the declaration of wa Italy upon Austria (May 28, 1915) was the signal for a gen rising. After some hesitation the Italians, in view of the situa in Europe, abandoned the whole country, with the exceptio the seaports of Tripoli and Homs (Khoms). Another seap Zuwara, was reoccupied in Aug. 1916. Meanwhile, a brothe the Senussi chief ruled in Fezzan; Suleiman el Baruni, a Be chieftain who had given much trouble in 1912–13, reappe (Sept. 1916) with a firman from the sultan of Turkey appoin him governor-general of the vilayets of Tripoli, Tunis and Algi Ramadhan el Shtewi, another powerful chieftain, establishe so-called republic of Tripoli and ruled at Misurata, which p became a German submarine base. There was, however, l cohesion and much jealousy among the opponents of Italy.

Such was the state of chaos in the country at the end of World War, and the Italians were then in no mood to under the reconquest of Tripolitania by force. There was little improvement in the situation until Giuseppe Volpi became ernor in Aug. 1921. Under his direction a campaign, which be in Jan. 1922 with the reoccupation of Misurata, was conducte a successful issue by the end of 1923. Thereafter, by wise conciliatory measures and by a bold policy of economic re struction, Volpi restored order and a degree of prosperity large part of the country, though Fezzan was still troubled rival factions. In the latter part of his governorship Volpi had full support of the Fascist Government. For his services he created Count Volpi of Misurata. On resigning his post in 1925 he became minister of finance in the Italian cabinet. successor as governor was General de Bono.

In 1927–28 systematic military operations were carried ou the Italians which resulted in the occupation of the district— a no man's land—at the eastern end of the gulf of Sidra, wh Tripolitania and Cyrenaica meet. By these operations the Ital came into effective control of all the region north of the Sah A visit paid by the king and queen of Italy to Tripoli and o towns in April 1928 may be taken to mark the completion of task of establishing order and security in the colony. (*See* fur CYRENAICA and SENUSSI.)

RIPTOLEMUS, an agricultural hero of Eleusis, first priest emeter, and founder of the Eleusinian mysteries. His name is oubtful meaning ("he who ploughs or toils thrice"; *i.e.*, dili-y?); in some legends he is the inventor of the plough. In the known legend (Apollodorus, i.) Triptolemus was the son of us, king of Eleusis, and Metaneira. Demeter, during her h for her daughter Persephone, arrived at Eleusis in the form n old woman. Here she was hospitably received by Celeus, out of gratitude would have made his son Demophon im-al by anointing him with ambrosia and destroying his mortal by fire; but Metaneira, happening to see what was going screamed out and disturbed the goddess. Demophon was t to death, and Demeter, to console his parents, took upon lf the care of Triptolemus, instructed him in everything con-d with agriculture, and presented him with a wonderful ot, drawn by dragons, in which he travelled all over the d, spreading the knowledge of her gifts. In another account ginus, *Fab.* 147) Triptolemus is the son of Eleusinus, and the place of Demophon in the above narrative, but does lie. In the Homeric hymn to Demeter, Triptolemus is simply of the nobles of Eleusis, who was instructed by the goddess r rites and ceremonies. The Attic legend represented him as of the judges of the underworld. He is often represented in and formed the subject of a play (now lost) of Sophocles. altar and threshing-floor were shown on the Rarian plain near sis; hence he is sometimes called the son of Rarus.

Preller-Robert, i., 767, and the classical dictionaries.

RIPTYCH, a painting, carving or other decorative design, uted on three compartments or panels, so constructed that two wings may fold on hinges over the centre-piece (Gr. *τρυχος*, three-fold). The backs of the wing-pieces are often painted, carved or otherwise decorated. The subject of the pieces are usually appropriate and subsidiary to that of the e. The triptych is most frequently designed as an altar-. An earlier use of the term is for a set of three wooden or writing-tablets, hinged or otherwise fastened together, the al tablet being waxed on both sides for the impression of the or writing implement, the outer tablets only on the inside. three tablets thus formed a small book.

RIPURA (formerly called *Hill Tippera*), a feudatory State ndia, adjoining the British district of Tippera, in Bengal. 4,116 sq.m.; pop. (1921) 304,437; estimated revenue Rs. ,000 (including revenue from estates in British India). ura comprises six parallel ranges of hills running from north uth, at an average distance of 12 m. apart. The hills, of which ighest is 3,200 ft. above sea-level, are covered for the most with forest and bamboo jungle, while the low ground abounds trees of various kinds, canebrakes and swamps. The forests er wild elephants, bison, tigers, leopards and deer. The princi-rop and food staple is rice. Half the population consists of ras, a tribe of Mongolian origin. The capital is Agartala (pop. 7,743), where there is an Arts college.

Tripura represents the remnant of an ancient kingdom which at various times extended in the north to Kamrup and in the east to Arakan. Ralph Fitch, who travelled through the country in 1585, noted that "the king of Tippara had almost continual wars with the Arakanese." The country now included in the Tippera district was conquered by the Mughals and annexed in 1733, but Tripura still remained under its own line of rulers. When the East India company obtained the *diwani* or financial administration of Bengal in 1765, they placed a Rajah on the throne, and, since 1808, each successive ruler has received investiture from the British government. The present ruler is H. H. Maharajah Manikya Bir Bikram Kishore Deb Barman Bahaden, who succeeded in 1923.

The District Magistrate of Tippera is ex-officio Political Agent for the State, and the governor of Bengal acts as Agent of the Governor-General for supervising the administration.

TRISECTRIX; *see* CURVE, SPECIAL.

TRISTAN or **TRISTRAM,** one of the most famous heroes of mediaeval romance. In the earlier versions of his story he is the son of Rivalîn, a prince of north-west Britain, and Blancheflor, sister to King Mark of Cornwall. Rivalîn is killed in battle, and Blancheflor, after giving birth to a son, dies of grief. The boy is brought up as his own by Roald, or Rual, seneschal of the kingdom, who has him carefully trained in all chivalric and courtly arts. With the possible exception of Horn, Tristan is by far the most accomplished hero in the whole range of knightly romance; a finished musician, linguist and chess-player, no one can rival him in more knightly arts, in horsemanship or fencing. He has besides, the whole science of *vénerie* at his fingertips. In fact, Tristan is the "Admirable Crichton" of mediaeval romance; there is nothing he cannot do, and that superlatively well—it must be regretfully admitted that he is also a most accomplished liar. Being kidnapped by pirates, Tristan is carried to Cornwall where he finds his way to the court of his uncle, King Mark, who is at first unaware of his identity, but, on learning it, joyfully accepts him as nephew and heir. He defeats the Irish giant, Morholt, who comes to claim the tribute payable every third year by Cornwall, but is desperately wounded in the encounter. Set adrift in a boat, Tristan is carried by the waves to Ireland, where he is healed by the queen, sister to Morholt. Later on he returns to ask the hand of the princess Iseult for his uncle, King Mark, and, having slain a dragon which is devastating the country, succeeds in his quest. On the homeward journey Tristan and Iseult, by misadventure, drink of the love-potion prepared by the queen for her daughter and King Mark. Henceforward the two are bound to each other by an imperishable love which dares all dangers and makes light of hardships. The greater part of the romance is occupied by plot and counter-plot; Mark and the courtiers seeking to entrap the lovers, who by their wiles escape the snares laid for them. Finally, the two are discovered under circumstances which admit of no evasion, and Tristan is obliged to flee to Brittany. There, believing himself to be forgotten, he weds Iseult of the White Hand, daughter of the duke, but makes her his wife only in name. Wounded by a poisoned weapon he sends to Iseult of Ireland to come and heal him. If she accedes to his request the ship on which she embarks is to have a white sail, if she refuses, a black. Actuated by jealousy, his wife, who has discovered his secret, seeing the ship approach on which Iseult is hastening to her lover's aid, tells him that it carries a black sail. Tristan, turning his face to the wall, dies, and Iseult, arriving too late to save her lover, yields up her life in a final embrace.

Whether or not this beautiful story reposes upon a genuine historic tradition, the legend of Tristan and Iseult was one of the most popular themes of mediaeval romance; it was translated into many tongues, and the episodes are preserved in miniatures, carvings and embroideries. The earliest form of the story is still a matter of debate. Prof. Zimmer held that the main incidents were of historic origin, dating from the period of the Viking rule in Ireland. The name of Iseult's father, Gormond, is certainly Scandinavian, and she herself is noted for her golden hair; she is a northern, not a Celtic, princess. The name of Tristan, on the

other hand, has been referred to the Pictish Drustan, and the story is now generally admitted to be of insular origin. Some think that the story was first told in the form of short episodic *lais,* which were later on woven into longer poems. On the other hand that distinguished scholar, M. Bédier, maintains that there was but one poem at the root of all the varying versions of the *Tristan* story, and that that work, composed in the 12th century by an unknown Anglo-Norman poet, was of such force that it determined for all time the form of the tradition. There certainly was an important *Tristan* poem, composed in the 12th century by an Anglo-Norman named Thomas, which was translated into German, English and Scandinavian. Only fragments now remain, but they are sufficient to show that the original was a work of outstanding merit. The German translation, by Gottfried von Strassburg, which seems to have followed the original closely, is a very beautiful poem and one of the classics of the middle ages.

Besides the version of Thomas we have a fragment by a certain Béroul, also an Anglo-Norman, and a German poem by Eilhart von Oberge, both of which derive from a common source. There also exists in two mss. a short poem, *La Folie Tristan,* relating how Tristan, disguised as a fool, visits the court of King Mark. This poem is valuable, as, relying upon the sufficiency of his disguise, Tristan audaciously gives a *résumé* of his feats and of his relations with Iseult, in this agreeing with the version of Thomas. The "Gerbert" continuation of the *Perceval* contains the working over of a short *Tristan* poem, called by him the *Luite Tristan;* the latter part, probably a distinct poem, shows Tristan, in the disguise of a minstrel, visiting the court of Mark.

Finally, in consequence of the popularity of the cyclic version of the Arthurian romances, the original *Tristan* story was worked over in prose form, and incorporated with the final version of the Arthurian legend, where it served to swell the already unwieldy bulk of the romantic *corpus* to an impossible extent. Little of the primitive story is here preserved, and its original tragic beauty is obscured by an interminable series of "banal" adventures. It was in this form that Malory knew it. Fortunately for the present generation the genius of Richard Wagner, inspired by the text of Gottfried von Strassburg, has restored the story to its earlier form, and enshrined it in imperishable music.

Weston, *Romania,* vol. xxxv., 1906). Gottfried's *Tristan und Isolde* has been several times published; the best editions are those of Bechstein (1890) and Golther (1889). There is an English prose rendering by J. L. Weston (*Arthurian Romances,* No. II.). A detailed analysis of the contents of the prose romance, compiled from the mss. of the Paris library, was published by E. Löseth, *Le Roman en prose de Tristan* (1890). For a study of the sources *see* Gertrude Schoepperle, *Tristan and Isolt* (2 vols., 1890), and for a bibliography of the extensive *Tristan* literature, J. D. Bruce, *The Evolution of Arthurian Romance* (1923). (J. L. W.)

TRISTAN DA CUNHA, the general name for a group of three small volcanic islands belonging to Great Britain, situated in the south Atlantic, the summit of the largest being in 37° 5′ 50″ S., 12° 16′ 40″ W. They are midway between Cape Colony and South America. The islands rise from the submarine elevation which runs down the middle of the Atlantic. The depth between the islands is in some places over 1,000 fathoms.

Tristan, the largest and northernmost island, has an area of 16 sq.m., is nearly circular in form, about 7 m. in diameter, and has a volcanic cone (7,640 ft.), usually capped with snow, in the centre. Precipitous cliffs, 1,000 to 2,000 ft., rise from the ocean on all sides, except the north-west, where there is an irregular plateau of about 12 sq.m., 100 ft. above the sea. A stream crosses the northern end of the plateau, falling over the cliff edge in a fine cascade. The crater of the central cone contains a freshwater lake about 150 yd. in diameter. This and other crater lakes are said never to be frozen over.

Inaccessible island, the westernmost of the group, is about 20 m. from Tristan. It is quadrilateral in form, the sides being about 2 m. long, with cliffs about 1,000 ft., its highest point (1,840) is on the west. At the base of the cliffs in some places are narro fringes of beach.

Nightingale island, the smallest and most southern of the grou is 10 m. from Inaccessible island. Its area is not more than 1 s m. Its coasts are surrounded by low cliffs, from which there is gentle slope up to two peaks (1,100 ft. and 960 ft. high). The are two small islets—Stoltenkoff (325 ft.) and Middle (150 ft —and several rocks adjacent to the coast.

The rocks of Tristan da Cunha are basalt, porphyritic basa dolerite, augite-andesite, palagonite, volcanic tuff and ashes. block of gneiss in the crater indicates a continental foundati of the island. The caves in Nightingale island indicate that has been elevated several feet. On almost all sides the islands a surrounded by a broad belt of kelp, the gigantic southern seawe (*Macrocystis pyrifera*), through which a boat may approach t rocky shores even in stormy weather. There is no good anchora in rough weather.

The prevailing winds are westerly. December to March is t fine season. The climate is mild and on the whole healthy, t temperature averaging 68° Fahr. in summer, 55° in winter—som times falling to 40°. Rain is frequent; hail and snow fall occ sionally on the lower grounds. The sky is usually cloudy. T islands have a cold and barren appearance. The tide rises a falls about 4 ft.

History.—The islands were discovered in 1506 by the Port guese admiral Tristão da Cunha. Thereafter the islands (whi were uninhabited) were occasionally visited by outward bou ships to the Indies. Attempts to form settlements were made the Dutch in 1656, and by the English East India company a f years later, but the first permanent inhabitant was one Thom Currie, who landed on the island in 1810. At this time Americ whalers frequented the neighbouring waters and, in the same ye an American named Lambert and a man named Williams ma Tristan their home, but they were drowned while out fishing May 1812. Currie was joined by two other men and they bus themselves in growing vegetables, wheat and oats, and in breedi pigs. Owing to the fact that the islands were used as a base American cruisers raiding British merchant ships, the islands w formally annexed to Britain as dependencies of Cape Colony Aug. 14, 1816. A temporary garrison was placed on Tristan, a when it left, William Glass, his wife and two children and t masons were left behind, and shipwrecked mariners, colou women from Cape Colony, and British, Dutch, Italian and Asia settlers have since made their home there. The settlers grew wh (since made impossible owing to the ravages of rats) raised cat sheep and pigs, grew apples and peaches, and engaged in s fishing. They had of necessity to make their settlement on plain on the north-west of Tristan; here a number of substant stone cottages and a church were built. It is named Edinbu in memory of a visit in 1867 by the duke of Edinburgh. In Oc ber 1873 the islands were carefully surveyed by the "Challenge The visits of whalers were considerably reduced during the Am can Civil War, to the loss of the inhabitants of Tristan. In 18 the population was 109, in 1885 15 men were drowned in a lifeb disaster, in 1897, the population was 64, in 1909, 95 and in 19 130. They manage their own affairs without any written la Frequent attempts have been made to induce some or all of population to leave and land has been offered to them in So Africa, but has not been accepted. Their life is a hard one, t chief food is the potato and fuel is very scarce. The inhabita are described as moral, without intoxicating liquors, religio hospitable to strangers, well mannered and industrious, heal and long lived. They are daring sailors, and in small canvas bo of their own building voyage to Nightingale and Inaccess islands. They knit garments from the wool of their she are good carpenters and make serviceable carts. Guano occurs Nightingale, Inaccessible and Gough islands, but does not app to be worked.

Gough Island.—Gough island or Diego Alvarez lies in 40° S., 9° 44′ W., and is 250 m. S.S.E. of Tristan da Cunha. It i volcanic origin, is rugged and mountainous, the highest peak ri to 4,380 ft. The island is about 8 m. long by 4 m. broad. I

us cliffs, from 200 to 1,000 ft. high, characterize the coast. are divided by picturesque valleys. Streams fall over the into the sea in fine cascades. There are vast numbers of ins and valuable guano deposits. It is also the home of rous seals. Originally called Diego Alvarez, it derives its name from a Captain Gough who visited it in 1731. It has claimed as a British possession since the annexation of n da Cunha. In 1904 Gough island was visited by the Ant- exploring ship "Scotia" of the Bruce expedition, which dis- ed a rich marine fauna, two new buntings and three new s of plants. It has no permanent population.

RITUBERCULATA or **PANTOTHERIA,** a group of small insect-eating mammals from the Jurassic rocks, char- ized by the sharp-cusped lower molar teeth with an inwardly ed phalange (tuberculo-sectorial type). Some of them, such *nphitherium,* are, perhaps, the ancestors of all modern mam- except the platypus and echidna (Monotremata, *q.v.*). *See* MALIA, PALAEONTOLOGY.

RIUMPH, the highest honour bestowed in Rome upon a rious general (Lat. *triumphus*). It was only granted on in conditions, relaxed in special cases. Only those who held ffice of dictator, consul, or praetor were entitled to the dis- on; the war must have been brought to a definite con- n, resulting in an extension of the boundaries of the state; ictory must have been gained over a foreign enemy. The r of granting a triumph rested with the senate. Special ation was necessary to keep the general in possession of the *rium* on his entry into the city. Without this, his command d expire and he would have no right to a triumph. He re- ed outside the city limits until the ordinance was passed; llus on his return from Asia waited outside Rome three .

e triumph, a solemn procession, starting from the Campus ius, passed through the city to the Capitol. The streets adorned with garlands, and the procession was greeted with s of *Io triumphe*. At its head were the magistrates and e, followed by trumpeters and then by the spoils, (arms, lards, statues, etc., representations of battles, and of the s, etc., of the conquered country). Next came the victims ned for sacrifice, especially white oxen with gilded horns. were followed by the prisoners kept to grace the triumph. chariot of the victorious general (*triumphator*) was crowned laurel and drawn by four horses. The general was attired the Capitoline Jupiter in robes of purple and gold; in ght hand he held a laurel branch, in his left an ivory sceptre ounted by an eagle. Above his head the golden crown upiter was held by a slave, who reminded him in the midst is glory that he was a mortal man. Last came the soldiers shouting *Io triumphe*. On reaching the temple of Jupiter on the Capitol, the general placed the laurel branch on the lap of the image of the god, and offered the thank-offerings. A feast of the magistrates and senate concluded the ceremony. Under the empire only the emperors celebrated a triumph, because the generals commanded under the auspices of the emperors as lieutenants (*legati*); the only honour they received was the right of wearing the triumphal insignia (the robes of purple and gold and the wreath of bay leaves) on holidays. The last triumph recorded is that of Diocletian (A.D. 302). A naval triumph was sometimes allowed for victories at sea, the earliest being that celebrated by C. Duilius for his victory over the Carthaginians in 260 B.C.

TRIUMPHAL ARCH, originally an arch built to commemorate a victory of a Roman general, but more commonly used, in a broader sense, for any monumental arch built for purely commemorative or even decorative purposes. The term is also used for the great arch between the nave and apse or the nave and transepts of an early Christian basilica. It is probable that temporary structures spanning a road or street were built by many peoples of antiquity to celebrate the homecoming of a victorious army, but it was the Romans who first made such arches permanent monumental structures, broadened their use for general memorial purposes, and even applied them to the monumental gates of cities and towns. Obviously the building of such a structure as the developed Roman arch would occupy too much time to admit of its being used for the actual triumphal procession that it celebrated; it was, therefore, originally, probably a reconstruction in stone of an earlier, temporary archway.

Although no existing triumphal arches are earlier than the empire, it is known that there was, in the Forum, close to the regia, an arch commemorating the victory of Fabius Maximus Allobrogicus over the barbarians of Savoy in 121 B.C. Augustus built a triumphal arch on the Via Sacra, commemorating the victory of Crassus over the Parthians. From that time on there was hardly an emperor who did not build a triumphal arch somewhere in Rome. The greater number of these have perished, but those of Titus (completed under Domitian *c.* A.D. 80), of Septimius Severus (203–205) and that of Constantine (312), which incorporates much sculpture taken from the earlier arch of Trajan, still remain in good preservation. Many smaller monumental arches also exist in Rome. Both emperors and private citizens built them in all the important centres of the empire. Monumental gateways of triumphal arch type exist in many places in Syria, like that probably of the time of Hadrian at Palmyra, and certain city gates were given the importance of a triumphal arch, especially that of Autun, France (probably 3rd century A.D.) and the Porta Nigra at Trier (4th century).

In the earlier arches, the arch is the most important element, usually with simple stretches of wall on either side. The orders appear only as minor decorative features, either under the arch impost, as at Saintes, or as flat pilasters, carrying a crowning entablature, and placed at the corners of the structure, as at S. Chamas. Only in the arches of Augustus, as at Susa and Aosta, do engaged columns appear, and even then, still as minor decorative elements. It was in the arch of Titus, at Rome, that the later definite arrangement was worked out, in which the columns project boldly, on high pedestals, and carry an entablature that casts a strong shadow. Moreover, arch spandrils are sculptured, and the interior faces of the passage bear remarkable high relief panels, showing the seven branch candlestick and the other trophies of the capture of Jerusalem.

In the triple arch of Septimius Severus, the attic projects out over the end columns, the inscription runs through from end to end, so that the central columns are left without apparent work to do. In the arch of Constantine, on the other hand, the free-standing columns have become, like the pilasters of the early examples, purely decorative features, and each supports a colossal statue, so that despite the crudity of much of the workmanship, this arch gives the most satisfactory effect of any

TYPES OF THE TRIUMPHAL ARCH FROM THE FIRST TO THE 19TH CENTURY

of the later arches in Rome. The Arch of Trajan at Timgad reveals another interesting attempt to relate free-standing columns to the body of an arch, by connecting the two columns of each outer pair with a curved pediment, the attic over the central arch running up to a higher level. The triumphal arch of the early Christian basilica is chiefly remarkable as the position for some of the richest and most beautiful of the wall mosaics that were the chief form of interior decoration. (*See* BASILICA; BYZANTINE AND ROMANESQUE ARCHITECTURE; MOSAIC.)

There is an interesting early Renaissance triumphal arch at Naples (1453–70), to commemorate the entrance of Alphonso I. into Aragon, designed by Pietro di Martino. The most interesting Renaissance and modern triumphal arches are, however, of later date. The Porte Saint-Denis (1672–73), by Blondel and the Porte Saint-Martin (1674–75), by Bullet, both in Paris, depart from the Roman scheme and substitute trophies and reliefs for the orders which the Romans used. Of the more Roman type, is the Arc de Triomphe du Carrousel, Paris (1805), by Percier and Fontaine, based on the arch of Septimius Severus. The Sieges Thor at Munich (1843–50), by Gaertner and Metzger, and the Marble Arch in London, designed in 1828 by John Nash for an entrance to Buckingham palace, and moved to its present position in 1851, are both closely imitated from the Arch of Constantine. The triple arch and screen at Hyde Park Corner, London (1828), by Decimus Burton, is a freer design, but still in the Roman manner. Another noteworthy modern arch is the Washington Arch, New York, by McKim, Mead and White, originally constructed in temporary materials in 1889 in celebration of the 100th anniversary of Washington's inauguration, later reconstructed in marble and completed 1895. By far the largest of all triumphal arches and the most beautiful of modern examples is the Arc de Triomphe de l'Étoile at Paris (begun 1805 from designs by Chalgrin, but not completed till 1836). It is remarkable for its architectural proportions and the great scale and almost stark grandeur of its sculpture, which emphasizes its great width of 147 ft. and height of 160 feet. Under the arch is the tomb of the "Unknown Warrior," over which burns, every night, the continuous "Flamme du Souvenir." (T. F. H.)

TRIVANDRUM, a city of southern India, capital of the state of Travancore, situated 2 m. from the sea-coast. Pop. (1921), 72,784. It is the residence of the maharaja, and contains an observatory, a museum and zoological gardens. Its chief fame centres upon an old temple in the fort, a great resort of pilgrims, round which the city grew up. The city contains the maharaja's law college, a Sanskrit college, a woman's college, technical and training schools and a hospital and medical school.

TRIVIUM, in mediaeval educational systems, the curricul which included grammar, rhetoric and logic (Lat. for cross-ro *i.e.*, where three roads meet, from *tres*, three, and *via*, road). T trivium and the quadrivium (arithmetic, music, geometry a astronomy) together made up as the seven liberal arts.

TRNAVA, a town in Slovakia, Czechoslovakia, on the ri Trnava, was transferred from Hungary by the Treaty of Trian 1920. It is a market town for a rich agricultural region. Ma factures include sugar-refining, starch, beer, shoes and, oldest all, cloth; fertilisers are also prepared. Pop. (1923), 17,745.

TRNOVO [TIRNOVO], a city and capital of a department Bulgaria; 124 m. E.N.E. of Sofia, on the river Yantra, on Trans-Balkan railway, which joins the Sofia-Varna line at Gor Orehovitsa, 8 m. N. of Trnovo. Pop. (1926) 12,802. The c is remarkably situated. The Yantra runs in a deep gor doubling first left, then right, round two promontories, wh stand like high fortresses, surrounded by water on three sic The first of these, the Tsarevitsa, is connected with the rest the town by a high causeway, in part a bridge; the other, Trapesitsa, is entirely isolated. The inhabited town covers two sides of the roof-like ridge which terminates in the Tsarevi On the latter are a ruined tower, known as Baldwin's tower, wh the Frank emperor is supposed to have been imprisoned, a behind it, the somewhat unimposing remains of the palace of Asens (*q.v.*). Few of these ruins have been excavated. T Trapesitsa contains the fragments of several mediaeval churc in the Byzantine style.

Trnovo is believed to have been a Roman fortress; it was birthplace of Tsar Šišman, and the home of the second Bul empire, proclaimed here 1185 by the brothers Peter and I Asen, who were boyars of the Tsarevitsa and Trapesitsa. It v capital of Bulgaria 1186–1394, when it was adorned with gr splendour; most of the relics were destroyed in the earthqu of 1911. It was the seat of the Bulgarian patriarchate from 1 to its abolition in 1767. Trnovo was taken by the Turks on J 17, 1394. It remained, however, a commercial centre. It v captured by Russia in 1877. Prince Alexander of Battenb was here proclaimed Bulgarian prince (1879). Here the Bulgar constituent assembly sat, all meetings of the Grand Sobra (*see* BULGARIA, *Constitution*) are held here, and the independ kingdom of Bulgaria was proclaimed in the church of the Fo Martyrs (Oct. 5, 1908). (C. A. M.)

TROAD: *see* TROY.

TROCHEE or CHOREE, literally the "running" or "dancin foot (- ⏑) (Gr. *τρέχειν*, to run, and *χορός*, a band of dancer Trochaic metre is of several kinds, usually described by number of *metra*, or groups of two trochees, which they conta

dimeter:

Comrades, leave me | here a little

ting of two *metra* or four trochees. The commonest form, ally in ancient drama, is the *tetrameter catalectic* or *sep-us* (four *metra* or eight trochees, lacking the final syllable),

ă Rōmă, | cĕrnĕ quāntă | sĭt dĕum bĕnĭgnĭtās
rades, leave mĕ | here ă little, | while as yĕt 'tĭs | earlў morn.

OCHOPHORE or **TROCHOSPHERE,** the names d to the free-swimming larval form of the segmented worms nelida (*q.v.*) and to the very similar (first) larval stage of amellibranchia (bivalves) and Gastropoda (univalves)) among the Mollusca (*q.v.*).

OCHU, LOUIS JULES (1815–1896), French general, orn at Palais (Belle-Ile-en-Mer) on March 12, 1815. He as a captain in Algeria and as a colonel throughout the an campaign. He commanded a division in the Italian ign of 1859. In 1866 he was employed at the ministry ar in the preparation of army reorganization schemes, e published anonymously in the following year *L'Armée ise en 1867*, a work inspired with Orleanist sentiment, which ht him into bad odour at court. He left the war office on ay, and was refused a command in the field at the out- of the Franco-German War. After the earlier disasters in he was appointed by the emperor first commandant of the s of Châlons camp, and soon afterwards (Aug. 17) governor ris and commander-in-chief of all the forces destined for efence of the capital, including some 120,000 regular troops, mobiles, and 330,000 National Guards. He put Paris in e of defence, and showed himself a master of the passive sive. At the revolution of Sept. 4, he became president of overnment of national defence. His "plan" for defending the ailed; the successive sorties were unsuccessful, and when ulation became inevitable he resigned the governorship of on Jan. 22, 1871 to General Vinoy, retaining the presidency e government until after the armistice in February. He was d to the National Assembly by eight departments, and sat Morbihan. In July 1872 he retired from political life, and in from the army. He published in 1873 *Pour la vérité et pour tice,* in justification of the government of national defence, 1879 *L'Armée française en 1879, par un officier en retraite.* ed at Tours on Oct. 7, 1896.

ROELSTRA, PIETER JELLES (1860–), Dutch ist leader, was born at Leeuwarden and educated for the profession at the University of Groningen, but early aban- it for politics and journalism. He adopted Socialist opin- and becoming dissatisfied with the leadership of Domela enhuis, under whom Dutch Socialism had assumed an ex- st complexion bordering on anarchism, he founded the Democratic Workers' Party in 1894 for the constitutional vement of Socialism. In 1913, the Liberal party offered the lists three seats in a government which would include in rogramme universal suffrage and old age pensions. This stra refused, on the assumption that the entrance of the lists into the government would strengthen the opposition to rsal suffrage. His point of view was approved by the con- ce of the party. At the elections of 1918, as a result of the duction of universal suffrage, the Socialists scored important , and under the influence of the German revolution, Troelstra, remarkable speech in the chamber, called upon the govern- to resign with a view to the formation of a socialist state. eading members of his party repudiated his tactics but pres- was brought to bear upon the government, which resulted e eight-hour day and other reforms. Thenceforward Troel- influence with the proletariat increased steadily, until in owing to failing health, he retired from politics.

ROGIR or **TRAU,** a seaport of Dalmatia, Yugoslavia. (1921) 3,354. The town is built upon an island, connected the mainland by a bridge. The Venetian loggia is a fine nen of a 16th century court of justice; and the cathedral is one of the glories of Dalmatia. It is Hungarian Gothic, and founded in 1200, was only completed in 1450. Trau is a steamship station with a dockyard, and has some trade in fruit and wine, the fertile soil producing vines, figs, pomegranates and olives. The chief industries are the weaving of *rascia,* a coarse blue serge, and metal work.

Tragurium, by which name it was known to the Romans, was probably colonised about 380 B.C. by Syracusan Greeks from Lissa, and its name is sometimes derived from τράγιλος, a place near Syracuse. In 998 it submitted to Venice; but in 1105 it acknowledged the supremacy of Hungary, while retaining its municipal freedom, and receiving, in 1108, a charter which is quoted by Lucio. After being plundered by the Saracens in 1123, it was ruled for brief periods by Byzantium, Hungary and Venice. In 1242 the Tatars pursued Bela IV. of Hungary to Trau, but were unable to storm the island city, which remained in the possession of Hungary till 1413. The Italians attempted to take possession of the town at the close of the World War (1914–18), but were driven out by the inhabitants, 99% of whom are Slavs.

See T. G. Jackson, *Dalmatia, the Quarnero, and Istria* (Oxford, 1887); E. A. Freeman, *Sketches from the Subject and Neighbour Lands of Venice* (London, 1881); and G. Lucio, *Memorie istoriche in Tragurio, ora detto Trau* (Venice, 1673).

TROGLODYTES, "cave-dwellers," a name applied by ancient writers to different tribes in various parts of the world. Strabo speaks of them in Moesia, south of the Danube (vii. 318), in the Caucasus (xi. 506), but especially in various parts of Africa from Libya (xvii. 828) to the Red Sea. The troglodyte Ethiopians of Herodotus (iv. 183) in inner Africa, very swift of foot, living on lizards and creeping things, and with a speech like the screech of an owl, have been identified with the Tebus of Fezzan. According to Aristotle (*Hist. An* viii. 12) a dwarfish race of Troglodytes dwelt on the upper course of the Nile, who possessed horses and were in his opinion the Pygmies of fable. But the best known of these African cave-dwellers were the inhabitants of the "Troglodyte country" (Τρωγλοδυτική) on the coast of the Red Sea, as far north as the Greek port of Berenice, as recorded by Diodorus (iii. 31) and Photius (p. 454 Bekker) from Agatharchides of Cnidus, and by Artemidorus in Strabo (xvi. 776).

They were a pastoral people, living entirely on the flesh of their herds, or, in the season of fresh pasture, on mingled milk and blood. But they killed only old or sick cattle (as indeed they killed old men who could no longer follow the flock), and the butchers were called "unclean." They gave the name of parent to no man, but only to the cattle which provided their subsistence. They went almost naked; the women wore necklaces of shells as amulets. They practised circumcision or an operation of a more serious kind. The dead body, its neck and legs bound together with withies of the shrub called *paliurus,* was set up on a mound, and pelted with stones amidst the jeers of the onlookers, until its face was completely covered with them. A goat's horn was then placed above it, and the crowd dispersed with manifestations of joy.

TROGON, the name of birds forming the family Trogonidae. The trogons are birds of moderate size, the smallest hardly bigger than a thrush, the largest less bulky than a crow. The bill is wide at the gape, which is beset by recurved bristles. They seize most of their food on the wing. Their flight is short, rapid and spasmodic. Their feet are weak and of a unique structure, the second toe, which in most birds is the inner anterior one, being reverted; in all other birds that have two toes before and two behind, the outer toe is turned backward. The plumage is beautiful and characteristic, and the glory of the group culminates in the quezal (*q.v.*). The plumage is further remarkable for the absence of down and for the large size of its contour-feathers, which are extremely soft and so loosely seated as to come off in scores at a touch. The tail is a characteristic feature, the rectrices being often curiously squared at the tip. The nidification of these birds is in holes of trees, wherein are laid without any bedding two roundish eggs, generally white, but certainly in one species (quezal) tinted with bluish green.

The trogons form a very well-marked family of Coraciiform

birds placed near the colies (*see* MOUSE BIRD) and swifts (*q.v.*). The remains of one have been found in the Miocene of France. This discovery seems to account for the remarkable distribution of the trogons at the present day. While they chiefly abound in the tropics of the New World, they occur too in the tropical parts of the Old. About sixty species are recognized, which J. Gould in the second edition of his *Monograph* of the family (1875) divides into seven genera.

TROGUS, GNAEUS POMPEIUS, Roman historian from the country of Vocontii in Gallia Narbonensis, nearly contemporary with Livy, flourished during the age of Augustus. The name Pompeius was adopted by his grandfather, who received the citizenship from Pompey. Trogus' books on natural history are frequently quoted by Pliny; his principal work, however, was *Historiae Philippicae* in 44 books, so called because the Macedonian empire founded by Philip is the central theme of the narrative. This was a general history of the world, or rather of those portions of it which came under the sway of Alexander and his successors. Of this great work, we possess only the epitome by Justin, the *prologi* or summaries of the 44 books, and fragments. But even in its present mutilated state it is often an important authority for the ancient history of the East. Ethnographical and geographical excursuses are a special feature of the work.

Fragments edit. by A. Bielowski (1853); *see* also, A. H. L. Heeren, *De Trogi P. fontibus et auctoritate* (prefixed to C. H. Frotscher's edition of Justin); A. Enmann on the authorities used by Trogus for Greek and Sicilian history (1880); A. von Gutschmid, *Über die Fragmente des Pompeius Trogus* (1857); M. Schanz, *Geschichte der römischen Litteratur* (2nd ed., 1899), ii., where all that is known of Timagenes is given; and article JUSTIN.

TROIA, a town and episcopal see of Apulia, Italy, in the province of Foggia, situated 1,440 ft. above sea-level, 7 m. N.W. of the station of Giardinetto-Troia, which is 16 m. S.W. of Foggia. Pop. (1921), 6,420. Troia occupies the site of the ancient Aecae, 12 m. S. of Luceria, on the Via Traiana. Troia was itself founded in 1017 by the Greek prefect Basilius Bugianus. The cathedral dates from 1107, but the upper part of the façade with its rich sculptures, fine rose-window and polychromatic decoration, the choir apse and the interior were restored early in the 13th century. The bronze doors, partly in relief and partly in niello (1119–1127) were cast in Beneventum by Oderisius.

TROILUS, in Greek legend, son of Priam (or Apollo) and Hecuba. In the *Iliad* (xxiv., 257) he is already slain before the action of the poem commences. According to a non-Homeric tradition (*e.g.*, Virgil *Aen.* i. 474), when a mere boy he fell by the hand of Achilles. In another account he was dragged to death by his own horses. His death formed the subject of a lost tragedy by Sophocles. The story of Troilus and Cressida (Caxton, Chaucer, Shakespeare, etc.) is entirely mediaeval.

TROITSK, the name of several Russian settlements, the most important of which is the town of Troitsk in the Uralsk Area, in 54° 4′ N., 61° 35′ E., on the Ui, a tributary of the Tobol. Pop. (1926) 29,643. A fort was erected here in 1743, which became a centre for trade with the Kirghiz steppe and Turkestan. A branch railway now links the town with Chelyabinsk and Sverdlovsk, and it is on the great Siberian road. It has tanneries and flour-mills, the latter supplying the Ural mining district.

TROITSOKOSAVSK, a town of Asiatic Russia, in the Buriat-Mongol A.S.S.R., in 51° 28′ N., 106° E., on the Kiakhta river near its junction with the navigable Selenga, which forms a waterway from Asiatic Russia to Mongolia. Two miles south of it is Russian Kiakhta, on the frontier, which adjoins Chinese Kiakhta or Mai-mai-Chên, a walled town with a large market-place, and 10 m. N., at the confluence of the Kiakhta and Selenga, is Ust-Kiakhta. It was formerly the great route by which Chinese tea entered Russia; and its December fair, when Russian leather, furs and wool were exchanged for tea, was very important. From 1689 to 1727 the trade was a Government monopoly, but from then till 1860 trade was thrown open to private merchants and as all trade across the Chinese frontier was by law compelled to pass through it, the town increased greatly in importance. In 1860, however, the whole frontier was declared open, and Kiakhta declined; the Transbaikal railway further diminished its importance. The combined population of Troitsokosavsk and Kiakh was only 8,903 in 1926. Gold and osmiridium are found in district, and salt is worked. A railway is projected to link V khne-Udinsk with Kiakhta, and this might restore the prosper of the town, as there is a great market for leather in Mongo which has no tanneries; raw hides are often sent via this route be dressed and re-exported. The altitude is 2,600 ft., and climate severe (average January temperature, −18·4° F, aver July, 67·1° F, and of the annual rainfall of 11 in., 7·5 fall July and August). The town was a storm centre in the post r period, and was the scene of the massacre of 800 Bolshe prisoners in 1920 by order of the Cossack ataman Semyonov.

TROJAN PLANETS, a group of asteroids revolving ro the sun in the same period as Jupiter. Joseph Louis Lagrange his essay on the problem of Three Bodies (1772), noted cert simple cases in which an exact solution could be found by elem tary methods. In some of these the bodies remained in a rotat straight line; these cases are unstable, and of little practical portance, though it has been suggested that the *Gegenschein*, Counterglow, may be due to particles connected in this man with the sun and earth. The most interesting case is that in wh three masses (equal or unequal) S, J, T, whose centre of gra is G, are situated at the angular points of an equilateral trian Then, if they are projected in the plane of the triangle, with ve ities proportional to GS, GJ, GT, in directions making equal an with GS, GJ, GT, in the same direction of angular motion, t will describe ellipses in the same period, exactly as though t were particles moving under accelerations directed towards G proportional to their distances from G; further, the triangle S will remain equilateral throughout the motion, though it will v in size unless the orbits round G are circular.

This case, like the others, was regarded simply as a mathem cal curiosity till the year 1906. On Feb. 22 in that year Prof. M Wolf, in the course of the systematic search for new planets t is carried on by photography at Königstuhl Observatory, Hei berg, found a faint planet, provisionally lettered TG, which s sequently received the permanent number 588 and the na Achilles. Its orbit was calculated by Dr. Berberich at the Be Recheninstitut; he found that its period was almost exactly same as that of Jupiter (11·86 years). Thereupon Prof. Charl of Lund Observatory, noting that Achilles was about 55½° in fr of Jupiter, as seen from the sun, suggested that this was an ample in the heavens of the equilateral configuration which grange had deduced by theory. It was seen, of course, that ideal conditions were not exactly fulfilled; the inclination of Ac les to the ecliptic is 10¼°, and its eccentricity $\frac{1}{6}$—much larger t the corresponding elements of Jupiter's orbit. But it was con tured that since the equilateral configuration is stable, these de tions would simply produce periodic oscillations about that c figuration.

Achilles did not long remain the sole example of this type motion; No. 617 Patroclus was found in the same year, and Hector in the following year. Three more members were sub quently found, 659 Nestor, 884 Priamus and 911 Agamemn Of these Achilles, Hector, Nestor, Agamemnon are about ahead of Jupiter (greater longitude), while Patroclus and Priar are 60° behind. It is unfortunate that the obvious plan was followed of giving Greek names to those on one side, Trojan na to the other, but it would cause confusion to change now.

The Trojans seem to be among the larger members of the as oid group. Their diameters, estimated from their light, are of order of 150 miles, which is greater than that of Juno, one of original four asteroids. This diameter, however, is only one fi hundredth of that of Jupiter, so that, even if we assign to th double the density of Jupiter, the mass of each of them is o about one fifty-millionth of his. This is, of course, too small produce any sensible effect on Jupiter, and the point G in the angle may be taken as the centre of gravity of the sun and Jupi This is distant from the sun's centre by $\frac{1}{1048}$ of the side of triangle, or 461,000 miles, which places it just outside the su surface. This is the point which would be the centre of revolut under the strict Lagrangian configuration. It is obvious, howe

ne actual motion is far from exhibiting the Lagrangian sim- and uniformity; the inclination of two of the Trojans is o°, and their eccentricities are also considerable.

question of the stability of the motion under these condi- has engaged the attention of at least three mathematicians. rst in the field was L. J. Linders, who followed a method in- d by Poincaré (*Leçons de Méc. Cél* §64), and obtained a pproximation to the resulting motion, which he found to be within certain limits of departure from the Lagrangian uration. He found that the period of revolution of a Trojan would oscillate between 4,222 and 4,442 days, that of Jupi- ing 4,332 days, or 11·86 years. The greatest departure in from the mean position is 17¼°. He found that there would g period oscillations whose duration is about 150 years. Prof. Brown in 1911 studied the problem on the same lines as Sir G. Darwin had used in his investigations on periodic . He treated the motion of Jupiter round the sun as exactly ar, and referred the motion of the asteroid to the revolving ining Jupiter to the sun. The nearest approach of the aster- Jupiter compatible with stability was found to be about two nomical units, or 23½°. W. M. Smart (1917) carried Lind- work to a further order of approximation, but he still consid- Jupiter as moving in a circle. He showed that the oscillations Trojans could be divided into two classes: (1) those arising ly from the inclination and eccentricity of the Trojans; the d of these is about 12 years. (2) a much slower oscillation, may very approximately be represented as harmonic motion ellipse whose shorter axis is directed towards the sun, the r axis being 18¾ times the length of the shorter. The period ich this ellipse is described is 147·82 years, just 12½ times er's period of revolution.

o further papers by Prof. E. W. Brown deal more directly he actual Trojans than his earlier one, which deals with ideal He reduced the theory to a numerical form, and showed pproximations suffice to represent the observations of Achilles, ding over many years, within a few seconds of arc. He xamined the stability of the motion; it is stable as far as the nd Jupiter are concerned, but the action of other planets es- ly Saturn may in a very long period (of the order of a million) cause the Trojans to approach too near to Jupiter, after the character of their motion will be changed, and they will to be Trojans. However, since the age of the planetary sys- s estimated as thousands of millions of years, and at least six ns still survive, it would seem that such disturbing action on n's part can only under exceptional circumstances lead to the sion of a Trojan; otherwise none of them would survive, for es not appear likely that Saturn can reverse its action, and non-Trojans into Trojans. Any asteroids that had once been ns would continue to make near approaches to Jupiter's orbit. ems possible that the remarkable asteroid 944 Hidalgo (*see* R PLANET) may once have been a Trojan, but no other aster- are known that fulfil the conditions.

e existence of the Trojans suggests that in the early days of lanetary system a large amount of scattered matter was cir- ng round the sun at the same distance as Jupiter, of which rojans have survived in virtue of the stability of their con- tion, while the remainder has had its period changed or been bed by Jupiter.

ne may imagine that, as there are several Trojans on the side of Jupiter with a common point as their centre of oscil- , there is some danger of collision between them. Such dan- very remote, for the length of their swings exceeds 100,000,- ., and these are performed in different directions; also the at which they reach the ends of their swings are different, gh the periods of the different swings are nearly the same for them.

Smart, Paper in *Memoirs of R.A.S.* vol. lxii., p. 79; . Brown, Papers in *Transactions of Yale University Observatory*, ii., parts 1 and 3. (A. C. D. C.)

ROJAN WAR: *see* TROY.

TROLLE, HERLUF (1516–1565), Danish naval hero, was born on Jan. 14, 1516, at Lillö. At the age of nineteen Trolle went to *Vor Frue Skole* at Copenhagen, subsequently completing his studies at Wittenberg, where he adopted the views of Melanchthon, with whom he was in intimate correspondence for some years. His marriage with Brigitte, the daughter of Lord Treasurer Mogens Gjöe, brought him a rich inheritance, and in 1557 he took his seat in the senate. Both Christian III. and Frederick II. had a very high opinion of Trolle's trustworthiness and ability and employed him in various diplomatic missions. Trolle was, indeed, richly endowed by nature, and his handsome face and lively nature made him popular everywhere. His one enemy was his wife's nephew, Peder Oxe, the subsequently distinguished finance minister, whose narrow, grasping ways, especially as the two men were near neighbours, did not contribute towards family harmony. In 1559 Trolle was appointed admiral and inspector of the fleet, and in 1563 he superseded the aged Peder Skram as admiral in chief. On May 10 he put to sea with twenty-one ships of the line and five smaller vessels and, after uniting with a Lübeck squadron of six liners, encountered, off the isle of Öland, a superior Swedish fleet of thirty-eight ships under Jacob Bagge. Supported by two other Danish ships Trolle attacked the Swedish flagship "Makalös" (Matchless), then the largest flagship in northern waters, but was beaten off at nightfall. The fight was renewed at six o'clock the following morning, when the "Makalös" was again attacked and forced to surrender, but blew up immediately afterwards, no fewer than 300 Lübeck and Danish sailors perishing with her. The Swedish admiral was captured, and the remnant of the Swedish fleet took refuge at Stockholm. Despite the damage done to his own fleet and flagship "Fortuna" by this victory, Trolle, on Aug. 14, fought another but indecisive action with a second Swedish fleet under Klas Horn, and kept the sea till Oct. 13. Trolle spent the winter partly at his castle of Herlufsholm completing his long cherished plan of establishing a school for all classes, and partly at Copenhagen equipping a new fleet for the ensuing campaign. On June 1, 1565, he set sail with twenty-eight liners, which were reinforced off Femern by five Lübeck vessels. Klas Horn had put to sea still earlier with a superior fleet and the two admirals encountered off Fehmarn on June 4. The fight was severe but indecisive, and both commanders finally separated to repair their ships. Trolle was severely wounded in the thigh and shoulder, but he insisted on being the last to receive the surgeon's attention. He died of his wounds at Copenhagen on June 25.

TROLLHÄTTAN, a town of Sweden in the district (*län*) of Elfsborg, 45 m. by rail N. by E. of Gothenburg. Pop. (1926), 15,923. It lies on the left (east) bank of the Göta at the point where that river descends 108 ft. in the course of nearly a mile by the famous falls of Trollhättan (six in number) and several rapids. The scenic setting of the falls is not striking, but the great volume of water, nearly 18,000 cu.ft. per second, renders them most imposing. The narrowed river here surrounds several islands, on either side of one of which (Toppö) are the first falls of the series, Toppö and Tjuf. These are 42 ft. in height. The water-power is used in rolling-mills, a cellulose factory and other works. The electric works supply power to Gothenburg and other Swedish towns. (*See* GÖTA.)

TROLLOPE, ANTHONY (1815–1882), English novelist, was born in London, April 24, 1815. He came of a family which engaged in literary pursuits. His father, THOMAS ANTHONY TROLLOPE (1774–1835) was a learned but unbusinesslike barrister, who spent much time on an *Encyclopedia Ecclesiastica* and gave up law for farming, with ruin as the result. His mother, FRANCES MILTON TROLLOPE (1780–1863) went with her husband to Cincinnati to retrieve their fortunes by running a fancy-goods shop, and coming back disappointed achieved notoriety and roused violent resentment by her caustic book, *Domestic Manners of the Americans* (1832). She afterwards wrote some fifty novels and books of travel, and maintained the family by her literary earnings, her best novel being *The Vicar of Wrexhill* (1837) and *The Widow Barnaby* (1839), a fair second. (See *Frances Trollope, her Life and Literary Work*, 1895, by her daughter-in-law.) Her

eldest son, THOMAS ADOLPHUS TROLLOPE (1810–92), was a popular writer of novels and miscellaneous works, largely on Italian subjects, his adopted home being in Florence. His second wife, FRANCES ELEANOR TROLLOPE, also a novelist, collaborated with him in *Homes and Haunts of Italian Poets* (1881).

Anthony, who was the third son, gave an unvarnished account of his unhappy youth in his *Autobiography* (which was edited by his son Henry M. Trollope in 1883), an extraordinarily candid book that had a disillusioning effect on too fervid admirers by giving away the secrets of his workshop. It probably caused the long eclipse of his fame, which has recently been followed by a striking renewal. During the family impecuniosity, he was a day-boy at Winchester and Harrow, and suffered pangs through his shabby and dirty appearance, and the unpopularity and general discouragement which were the result. He reached the verge of manhood almost as ignorant as if he had had no schooling at all, yet he tried to start in life by taking the post of classical usher in a private school in Brussels. But he received the offer of a clerkship in the General Post Office, London, and after a farcical pretence at an examination was appointed (1834). For the seven years of his service here, his salary was small, he was in debt, troubled with awkward love-affairs, and often in hot water with his superiors. Then he was transferred to Ireland (1841) as a surveyor's clerk, with a moderate salary but liberal allowances and the duties of a sort of travelling inspector. The change brought out a business capacity hitherto unsuspected. He enjoyed a comfortable income, he had time in spite of a busy life to indulge freely in hunting, he consorted with people of all classes and began to stock his memory for the long-cherished purpose of trying his hand at fiction, and in 1844 he married an English lady, Rose Heseltine, whom he had met in Ireland, and established himself in a house at Clonmel.

Trollope's first two novels, *The Macdermots of Ballycloran* (1847) and *The Kellys and the O'Kellys* (1848), failures though they proved, are examples of his thoroughness in making himself acquainted with a given sphere of life, as he was afterwards to do with clerical society, political life, and legal affairs, and also of his aptitude for developing a good story casually heard. The first is dark and pathetic, the second has many sparkling scenes; neither is the work of a Carleton or Banim, but both steer clear of the mere stage Irishman of Lever and Lover. Trollope persevered, but a historical novel, *La Vendée* (1850) deservedly fell flat.

A chance visit to Salisbury Close gave him his idea for *The Warden* (1855), the simple, touching, but humorous story of a precentor in a cathedral town, who out of sensitiveness to public criticism resigns the well-paid office of warden to an ancient charity. Mr. Harding and his blustering son-in-law Archdeacon Grantly reappear, with other clerical dignitaries, their wives, families and friends, including the famous "Bishopess," Mrs. Proudie, the unctuous and pushful Mr. Slope, and the epicurean Dr. Stanhope and his disreputable children, in *Barchester Towers* (1857). The "Barsetshire Chronicles" were thus launched, bringing their author praise and, in due time, substantial profit. Trollope was now inspector of rural deliveries for the south-west of Ireland, with a roving commission that suited his tastes, scope for improvements on which he prided himself, and plenty of time for hunting. He is said to have been the inventor of the pillar-box. His ability and his experience of Post Office business led to his being sent on a mission to the West Indies (1858), which gave him material for a travel-book, *The West Indies and the Spanish Main* (1859). Other official journeys took him to Egypt (1858), the United States (1862), Australia and New Zealand (1871–72), and South Africa (1878), and resulted in further gossipy narratives and several tales. He got himself transferred to England (1859), taking charge of the eastern postal district and settling in a house at Waltham Cross. He retired from the Post Office (1867), out of annoyance at being passed over for promotion. Trollope was instrumental in starting the *Fortnightly Review* (1865), edited the *St. Paul's Magazine* (1868), rather disastrously, and was a contributor to *Cornhill, Blackwood* and other periodicals. He stood for Beverley (1868), but only acquired useful experience for future novels of political life.

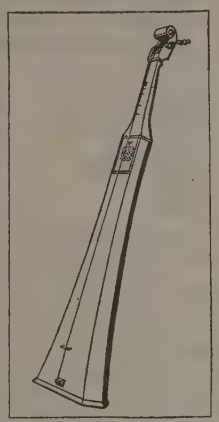
All this time he was steadily writing fiction. The first of books to bring him remuneration was *The Three Clerks* (185 a poor novel of the Civil Service which sold for £250. But bef long, he tells us in the *Autobiography*, he was earning on average £4,500 a year, and in one instance he received £3, for a single book. An enormous output—for, besides more t fifty novels he wrote much else, and believed that no writer made a larger contribution to letters in an equal space of tim was rendered possible by a methodical apportionment of 24 hours. He rose regularly at 5.30 A.M., wrote steadily for hours and a half, at the rate of 250 words every quarter of hour, and thus calculated each book as so many days' work, wh was carefully checked off as it proceeded. Yet he found leis to hunt three times a week during the season, played whist da and had plenty of time for social enjoyments. He lived in Lon for about eight years (1872–80), and then removed to the vill of Harting, under the Sussex Downs. He was staying in t when he died of paralysis, Dec. 6, 1882.

Trollope was a big, bluff, vociferous person, whose bluste and overbearing ways offended some, but whose John Bull p istinism did not conceal an essential honesty and good nature a tender heart. He thought *Pride and Prejudice* the greatest n in the language, and he idolized Thackeray; but he was as from the exquisite art of the one writer as from the perf mastery and irony of the other. With perhaps too much fide to the usual and commonplace, he depicted the great middle c as it was in mid-Victorian times. He was a "character-mong of first-rate quality, who showed his personages moving in t own little spheres, and as he widened his circle of characters t in a larger sweep until he embraced almost as large and diversi a world as that surveyed by Thackeray. Among the charac that stand out, along with the two or three already mentio Mr. Crawley, the grimly pathetic hero of *The Last Chronicle Barset*, the wicked but delightful Signora Neroni, Lucy Roba the best of many admirable heroines (unless Lady Glencora preferred to that place), her husband, Mr. Plantagenet Palli afterwards Duke of Omnium, Lady Lufton, and that shrewd downright person Miss Dunstable, with such different example the unattractive in life turned to artistic account as Mr. Sowe and Mr. Chaffanbrass—these make a notable gallery and are a selection from the catalogue. Other characters show uncertai of touch and a failure of motivation. Trollope was best at a of coarse or at any rate very broad comedy, but he also ha command of real pathos. Tragedy was outside his scope. revelled in mankind's idiosyncrasies, but shirked the closer s tiny into the byways of conscience, just as he was shy of spiritual questions which must, surely, have played some par the lives of his clerical personages. George Eliot, his contem rary, would have dealt with Mr. Harding and Mr. Crawley totally different way.

Besides *The Warden* and *Barchester Towers*, the Barchester s comprises:—*Dr. Thorne* (1858), *Framley Parsonage* (1864), *The S House at Allington* (1864), and *The Last Chronicle of Barset* (18 The best of Trollope outside that series, besides such as are na above, are probably *Orley Farm* (1862), *Can You Forgive* (1864), *Phineas Finn* (1869) and its sequel *Phineas Redux* (18 *The Claverings* (1867), *The Belton Estate* (1866), *He Knew was Right* (1869), *The Vicar of Bullhampton* (1870), *The Eus Diamonds* (1873), *The Way We Live Now* (1875), *The Amer Senator* (1877), *The Duke's Children* (1880), *Ayala's Angel* (18 and *Mr. Scarborough's Family* (1883). Trollope's *Autobiography* edited by his son (1883). The best biography is T. H. S. Esc *Anthony Trollope, His Work, Associates and Literary Originals* (19 which may be supplemented by Michael Sadleir's *Trollope, a C mentary* (1927), H. Walpole's *Trollope* ("English Men of Lett 1928), Leslie Stephen's *Studies of a Biographer*, IV. (1902), He James's *Partial Portraits* (1888), and Professor Saintsbury's "Trol Revisited" (*Essays and Studies by members of the English Associa* VI., 1920). (E. A. BA

TROMBA MARINA or **MARINE TRUMPET,** an solete bowed instrument about 6ft. in length, with an outline so what recalling that of an elongated cricket bat. It consisted body and neck in the shape of a truncated cone resting o triangular base. In the days of Michael Praetorius (1618)

was 7ft. 3in. and the three sides at the base measured 7in., ng to 2in. at the neck. These measurements varied con- bly, as did also the shape of the body and the number of s. The bridge had the curious feature that a portion of its as left loose so that it vibrated against the belly with every nent of the bow, producing a trumpet-like timbre. It is to eature, in conjunction with its gen- esemblance in contour to the marine ng-trumpet of the middle ages, that ame of the instrument is doubtless though other derivations have been sted. In Germany, at the time when rumpet was extensively used in the hes, nuns often substituted the a marine, whence the name *Nonnen-* The instrument, whose tone was not iful, fell into disuse during the first f the 18th century.

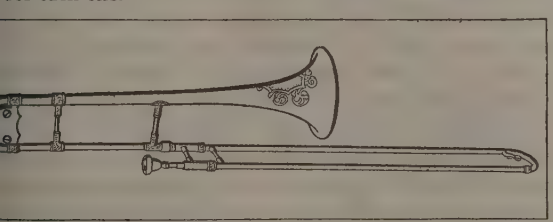


FROM GALPIN, "OLD MUSICAL INSTRUMENTS"

THE TROMBA MARINA, AN OBSOLETE STRING INSTRUMENT

ROMBONE, an important member he brass wind family of musical ments formerly known as sackbut . The trombone is characterized he slide, consisting of two parallel drical tubes, over which two other drical tubes, communicating at their extremities by means of a short ircular pipe, slips without loss r. The outer tube, therefore, slides the inner, thereby altering the total length of tube and odifying the pitch. When the slide is closed the instru- is at its highest pitch. To the upper end of one of the tubes is fastened the cup-shaped mouthpiece and to the end e other tube is fixed the bell-joint, on the proper proportions ich depend the acoustic properties of the instrument.

und is produced on the trombone, as on the horn, by means e lips stretched like a vibrating reed across the cup mouth- from rim to rim; the acoustic principles involved are the for both instruments. By overblowing, *i.e.*, by the varying on of the lips and pressure of breath, the harmonic series is ned, which is effective between the second and the tenth onics, the fundamental being but rarely of practical use. e are seven positions of the slide on the trombone, each giv- theoretical fundamental tone and its upper partials a semi- lower than the last, and corresponding to the seven shifts on iolin and to the seven positions on valve instruments. These positions, which give a complete chromatic compass of two es and a sixth, are found by drawing out the slide a little for each one.



OURTESY OF BOOSEY & CO., LONDON

TROMBONE, FORMERLY KNOWN AS THE SACKBUT, CHARACTERIZED TS SLIDING TUBES

he quality of tone varies greatly in the different instruments registers. The alto trombone has neither power nor richness ne, but sounds hard and has a timbre between that of a pet and a French horn. The tenor and bass have a full rich ty suitable for heroic, majestic music. The contra-bass trom- formerly little in request in the concert hall, is required for modern orchestral music.

sides the slide trombone, which is most largely used, there he valve trombones, and the double-slide trombones. The er in which the slide is replaced by three pistons permit more ant execution than the slide instruments, but their tone is ior. In the double-slide trombone the sliding branches are doubled and their length accordingly halved, thereby making the instrument more compact and lessening the length of the shifts, though demanding greater nicety in the adjustment of the slide.

The evolution of the trombone from the buccina is referred to in the article on the sackbut (*q.v.*), the name by which the earliest draw or slide trumpets, and subsequently the trombones, were known in England.

Of all wind instruments the trombone has perhaps been least modified in form; changes have occasionally been attempted, but for the most part with only trifling success. The application of ventils or pistons was made for the first time in 1818, in Germany, but instruments of this kind, though extensively used, have never superseded the original sliding type.

TROMP, the name of two famous Dutch admirals.

1. MARTIN HARPERTZOON TROMP (1597–1653) was born at Brielle, South Holland. At the age of eight he made a voyage to the East Indies in a merchantman, but was made prisoner and spent several years on board an English cruiser. On making his escape to Holland he entered the navy in 1624, and in 1637 was made lieutenant-admiral. In February 1639 he surprised, off the Flemish coast near Gravelines, a large Spanish fleet, which he completely destroyed, and in the following September he defeated the combined fleets of Spain and Portugal off the English coast—achievements which placed him in the first rank of Dutch naval commanders. On the outbreak of war with England Tromp appeared in the Downs in command of a large fleet and anchored off Dover. On the approach of Blake he weighed anchor and stood over towards France, but suddenly altered his course and bore down on the English fleet, which was much inferior to his in numbers. In the engagement which followed (May 19, 1652) he had rather the worst of it and drew off with the loss of two ships. In November he again appeared in command of eighty ships of war, and a convoy of 300 merchantmen, which he had undertaken to guard past the English coast. Blake resolved to attack him, and, the two fleets coming to close quarters near Dungeness on Nov. 30, the English, after severe losses, drew off in the darkness and anchored off Dover, retiring next day to the Downs, while Tromp anchored off Boulogne till the Dutch merchantmen had all passed beyond danger. The statement that he sailed up the Channel with a broom at his masthead in token of his ability to sweep the seas is probably mythical. In the following February (1653), while in charge of a large convoy of merchantmen, he maintained a running fight with the combined English fleets under Blake, Penn and Monk off Portland to the sands of Calais, and, though baffling to some extent the purposes of the English, had the worst of the encounter, losing nine ships of war and 30 or 40 merchantmen. On June 3, he fought an indecisive battle with the English fleet under Richard Dean in the Channel, but the arrival of reinforcements under Blake on the following day enabled the English to turn the scale against him and he retired to the Texel with the loss of seventeen ships. Greatly discouraged by the results of the battle, the Dutch sent commissioners to Cromwell to treat for peace, but the proposal was so coldly received that war was immediately renewed, Tromp again appearing in the Channel towards the end of July 1653. In the hotly contested conflict which followed with the English under Monk on the 29th Tromp was shot by a musket bullet through the heart. He was buried with great pomp at Delft, where there is a monument to his memory.

2. CORNELIUS VAN TROMP (1629–1691), the second son of the preceding, was born at Rotterdam on Sept. 9, 1629. At the age of 19 he commanded a small squadron charged to pursue the Barbary pirates. In 1652 and 1653 he served in Van Galen's fleet in the Mediterranean, and after the action with the English fleet off Leghorn on March 13, 1653, in which Van Galen was killed, Tromp was promoted to be rear-admiral. On July 13, 1665 his squadron was, by a hard stroke of ill-fortune, defeated by the English under the duke of York. In the following year Tromp served under De Ruyter, and on account of De Ruyter's complaints of his negligence in the action of Aug. 5, he was deprived of his command. He was, however, reinstated in 1673 by the stadtholder William, afterwards king of England, and in the actions of June 7, and 14, against the allied fleets of England and France, manifested a skill

and bravery which completely justified his reappointment. In 1675 he visited England, where he was received with honour by King Charles II. In the following year he was named lieutenant-admiral of the United Provinces. He died at Amsterdam, on May 29, 1691, shortly after he had been appointed to the command of a fleet against France. Like his father he was buried at Delft.

See H. de Jager, *Het Geslacht Tromp* (1883); and T. de Liefde, *Great Dutch Admirals* (trans. 1873).

TROMSÖ, a seaport of Norway, capital of the *amt* (county) and *stift* (diocese) of the same name on the north-western coast. Pop. (1927) 11,241. It stands on an islet between Kvalö and the mainland. The town has fish oil factories, tanneries, and makes boots and shoes; also boats for the fishing and whaling. The buildings, many of wood, include the town hall and a museum. Sealskins and other furs, dried and smoked fish, and whale and seal oil, are exported, and the herring fishery is very productive.

TRONDHJEM (trönd'yĕm) or Throndhjem, a city and seaport of Norway; chief town of the diocese of Trondhjem and the county of South Trondhjem, 384 m. by rail N. of Oslo. Pop. (1927) 55,716. It lies on the Trondhjem fjord on a peninsula between the fjord and the River Nid. The houses are principally of wood. The principal building is the cathedral, dating in part from the close of the 11th century, but chiefly of the 12th and 13th centuries. It suffered from repeated fires, chiefly in the 17th century but was restored and is now the finest church in Norway and the scene of the coronation of the Norwegian sovereigns. The port has regular communication with all the Norwegian coast towns; also Hull, Newcastle, Hamburg, etc., and trades in timber, wood pulp, oil, fish, copper, etc. The industries include shipbuilding, fish-curing, and there are saw-mills and machine shops.

Trondhjem, originally Nidaros, to which name it reverted as from January, 1930, was founded by Olaf Tryggvason, who built a royal residence and a church here in 996. It was made an archbishopric in 1152, and was the capital until 1380. The city attained its highest development about the latter half of the 13th century, by which time it had become an important pilgrimage centre and had 15 churches. It sustained frequent sieges. Its importance declined about the time of the Reformation, but during the present century, as a port with modern facilities and a considerable trade, it has grown rapidly. Since 1921 it has been connected with Oslo by the Dovre railway.

TROON, municipal burgh, seaport and watering-place of Ayrshire, Scotland. Pop. (1921) 9,474. It is situated 6 m. N. by W. of Ayr, and 35 m. S.W. of Glasgow by the L.M.S. railway. It has a fine natural harbour with a breakwater 3,000 ft. long, and two graving docks. Shipbuilding is the leading industry, coal the chief export, and iron the chief import.

TROPHY (Gr. *τρόπαιον*), a memorial of victory set up on the field of battle at the spot where the enemy had been routed. It consisted of captured arms and standards hung upon a tree (preferably an olive or an oak) and booty heaped up at its foot, dedicated to the god to whom the victory was attributed. If no suitable tree was at hand, a lopped trunk was fixed in the ground on an eminence. The tree or trunk bore an inscription containing the names of the god and the combatants, a list of the booty and the chief incidents of the battle. In the case of a naval victory the trophy, composed of the beaks of ships, was set up on the nearest beach and consecrated to Poseidon. It was regarded as a sacrilege to destroy a trophy, since it was dedicated to a god.

To facilitate reconciliation with their conquered foes, neither the Macedonians nor the Romans in early times erected such trophies. The Romans showed a preference for setting up the memorials of victory in Rome rather than on the field of battle: such were the trophies of Marius recording his victories over Jugurtha and the Cimbri and Teutones. In imperial times their place was taken by columns or triumphal arches (*see* ROME: *Archaeology*).

TROPICAL AGRICULTURE. Modern industry receives from tropical regions two-thirds of the sugar entering international trade. From the tropics come the world's bananas, pineapples, dates, vegetable oils; the indispensable beverage materials, coffee, cacao, and tea; sisal and henequen, and related fibres, abaca, jute, kapok; quinine, camphor, and other medicinal ma rials; dyes, and tannins. Numerous other products extensiv used in the tropics may yet become better known in northe countries, such as the cassava (manioc, yuca, tapioca), plantai yams, taro, dasheens, and other root crops; palm sugar, the b erages maté and kola; and the valuable fruits, avocado, man papaya, durian, mangosteen, etc.

Table Showing Production of Some Important Tropical Crops

	World Production	
Sugar	(Season 1927–28)	25,326,935 long tons
Coffee	(Year 1928)	36,095,000 bags of 60 kilo
Tea	(„ 1927)	3,955,000 metric quintal
Cacao	(„ 1928)	505,281 „ tons
Crude rubber	(„ 1928)	653,833 long tons
Rice	(„ 1928)	854,486,000 metric quintal
Sisal	(„ 1928)	239,000 tons

Many important crops which originated in the tropics are n extensively cultivated in temperate and sub-tropical zones. Amo these are oranges and other citrus fruits, cotton, maize, melo beans, sweet potatoes, and tobacco. There are still hundreds little known species of fruits, nuts, oil plants, gums, and fib awaiting development.

Forest products are among the oldest known tropical expo The tropics have long been the source of the world's preci cabinet woods, such as mahogany, Spanish cedar, rosewood, sa wood, and many others. They have provided many useful fo by-products, chief among which are rubber, balata, and gut percha essential for cable insulation, chicle, and other gums. wide has been the demand for tropical forest products that world no longer depends wholly for its supply on the wild fore but now produces rubber, mahogany, and other forest mater from plantations, often grown in association with food crops.

When compared with farming methods in North America Europe, tropical agriculture is characterized by the employm of much hand labour, using crude, simple tools, and by a v limited use of labour-saving implements. The production capita is small and the standards of living low. As a result, most tropical countries native methods of tilling the soil are tremely primitive. The land is often in communal or tribal own ship and agriculture becomes a shifting, nomadic procedure, which patches of forest are cut and burned and a mixture crops planted. At the end of a few years the land is abando and another patch cleared and cultivated.

Within the last century plantation or estate systems have b introduced by Europeans and Americans for the production export crops of sugar, rubber, coffee, fruits, and fibres, un modern scientific methods, with native labour and white mana ment. Conspicuous in this field are the sugar plantations of Ja Hawaii, Cuba, and Porto Rico; the rubber estates of Java Sumatra, Malaya, and Ceylon; the banana industry of the Ca bean region, where one company alone cultivates 450,000 ac of land in six or eight countries, operates 1,600 m. of railroads a large fleet of ships, has two sugar mills and a refinery, and ma tains a chain of excellent hospitals and a research division w scientific laboratories and experimental fields.

Under the leadership of scientific methods, a revolution in tr ical agriculture is in progress. Great changes are being wrou Enormous improvements have been achieved by breeding varie of plants and live stock and by the culture of crops and the curi processing, preservation and shipment of tropical products. periment stations are maintained in almost every country. Nota instances of the latter are found in Java, Sumatra, and Haw Tropical industries attain success in the proportion that they e ploy and liberally support scientific research. Thus, the Dutch Java have originated disease-resistant sugar canes with hig sugar content; they have improved cinchona and transplan quinine production from the Andean countries, and are now p ducing a better palm oil than Africa. Rubber, in like manner, been taken from the Amazon to the Orient.

It has been predicted that northern countries will eventua be unable to produce sufficient food for their increasing popu tion and that the tropics will supply this deficiency. The imp tance of the rôle the tropics are destined to play in this product

dstuffs for the northern races is a complex and still unset-roblem. Among the factors are the vast areas of unde-d land in tropical America, Africa, and portions of the East (Borneo, New Guinea, Sumatra); the tendency of the people to multiply as health conditions improve; the in-g importation of northern foodstuffs into tropical coun- and the disinclination of northern races to change their abits and to consume tropical vegetables, fruits, and cereals. he other hand, the tropics can be depended upon to supply rld with all its prospective needs of rubber, sugar, vege-oils, beverages, hard fibres, spices, and similar tropical dities. In fact, these can be grown on a relatively limited nd their culture can not be greatly extended without glut-arkets and depressing prices below the cost of production. sult the articles on RUBBER, SUGAR, COFFEE, RICE, TEA, etc., INDIA, BRAZIL, EAST INDIES, WEST INDIES, CEYLON, etc. O. W. Barrett, *The Tropical Crops;* J. C. Willis, *Agriculture in opics.* (W. A. OR.)

OPICAL MEDICINE. As medicine advances from the of an art to that of a science, so do the bounds which cate tropical medicine become more faint. Few major es are restricted to the lower latitudes, and tropical medi-s here considered, embraces all those maladies which, for reason, prevail especially in the tropics, though not neces-limited thereto. Some diseases lightly regarded to-day as ially tropical are merely commensurate with a primitive of civilization, and consequent unhygienic conditions. Bu-plague smouldered in England for centuries, every few years up to epidemic degree, and ceased as an endemic infection bout 1679. Cholera was common enough in John Wesley's demand a paragraph in his little volume on household ies. The Londoner of Charles II.'s time could enjoy a jest *dibras* unintelligible to anyone not familiar with the stages alaria paroxysm.

present stimulus to the special study of tropical medicine from the spread of commerce from causes far back in his-nd from the ever-growing complexity of modern conditions.

cial Problems of Tropical Medicine.—Liability to con-disease in the tropics is not due in the main to inherent e in the individual, but to circumstances generally favour-uxuriance of animal life. The causative organisms of some es, *e.g.*, malaria and yellow fever, depend for their propaga-n insects most numerous and active in tropical conditions; h and humidity are essential for the development of hook-larvae in the soil; and in such surroundings bacterial life eral flourishes most abundantly. Though exceptions to these spring to the mind—typhus fever, a louse-borne disease, s its maximum range under cold weather conditions, and ctors governing the transmission of common colds and determine the spread of pneumonic plague. The newcomer tropics is faced by all these potential dangers.

ventive medicine has done him one great disservice. Born -hygiene times, he would almost certainly have acquired a l immunity to a variety of diseases which nowadays in his ountry he escapes, but to which the native, surviving child-is relatively immune. This resistance to disease, previously ed a racial characteristic, is now generally considered a per-immunity gained by the individual during early life. As s this aspect of malaria in natives, Christopherson has that in hyper-endemic areas children pass through a period te infestation lasting for about two years. During this time estations of the disease are practically continuous. A stage nune infestation is then reached which lasts through child-nto adult life. Whatever the nature of the immunity it is nt to enable adults, under conditions that lead to intense on in the child, to live infected but without suffering iably from sickness due to malaria.

northern sojourner in the tropics may complicate the ms of tropical medicine, already sufficiently involved, by villingness to adapt his regimen and habits to new surround-Therefore, physiological changes, including alterations in nctioning of the endocrine glands, may result, with a consequent train of morbid symptoms. Native customs and modes of life evolved by the empiricism of years, may repay study. A temporary adoption of the Indian fashion of wearing the shirt outside the trousers has in practice averted the threatened onset of heat stroke. The early inhabitants of Northern Africa cooled their houses by structural devices which modern architects might copy and adapt to the needs of European residents.

Methods of Tropical Medicine.—Accurate diagnosis is essential to the correct treatment of any disease; this is no new knowledge—"as sayeth the prince of physic Avicenna: 'How shouldest thou hele a sore and not yknow the cause?'" The aim of modern medicine is to prevent rather than to cure, and in like manner a close study of causation is a requisite preliminary to wise and successful prevention. Therefore a basic knowledge of bacteriology, entomology and other branches of medical parasitology is a necessary part of the training prescribed for students of tropical medicine. Not every species of *Anopheles* can be infected with malaria, nor are the breeding habits of all the malaria-carrying anophelines the same. A system of drainage which eradicates malaria in one locality may have no effect in another, and actually may intensify the disease in a third. Slight changes in the chemical reactions of water may prevent mosquito breeding, a discovery likely to have far-reaching results in malaria prevention. And thus the importance of these ancillary sciences to tropical medicine becomes more obvious every day.

Further, statistical data, when investigated and scrutinized by exact methods and correlated with clinical observations, may yield valuable information regarding the nature and origin of disease. If a malady is found to be periodic, the climatic and physical changes associated with the rise and fall of the infection may indicate the causal agents, and when their identity is established effective measures may be taken against them. Rogers' researches show that cholera begins to spread only when the degree of atmospheric humidity has reached a certain figure; in consequence, the possible commencement of an epidemic can be foreseen and appropriate prophylactic measures undertaken in advance. Already tropical research has achieved great triumphs, and when the true economy of preventive medicine is realized more fully in tropical administration, the return in increased efficiency will multiply.

Results.—Before the last decade of the 19th century, the agent responsible for the spread of malaria (*q.v.*) was unknown. No eye had seen the bacillus of plague; and fleas were thought merely unpleasant creatures, rather less scandalous than lice. Yellow fever mosquitoes besported themselves unheeded, except in so far as they might disturb an afternoon's siesta. But when Patrick Manson argued that some biting insect serves as intervenient host for the nematode parasite of man, *Filaria bancrofti*, and turned his theory into proven fact, he stood like Cortez on a peak in Darien, viewing a new world. Following on Manson's example and advice, and faced by difficulties which would have disheartened most, Ross carried out his laborious researches and finally *Anopheles* was incriminated as the vector of malaria.

In the old yellow fever (*q.v.*) days, a king's ship, the *Tiger* cruised off Barbados, and out of a complement of 220, buried 600 men dead of yellow fever within two years; the commander, as he reported, "still pressing men out of the merchant ships that came in, to recruit his number in the room of those that died daily." The heroic work of Reed and his collaborators proved that this infection is transmitted through the bite of a mosquito, *Aëdes argenteus* (*Stegomyia fasciata*), and Noguchi's indication of a causative micro-organism apparently confirmed their work. Fortunately the peculiar breeding habits of the insect vector render it relatively easy to control, and in the West Indies to-day yellow fever is little more dreaded than in England.

Ankylostomiasis (hookworm) (*q.v.*), which reduced the vitality and lowered the efficiency of millions of people, has been laboriously investigated. Firm, constant, but inexpensive measures of sanitation prevent infection, and recent close study of the free-living stages of the worm points to still more effective methods of control. Schistosomiasis yields to the antimony treatment elaborated by Christopherson, and the labours of Miyairi and Suzuki and Leiper, showed that the parasites develop in water snails

vulnerable to attack.

Prior to recognition of the curative properties of intra-venous antimony, kala azar (*q.v.*), which decimates rich populous tracts of Bengal and Assam, killed over 90% of those attacked. The disease is in process of investigation by a special commission, and the mode of transmission, so far baffling identification, is likely to be revealed. If the active agent proves to be a species of "sand-fly," as has been surmised, the success of the hygienic methods adopted in practice will be explained.

The progress of physiological knowledge in the special branch of endocrinology has secured success in the treatment of cases of sprue (*q.v.*), where the restoration of the calcium content of the blood has been effected by the administration of parathyroid extract.

Cholera and plague may be stayed by prophylactic vaccines, and the results of anti-typhoid inoculation were one of the medical triumphs of the World War. The incidence of tropical liver abscess has been enormously reduced by the use of emetine, and the special "liver-abscess-days"—earmarked for surgical operations—once a feature of some tropical hospitals, are now a thing of the past. Synthetic chemistry adds to the resources of the scientific physician of tropical diseases; "Bayer 205" and tryparsamide in the treatment of African sleeping sickness have given hopeful results, while new antimony compounds are replacing tartar emetic for intravenous medication, seemingly with all its advantages and none of its drawbacks. Thus the diseases which take so heavy a toll of human life are one by one yielding to science and coming under control, and the outlook to-day is brighter than even the most optimistic would have dared to prophesy some thirty years ago. In honouring the men who thus have extended the science of medicine, we should not forget those of old time who caught glimpses of truth, often through a glass darkly, but at times with a clearer vision.

Problems of the Future.—Even should science succeed in finding a cure for every tropical disease, still other problems await solution. Can the individual be protected and enabled to work as efficiently as in a temperate zone? Can impairment of his vitality and nervous energy be prevented and normal health and longevity secured? Whether or not the tropics can be made a safe home for white settlers depends largely on the extent to which local administration will initiate and maintain effective and scientific systems of sanitation, and will educate the indigenous population into ways of cleanliness and order. Panama sanitary methods, dependent on abundant capital and a soldierly precision of enforcement, are possible only in limited and specially favoured areas. And in certain tropical localities it is notorious that the practice of sanitary law bears little relationship to the excellence of the principles embodied in the statute-book.

When all these difficulties have been faced and overcome, and the life of white settlers modified in matters of housing, diet, work and play to meet their altered physical environment, there remains the great question: Can a white race settle permanently in a tropical country and after several generations still retain its original stamina and mental vigour? In spite of thousands of years of colonization this question still awaits a final answer. Heretofore the results of disease—chronic malaria and ankylostomiasis stunting body and mind—moral decay, consequent on association with lower or even debased native modes of life, have been confused inextricably with the effects of climate.

The unfavourable factor in tropical climates has been variously identified as the heat, or light, rays of the sun, the depressing monotony of an equable temperature, or a high relative humidity; the last admittedly trying, and affecting both comfort and efficiency. Even so, the individual can be trained to withstand a degree of temperature intolerable before acclimatisation, but whether continued exposure to such temperatures results in some subtle change in the nervous system, with loss of vigour and driving power, is a matter of dispute. Whatever the responsible agency, certainly some diminution in vitality commonly occurs, as is evidenced by the accepted practice of granting home leave to government servants and to staffs of business concerns, and this from no motives of philanthropy but because it pays.

TROPICAL REVOLVING STORMS, a generic term meteorology, used for those disturbances of the general circ tion of the atmosphere where the winds, often of destruc violence, are characterized by a combined circular and cen ugal movement. Such revolving storms have received a var of names in different parts of the world. (*See* CYCLONE; HU CANE; TORNADO and TYPHOON.) Many descriptions and ex nations of them have been given. For comprehensive, regio arranged bibliography *see* Shaw and Austen, *Manual of Met ology* (1926).

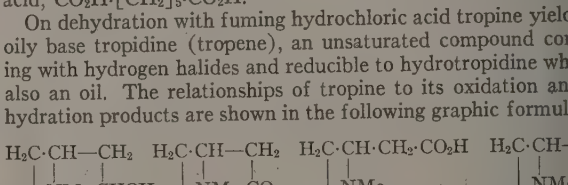
TROPIC-BIRD, a genus (*Phaethon*) of sea-birds of order Steganopodes with webbed feet and long forked tails. flight is by rapid strokes of the wing. The yellow-billed tropic (*P. flavirastris*) has the widest range, inhabiting the Atla Indian and Pacific oceans, and breeding on trees in various isla including the Bermudas. It lays a single pinkish-white egg, tled with brownish-purple. The plumage is white, with b patches. *P. aethereus* is larger and lacks the yellow bill. It not occur in the western part of the Indian ocean. *P. rubric* is still larger and has a red tail and a roseate tinge to the re the plumage. It is confined to the Pacific and Indian oceans. tropic-birds form the family *Phaethonidae*.

TROPINE (Tropanol), one of the simpler chemical proc into which the poisonous alkaloid atropine (*q.v.*) is converte the action of acids or alkalis. Tropine is also poisonous bu longer retains the property of dilating the pupil of the eye crystallises in colourless plates melting at 63° C and boilin 229° C. It is very hygroscopic and readily soluble in water. I strongly basic substance forming crystalline salts with When warmed with sodium in amyl alcoholic solution, tropi transformed into a stereoisomeride, melting at 108° C, and b at 240° C, identical with the pseudo-tropine (ψ-tropine) obt from the alkaloid tropa-cocaine with hydrochloric acid.

The chemical constitution of tropine, $C_8H_{15}ON$, is reveale the following reactions. With chromic acid it is oxidised su sively to tropinone and tropinic acid.

Tropinone (Tropanone) has been synthesised from succi dehyde, calcium acetonedicarboxylate and methylamine (R. inson, 1917), whereas tropinic acid by exhaustive methylatio nishes an unsaturated dicarboxylic acid reducible to *n*-pi acid, $CO_2H{\cdot}[CH_2]_5{\cdot}CO_2H$.

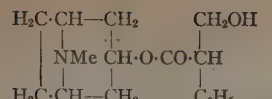
On dehydration with fuming hydrochloric acid tropine yiel oily base tropidine (tropene), an unsaturated compound co ing with hydrogen halides and reducible to hydrotropidine wh also an oil. The relationships of tropine to its oxidation an hydration products are shown in the following graphic formul



Tropic Acid, $C_6H_5{\cdot}CH(CH_2{\cdot}OH){\cdot}CO_2H$, the other decon tion product of atropine, is a hydroxy-acid readily convert dehydrating agents into atropic acid, $C_6H_5{\cdot}C(CO_2H){:}CH_2$, has been synthesised from acetophenone (hypnone) by the f ing series of reactions:—

$$C_6H_5{\cdot}CO{\cdot}CH_3 \xrightarrow{PCl_5} C_6H_5.C\ Cl{:}CH_2 \xrightarrow{KCN}$$
$$C_6H_5{\cdot}C(CN){:}CH_2 \xrightarrow{H_2O} C_6H_5{\cdot}C(CO_2H){:}CH_2$$

Tropine and tropic acid combine to form a salt, tropine tr losing water to yield atropine which may therefore be repre by the following formula:—



Atropine

)ther organic acids can take the place of tropic acid in this densation with tropine, and the products, the acyltropines, are ned *tropeines*. Certain of these possess the mydriatic action ibited by atropine. (G. T. M.)

TROPISMS, forced movements of an organism (or of a e part of an organism) in response to external stimuli which ig about obligatory physiological reactions which are related to direction in which the stimulus reaches the organism. A good stration is the familiar phenomenon of plants turning to the , which De Candolle called heliotropism (1835). It is now wn to have its counterpart in some animals. The tropistic de of behaviour includes positive and negative thermotropism, ards or away from a source of heat; positive and negative tropism, towards or away from the direction of a gravitational ulus; galvanotropism, towards or away from electrical iations, chemotropism, in relation to chemical reagents; rheo- ism, in relation to currents, and so forth. The essential char- eristics of tropisms are their relation to the direction of the ulus, and their obligatoriness. The young eel or elver is not ng to swim up-stream; it is physiologically forced to keep dead inst the current. The physiological constitution of its body is h that it automatically adjusts itself towards securing equal ssure-stimulation on its two sides. The clarifying of the con- t of tropisms is mainly due to Jacques Loeb, and part of his nition may be quoted. "These tropisms are identical for mals and plants. The explanation of them depends first upon specific irritability of certain elements of the body surface, second, upon the relations of symmetry of the body. Sym- rical elements at the surface of the body have the same tability; unsymmetrical elements have a different irritability. se nearer the oral pole possess an irritability greater than that hose near the aboral pole. These circumstances force an animal rient itself towards a source of stimulation in such a way that mmetrical points on the surface of the body are stimulated ally. In this way the animals are led without will of their own er toward the source of stimulus or away from it." While rained tropisms are eventually quite involuntary or forced ctions to external stimuli, it does not follow that there was no chical factor in their racial evolution. Care must be taken not xaggerate the rôle of "pure tropisms"; and one may even ask here are any. A noteworthy fact is the reversibility of many isms, for the same animal may show a positive or a negative ction to temperature, light, gravity or an electric current, the ction varying according to (*a*) the strength of the stimulation, the internal physiological state, and (*c*) the coincident in- nce of the other factors. (*See* PSYCHOLOGY, COMPARATIVE.)

TROPPAU: *see* OPAVA.

TROPPAU, CONGRESS OF, a conference of the allied ereigns or their representatives to discuss a concerted policy n regard to the questions raised by the revolution in Naples of 1820. At this congress, which met on Oct. 20, 1820, the peror Alexander I. of Russia and Francis I. of Austria were sent in person; King Frederick William III. of Prussia was resented by the crown prince (afterwards Frederick William). The three eastern powers were further represented by the isters responsible for their foreign policy: Austria by Prince tternich, Russia by Count Capo d'Istria, Prussia by Prince rdenberg. Great Britain, on the other hand, which objected on nciple to the suggested concerted action against the Neapolitan erals, sent no plenipotentiary, but was represented by Lord wart, ambassador in Vienna. France, too, had given no plenary vers to her representatives.

n a series of conferences—to which the representatives of Great Britain and France were not admitted, on the excuse that they were only empowered to "report," not to "decide"—was drawn up the famous preliminary protocol signed by Austria, Russia and Prussia on Nov. 19. The main pronouncement of the "Troppau protocol" is as follows: "States which have undergone a change of government due to revolution, the results of which threaten other States, *ipso facto* cease to be members of the European Alliance, and remain excluded from it until their situation gives guarantees for legal order and stability. If, owing to such alterations, immediate danger threatens other States the powers bind themselves, by peaceful means, or if need be, by arms, to bring back the guilty State into the Great Alliance.

No effort was made by the powers to give immediate effect to the principles enunciated in the protocol; and after its promulgation the conferences were adjourned, it being decided to resume them at Laibach in the following January (*see* LAIBACH, CONGRESS OF).

TROSSACHS, THE (Gaelic, "the bristled country," a crude allusion to its physical features), a defile in the south-west of Perthshire, Scotland. It is a narrow, beautifully wooded glen, of no great depth, extending from Loch Achray to Loch Katrine, and continued thence by a strip on the north-eastern shore to a point above the now submerged Silver Strand opposite to Ellen's Isle—a total distance of 2½ m. It is situated 8 m. W. of Callander and 5 m. N. of Aberfoyle, between the steep green slopes of Ben Venue (2,393 ft.) on the south-west and the precipitous craigs of Ben A'an (1,750 ft.) on the north-east. The region has been famous for its beautiful scenery since the appearance of Sir Walter Scott's *The Lady of the Lake* and *Rob Roy* with their vivid descriptive passages.

TROTSK (Gatchina), a town in the Leningrad Area of the Russian S.F.S.R., in 59° 33′ N., 30° 7′ E., situated among the lakes and pine forests on the banks of the Izhora river. It was originally a Swedish estate presented by Peter I. to his sister. Catherine II. gave it to Prince Orlov, and a castle and grounds were constructed by the Italian architect, Rinaldi, in 1770. Later it became a military camp, and, towards the end of the 18th century, a summer residence of the tsars. Near the palace is the priory built by Lvov in 1797 for the Knights of Malta, of which order Paul I. was Grand Master. In the civil wars following 1917, Gatchina was used as a base by Kornilov and Kerensky in 1917, and Yudenich in 1919. In 1923 it was re-named after Trotsky.

See *Guide to the Soviet Union* (Moscow, 1925) in English.

TROTSKY, LEV DAVIDOVICH (1879–), Russian politician, whose real name was Bronstein, was born near Elizavetgrad, the son of middle-class Jews. He was educated at the Peter and Paul *Real Schule* in Odessa and at the university of that town. He was arrested as a revolutionary in 1898, and soon after exiled to Eastern Siberia. In 1902 he escaped to England by means of a forged passport in the name of Trotsky (which name he used thenceforward). In London, despite his youth, he soon became an important member of the small body of social democrats which included Plekhanov and Lenin. He collaborated with the latter and others in the publication of *Iskra* (Spark), the most famous of the Russian revolutionary newspapers. In 1905 he returned to Russia, was elected a member of the St. Petersburg Soviet of Workers' Deputies and was chairman of the meeting at which the whole Soviet was arrested. He was exiled to Tobolsk but escaped immediately on his arrival in Siberia and went to Vienna, where he worked for the *Arbeiter Zeitung* and the *Pravda*. He also worked in a chemical factory. In 1910 he attended the Social Democratic congress at Copenhagen, defending a position of his own, midway between that of the Bolsheviks and that of the Mensheviks. In 1913 he was in Constantinople as a war correspondent. The following year found him in Zurich and Paris, taking part in the publication of a revolutionary paper. He wrote a book on the origins of the World War, published in German, and was sentenced to eight months'

imprisonment. But he opposed the War not only in Germany but in the Allied countries, and in 1916 was expelled from France. He was arrested by the Spanish authorities on crossing their frontier but was allowed to leave for America, where he edited the Russian revolutionary *Novy Mir* (The New World).

When the revolution broke out in March 1917 Trotsky's friends and subscribers to the paper collected the money for his journey to Russia. He was, however, arrested by the British authorities and taken ashore at Halifax, where he was interned until the Russian Provisional government asked for his release. He arrived in Petrograd soon after Lenin. He was the leader of a small party of social democrats and soon joined the Bolsheviks but did not actually become a member of the Bolshevik party until July 1917, when he was arrested for being concerned in the rising which took place in that month. He played a part hardly less important than that of Lenin in organizing the Bolshevik revolution in 1917 and became People's Commissar for foreign affairs in the new Soviet Government.

Trotsky was the most important figure in the Russian delegation during the negotiation of the Brest-Litovsk peace treaty. Believing that the moral effect of the revolution had already been such that the Germans would be unable to force their troops to move against Russia, he met the oppressive German demands with the statement that Russia would not sign a treaty on such terms but that she considered the War to be at an end and would demobilize her troops. The Germans thereupon continued their advance. Lenin had disagreed with Trotsky, considering that the risk was too great since at that time the Germans could easily have taken Petrograd. After a series of debates, Trotsky announced that he now sided with Lenin and by a majority of one it was decided to sign an even more unfavourable treaty than that previously refused. Trotsky was replaced by Chicherin as Commissar for foreign affairs and took over the Commissariat of war. In spite of opposition he made great use of officers of the old régime in organizing a new Red army. The results obtained were used to justify the employment of "bourgeois" technical experts in the factories. When he had made a new army that showed itself superior to those of the Whites his energies were used in preventing the complete collapse of the railways. In 1920 he organized as "labour armies" the troops that were not needed for war.

Until the introduction of the new economic policy Trotsky urged industrial conscription, but wholeheartedly accepted the new policy which made such measures impossible. During the Polish war of 1920, he opposed the disastrous advance on Warsaw but was overruled by Lenin. In the autumn of 1923 he adopted a position that made it possible for the "old guard" of the Communist leaders to accuse him of canvassing for the support of the younger men. He was violently attacked by Stalin, Zinoviev and others. Many of his friends were shifted from their posts and he himself was on the way to the Caucasus to take a cure, when Lenin died. Throughout the revolution the names of Lenin and Trotsky had been coupled and the death of the one seemed to leave the other alone in the field. This was not really so. Seniority counts for much in the Communist party and the older leaders never forgot that Trotsky had only joined the party in 1917. The campaign to discredit him was continued. He lost his post as Commissar of war. When he returned from the Caucasus he was given work of small political significance, being made head of the committee for the development of electric power in Russia. In 1925 he resigned from this post and was made head of the Central Committee for Concessions. In Nov. 1927 he was expelled from the Communist party for his anti-party activities, and in Jan. 1928 he was exiled to Viernie in Turkestan. He was subsequently banished and went to Constantinople (1929).

Trotsky was, after Lenin, the most brilliant of the revolutionary leaders. He wrote a number of books on the history of the revolution, on Lenin, on the civil war and on the relations between revolution and literature, besides essays on questions of the day. For this *Encyclopædia* Trotsky wrote the biography of Lenin. (A. Ra.)

Works in English: *Defence of Terrorism* (1920); *The Lessons of October* (1925); *Lenin* (1924); *Where Is Britain Going?* (1926 American edition *Whither England?* (1925); *Towards Socialism Capitalism?* (1926); *Problems of Life* (1924); *Literature and Revol tion* (1925).

TROTZENDORFF (or Trocedorffus), **VALENTI FRIEDLAND** (1490–1556), German educationist, called Tro zendorff from his birthplace, near Görlitz, in Prussian Silesia, w born on Feb. 14, 1490, of parents so poor that they could n keep him at school. Nevertheless he was sent to study at Gö litz, and became a schoolmaster there. He resigned presently study under Luther and Melanchthon, supporting himself mea while by private teaching. He then became master in the scho at Goldberg in Silesia, and in 1524 rector. There he remain three years, when he was sent to Liegnitz. He returned to Gol berg in 1531 and began that career which has made him the typ cal German schoolmaster of the Reformation period. He ma his best elder scholars the teachers of the younger classes, a insisted that the way to learn was to teach. He organized t school in such a way that the whole ordinary discipline was the hands of the boys themselves. Every month a "consu twelve "senators" and two "censors" were chosen from the pupi and over all Trotzendorff ruled as "dictator perpetuus." O hour a day was spent in going over the lessons of the previo day. The lessons were repeatedly recalled by examinations, whi were conducted on the plan of academical disputations. Eve week each pupil had to write two "exercitia styli," one in pro and the other in verse, and Trotzendorff took pains to see th the subject of each exercise was something interesting. The fa of the Goldberg School extended over all Protestant Germar and a large number of the more famous men of the followi generation were taught by Trotzendorff. He died on April 1556.

See Herrmann, *Merkwürdige Lebensgeschichte eines berühm Schulmanns, V. F. Trotzendorffs* (1727); Frosch, *V. F. Trotzendo Rektor zu Goldberg* (1818); Pinzger, *V. F. Trotzendorff* (with Goldberg portrait, and a complete list of his writings, 1825); Koehl *V. F. Trotzendorff, ein biographischer Versuch* (1848); G. Bau *Valentin Trozendorf und die Goldberger Schule* (1921). The b graphical facts appear to be derived from a funeral or memo oration delivered by Balthasar Rhau in the university of Wittenb on Aug. 15, 1564, and published in an edition of Trotzendor *Rosarium* (1565).

TROUBADOUR, the name given to the poets of southe France and of northern Spain and Italy who wrote in the *lang d'oc* from the 12th to the 14th centuries. In Provençal the wo is spelt *trobaire* or *trovador,* and is derived from the verb *trob* to find, or to invent (Fr. *trouver*). The troubadour was one w invented, and originally improvised, poetry, who "found out" n and striking stanzaic forms for the elaborate lyrics he compos

The earliest troubadour of whom anything definite is known Guilhem IX. (b. 1071), count of Poitiers and duke of Aquitai whose career was typical of that of his whole class, for "he kn well how to sing and make verses, and for a long time he roam all through the land to deceive the ladies." The high rank of t founder of the tradition was typical of its continuation; by the largest number of the troubadours belonged to the noble cla while no fewer than 23 of their number were reigning princ Among them is a king of England, Richard I., who is believ to have written in *langue d'oil* as well as in *langue d'oc,* and w has left at least one canzo, that written in prison, of remarka beauty. These noble troubadours were distinguished by th wealth and independence from those who made their song th profession, and who wandered from castle to castle and fr bower to bower. But whether dependent or independent, poets exercised a social influence paralleled by nothing before in the history of mediaeval poetry. They had great privileges speech and censure, they entered into questions of politics, a above all they created around the ladies of the court an atm phere of cultivation and amenity which nothing had hithe approached. The troubadour was occasionally accompanied by apprentice or servant, called a *joglar,* who provided a musi setting for the poet's words, and sometimes sang the songs.

There were recognized about 400 troubadours, during the wh period in which they flourished, from Guilhem de Poitiers do

Guiraut Riquier (*c.* 1230–94). Several ms. collections of graphies have been preserved, and from these we gain some a of the careers of no fewer than 111 of the poets. The ncipal source of the lives of the troubadours is a collection, various hands, made towards the middle of the 13th century. these Uc of Saint Cyr (*c.* 1200–40), himself a troubadour, s certainly one of the authors. Another, but unreliable, source nformation is the *Vies des plus célèbres et anciens poètes pro-caux,* published by Jehan de Notredame or Nostradamus, in 5. Even the numerous genuine biographies are often em-idered with fantastic and whimsical statements which make evere demand upon the credulity of a modern reader. One troubadour, Rambaud of Orange, left a commentary on his n poems, and Guiraut Riquier one on those of a fellow trouba-r, Guiraut of Calanson (1280). This proves the poetry of vence to have passed early into the critical stage, and to have n treated very seriously by those who were proficient in it. s is further shown by the respect with which the Provençal ts are mentioned by Dante, Petrarch and others.

The verse form most frequently employed by the troubadours the *sirventés*, a term which is earliest met with in the second f of the 12th century. The troubadours also employed the *lada*, which was a song with a long refrain, not much like the nal ballade of the north of France; the *pastourella;* and the a. This last took its name from the circumstance that the rd *alba* (dawn) was repeated in each stanza. This was a rning-song, as the *serena*, a later invention, was an evensong. *planh* was a funeral elegy, composed by the troubadour for obsequies of his protector, or for those of the lady of his otion. Most interesting of all, perhaps, was the *tenson*, ch was a lyrical dialogue between two persons, who discussed t, as a rule, some point of amorous casuistry, but sometimes tters of a religious, metaphysical or satirical nature. The ubadours were essentially lyrical (*see* PROVENÇAL LITERATURE).

The biographies of the troubadours, which throw an unpar-lled light upon mediaeval literary life, may perhaps be most veniently treated in connection with the courts at which each up of them flourished. It is in Poitou that we trace them first, re Guilhem, count of Poitiers, who reigned from 1087 to 1127, both the earliest patron and the earliest poet of the school. daughter of Guilhem X. carried on her grandfather's tradi-n. This was Eleanor of Aquitaine, at whose court Bernart of ntadour rose to eminence. This poet seems to have been the of a kitchen-scullion in the castle of Eble II., viscount of ntadour. Eble, himself a poet, was early impressed by the nts of his serving-boy, and trained him to be a poet. The utiful wife of Eble, the viscountess Agnes of Montluçon, ouraged the suit of the youthful Bernart; indeed, they had retly loved one another from their childhood. The poems which passion inspired are among the most admirable lyrics which e come down to us from the middle ages. The husband at discovered the intrigue and exiled Bernart from Ventadour. troubadour took shelter with Eleanor of Aquitaine, who ame in 1152 the queen-consort of Henry II. of England, him-a protector of poets.

Henry, eldest son of Henry II., was the patron of another nent troubadour, Bertran de Born, viscount of Hautefort in igord. Dante saw Bertran de Born in hell, carrying his severed d before him like a lantern, and compared him with Achito-l, who excited the sons of David against their father. This erred to the subtle intrigues by which the troubadour had rked on the jealousy existing between the three sons of the g of England. The death of Prince Henry (1183) produced m Bertran de Born two *planhs*, which are among the most cere and beautiful works in Provençal literature. The poet was nediately afterwards besieged in his castle of Hautefort by hard Cœur de Lion, to whom he became reconciled and whom accompanied to Palestine. He grew devout in his old age, and d about 1205.

There were poetesses in the highly refined society of Provençe, l of these by far the most eminent was Beatrix, countess of , whose career was inextricably interwoven with that of an-other noble troubadour, Rambaut III., count of Orange, who held his court at Courthézon, a few miles south of Orange. Rambaut said that since Adam ate the apple no poet had been born who could compete in skill with himself, but his existing lyrics have neither the tenderness nor the ingenuity of those of his illustrious lady-love. The poems of Beatrix are remarkable for a simplicity of form rare among the poets of her age. Marcabrun (*c.* 1120–95), from whose pen some 40 poems survive, was an innovator and a reformer; to him the severity of classical Provençal style is mainly due, and he was one of the first to make use of that complex form which was known as the *trobar clus.* He posed as a violent misogynist—"I never loved and I was never loved." Marcabrun expresses great affection for "that sweet poet," Jaufre Rudel, prince of Blaye, whose heart turned, like the disk of a sunflower, towards the Lady of Tripoli. Little else than that famous adventure is known about the career of this ultra-romantic troubadour, except that he went as a crusader to the Holy Land, and that his surviving poems have so mystical a tone that Jaufre Rudel has been suspected of being a religious writer who used the amorous language of his age for sanctified purposes, and whose "Princess Far-away" was really the Church of Christ. Peire d' Alveona (Peter of Auvergne), like Marcabrun, was of mean birth, son of a tradesman in Clermont-Ferrand, but he was handsome and engaging, and being the first troubadour who had appeared in the mountain district, "he was greatly honoured and fêted by the valiant barons and noble ladies of Auvergne." It is believed that Peire's poems were produced between 1158 and 1180. He flourished at the court of Sancho III., king of Castile, and afterwards at that of Ermengarde, viscountess of Narbonne.

It is doubtless owing to the repeated praise which was given by Dante, in the *Inferno* and elsewhere, to Arnaut Daniel that this name remains the most famous among those of the troubadours. He was a knight of Riberac, in Perigord, and attached himself as a troubadour to the court of Richard Cœur de Lion. Dante calls Daniel the "smith," the finished craftsman, of language, and it is evident that it was the brilliant art of the Provençal's elaborated verse which delighted the Italian. His invention of forms of verse (*see* SESTINA), in particular, dazzled the great Italian. Dante was curiously anxious to defend Arnaut Daniel as being a better artist than his immediate rival, Giraut de Bornelh; critical posterity, however, has reversed this verdict. Giraut laments, in his poems, the brutality of the age and the lawlessness of princes. A troubadour of the same district of south-western France was Arnaut de Mareuil, to whom is attributed the introduction into Provençal poetry of the amatory epistle.

Peire Vidal of Toulouse was the type of the reckless and scatterbrained troubadour. His biographer says that he was "the maddest man in all the world." His early life was a series of bewildering excursions through France and Spain. At Marseilles he made a mortal enemy of Azalaïs, the wife of Viscount Barral de Baux, from whom he stole a kiss (1180). He committed a thousand follies; among others, being in love with a lady called Louve (she-wolf), the poet dressed himself as a wolf, and was hunted by a pack of hounds in front of the lady's castle. Folquet of Marseilles was a troubadour of Italian race, the son of a merchant of Genoa; Dante met Folquet in paradise, and gives an interesting notice of him. It is in the *sirventés* of Folquet that critics have seen the earliest signs of that decadence which was so rapidly to destroy Provençal poetry.

Gaucelm Faidit came from Uzerche, in the Limousin. He seems to have been a wandering minstrel of gay and reckless habits, and to have been accompanied by a light-o'-love, Guillelma Monja, who was the object of much satire and ridicule. Another troubadour, Raimbaut of Vaquières, passed the greater part of his life at the same court of Montferrat; he devoted himself to the Lady Beatrix, sister of the marquis. The most celebrated of the Italian troubadours was Sordello, born at Mantua, at the beginning of the 13th century, who owes his fame to the benevolence of later poets, from Dante to Robert Browning.

We have now mentioned the troubadours who were most famous in their own time, and on the whole modern criticism has

been in unison with contemporary opinion. There are, however, still one or two names to be recorded. The English historian of the troubadours, Dr. Hueffer, gave great prominence to the writings of Guillem de Cabestanh (or Capestang). This was a knight of Roussillon, who made love to Seremonda, countess of Castel-Roussillon. The lady's husband slew him in a paroxysm of jealousy and, having cut out his heart, had it delicately cooked and served to his wife's dinner. When Seremonda had eaten her lover's heart, her husband told her what she had done, and she threw herself out of the window and was killed. Feeling grew so strong that the surrounding nobles, with Alfonso, king of Spain, at their head, hunted the murderer down and killed him. The bodies of the lady and the troubadour were buried side by side, in the cathedral of Perpignan, and became the objects of pilgrimage.

The great cause of the decadence and ruin of the troubadours was the struggle between Rome and the heretics. This broke out into actual war in June 1209, when the northern barons, called to a crusade by Pope Innocent III., fell upon the Albigenses and pillaged Béziers and Carcassonne. Most of the protectors of the troubadours were, if not heretics, indulgent to the heretical party, and shared in their downfall. The poets, themselves, were not immediately injured, but the darkness began to gather round them as the ruin of Languedoc became more and more complete, culminating with the siege of Toulouse in 1218. The greatest name of this period, which was the beginning of the end, is that of Peire Cardenal, of Le Puy. He was protected by Jacme I., king of Aragon, having apparently fled from Narbonne and then from Toulouse in order to escape from the armies of Simon de Montfort. He was the inventor of the moral or ethical *sirventés;* and the author of singularly outspoken satires against the clergy. Another troubadour of this time was Guillem Figueira, the son of a Toulouse tailor, an open heretic who attacked the papacy with extraordinary vigour, supported and protected by Raimon II. Figueira was answered, strophe by strophe, by a female troubadour, Gormonda of Montpellier. The ruin of the southern courts, most of which belonged to the conquered Albigensi party, continued to depress the troubadours, whose system was further disintegrated by the establishment of the Inquisition. The genial and cultured society of Provence and Languedoc sank rapidly into barbarism, and there was no welcome anywhere for secular poets.

The last of the French troubadours was Guiraut Riquier (*c.* 1230–94), who was born at Narbonne, and found protection at the Spanish court of Alfonso X. the Learned. Riquier, in a *sirventé* of about 1285, gives pathetic expression to his sense of the gathering darkness, which makes it useless and almost unbecoming for a troubadour to practise his art, while of himself he mournfully confesses: "Song should express joy, but sorrow oppresses me, and I have come into the world too late." Guiraut Riquier passed away about 1294, and left no successor behind him.

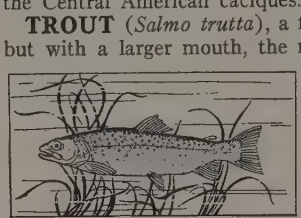
TROUBRIDGE, SIR THOMAS, BART. (*c.* 1758–1807), English admiral, was educated at St. Paul's school, London, and entered the navy in 1773. Having seen some service in the East Indies, he was taken prisoner by the French in 1794. In Feb. 1797 he commanded his ship, the "Culloden," at the battle of Cape St. Vincent. In the following July he assisted Nelson in the unsuccessful attack on Santa Cruz. He served in the Mediterranean and was created a baronet in 1799; from 1801 to 1804 he was a lord of the admiralty, being made a rear-admiral just before his retirement. In 1805 Troubridge was given a command in the East and he went out in the "Blenheim." He was drowned in the wreck of the "Blenheim" off Madagascar, in Jan. 1807.

TROUPIAL, a collective name suggested by Ridgway for the American family Icteridae, which includes the North American orioles, meadow-larks, cowbirds, grackles and blackbirds and the Central American caciques.

TROUT (*Salmo trutta*), a fish closely related to the salmon but with a larger mouth, the maxillary extending to below the posterior edge of the eye in fish 6 in. long well beyond the eye in larger ones, and with the caudal fin less emarginate. In the sea the trout ranges from Iceland and northern Europe to the Bay of Biscay, but as a fresh-water fish occurs in the countries north of the Mediterranean eastwards to Greece, and in Corsica, Sardinia and Algeria: a trout from the mountains of south-east Morocco has been described by Pellegrin as *Salmo pallaryi* (*Bull. Mus.,* Paris 1922). The trout of the Black, Caspian and Aral seas and their tributaries have smaller scales. The sea trout is silvery, with X-shaped blackish spots; it ascends rivers to breed and forms fresh-water colonies in every river and lake that it enters; the presence of trout in the Mediterranean countries indicates that in glacial times sea-trout frequented the Mediterranean. The river and lake trout show great difference in size and coloration and many specific names have been given but it seems clear that all are but varieties of the one main species. In large lakes a weight of 50 lb. may be attained, whereas in some small mountain streams a fish of 4 oz. is exceptional; the coloration varies from silvery white to blackish, with spots that may be few or many, stellate or rounded, black, brown or red.



TROUT (SALMO TRUTTA)

In eastern North America the name trout is given to a char (*Salvelinus fontinalis*) and in the west this name is given to the steelhead (*S. gairdneri*) of the Pacific coast and its numerous fresh-water derivatives, which exhibit just as much diversity in coloration as the trout of Europe and have received even more specific names; the best known is the rainbow trout (*S. irideus*). These trout of the Pacific slope have the caudal fin spotted, and often a red band along the side of the body; their relationship to the trout of Europe is not very close, their nearest allies being the various other Pacific species of *Salmo,* which are generally termed salmon.

For trout-fishing *see* ANGLING.

TROUVÈRE, the name given to the mediaeval poets of northern and central France, who wrote in the *langue d'oil* or *langue d'oui.* The trouvères flourished abundantly in the 12th and 13th centuries. They were court-poets who devoted themselves almost exclusively to the composition and recitation of a particular kind of poetry, the subject of which was some refinement of love.

The first appearance of trouvères seems to date from 1137, when Eleanor of Aquitaine, herself the granddaughter of an illustrious troubadour, arrived in the court of France as the queen of Louis VII., speaking the Poitiers dialect of the *langue d'oc.* She was queen for 15 years (1137–52), the period during which the southern influence was strongest in the literature of northern France and the successive crusades tended to produce relations between the two sections of poetical literature. The northern poets rarely approach the grace and delicacy of the troubadours, while their verse shows less ingenuity and less variety. The earliest trouvères like Conon de Béthune and Hugues de Berze, in writing their amatory lyrics, were, however, certainly influenced by what troubadours had written.

The poetical forms adopted by the trouvères bore curious and obscure names, the signification of which is still in some cases dubious. The rotruenge was a song with a refrain; the servento

n spite of its name, quite unlike the sirventes of the troubaand had a more ribald character; the estrabot was allied to *trambotto* of the Italians, and was a strophic form "comof a front part which was symmetrical, and of a tail which be varied at will" (Gaston Paris).

e court poetry of the trouvères particularly flourished under rotection of three royal ladies. Marie, the regent of Cham-, was the practical ruler of that country from 1181 to 1197, he encouraged the minstrels in the highest degree and dis- the art of verse with Chrétien of Troyes. Her sister, Aélis ice, welcomed the trouvères to Blois; she was the protector autier d'Arras and of Le Châtelain de Coucy. Another Aélis, became the second queen of Louis VII. in 1160, received n de Béthune in Paris, and reproved him for the Picard accent which he recited his poetry. At the end of the 12th century efinement and elegance of the court-poets was recognized in orth of France by those who were responsible for the educaf princes. A trouvère, Gui de Ponthieu, was appointed tutor illiam III. of Macon, and another, Philippe of Flanders, to ope Auguste. The vogue of the trouvères began during the crusade; it rose to its greatest height during the fourth cruand the attack upon the Albigenses. The first 40 years of the century was the period during which the courtly lyrical poas cultivated with most assiduity. At first it was a purely cratic pastime, and among the principal trouvères were es such as Thibaut IV. of Navarre, Louis of Blois and John, of Jerusalem. About 1230 the taste for court poetry spread e wealthy bourgeoisie, especially in Picardy, Artois and Flan- Before its final decline, and after the courts of Paris and had ceased to be its patrons, the poetry of the trouvères d its centre at Arras, where some of the most skilful of all the ères, such as Jacques Bretel and Adam de la Halle, exercised art. About 1280 the poetical system suddenly disappeared. e poet was invariably a lover, devoted to a married lady who not his wife, and to whose caprices he was bound to submit ly and patiently. The progress of this conventional courtship aid down according to certain strict rules of ceremonial; love ne a science and a religion, practised by the laws of precise ette. The *rondel* of Adam de la Halle (published in E. de semaker's edition, 1872) beginning

"À Dieu courant amouretes,
Car je m'en vois
Souspirant en terre estrange!"

s perhaps the highest point to which the delicate, frosty art of rouvères attained. Music took a prominent place in all their rmances, but little is known of the melodies which they used. enough has been discovered to justify the general statement ersot that "we may conclude that the musical movement of ge of the trouvères was derived directly from the most ancient of popular French melody." A precious ms. in the Faculty edicine of Montpellier contains the music of no fewer than part-songs attributed to trouvères.

BLIOGRAPHY.—E. de Coussemaker, *Art harmonique aux XII^me^ III^me^ siècles* (1865); A. Jeanroy, *Les Origines de la poésie ue en France au moyen âge* (1889); J. Tiersot, *Histoire de la on populaire en France* (1889); H. Binet, *Le Style de la lyrique oise en France aux XII^me^ et XIII^me^ siècles* (1891); G. Paris, Origines de la poésie lyrique en France au moyen âge (1892). works of the principal trouvères have been edited; those of Le elain de Coucy by F. Michel (1830); of Thibaut IV., King of rre, by P. Tarbé (1831); of Adam de la Halle by E. de semaker (1872); of Conon de Béthune by Wallensköld (Helsing-1891).

ROUVILLE, a seaside town of north-western France, in lepartment of Calvados, on the Engiish channel, 34 m. N.E. aen by rail. Pop. (1926) 5,869. Trouville stands at the h of the Touques on its right bank opposite Deauville. Its stretches of sand and excellent bathing make it the most ented French resort on the channel. Deauville is well known ts race-course and villas. The port, shared with Deauville formed by the Touques, is entered by a channel between s with a depth at high tide of 17½ ft.; it is supplied with a tide dock, filled to scour the channel, and a floating dock, with average depth of 18 ft. Timber, coals and cement are imported. The London and South Western railway company have a daily steamboat service from Havre to Trouville in connection with their Southampton and Havre boats.

TROWBRIDGE (trō'brĭj), a market town, Westbury parliamentary division, Wilts., England, 97¼ m. W. by S. of London by the G. W. railway. Pop. of urban district (1921) 12,130.

Trowbridge was mentioned in Domesday under the name of Straburg, a manor held by one Brictric together with Staverton and Trowle, now both included within its limits. The first reference to the "town" of Trowbridge occurs early in the 16th century; previous to that date mention is made of the manor and castle only. Trowbridge is now a non-corporate town. It is now the chief centre of the West of England woollen industry and makes broadcloth and other woollen goods.

TROY, a city of south-eastern Alabama, U.S.A., county seat of Pike county; on Federal highway 231, and served by the Atlantic Coast and the Central of Georgia railways. Pop. (1920) 5,696 (50% negroes); estimated locally at 8,500 in 1928. It is the seat of a State Normal School (1887); the trade centre of a rich agricultural region, producing especially cotton, cattle, hogs and peanuts; and has several manufacturing industries. The city was founded in 1823.

TROY, a city of eastern New York, U.S.A., the county seat of Rensselaer county; on the east bank of the Hudson river, 7 m. above Albany, at the mouth of the Mohawk. It is on Federal highway 9 and the State Barge canal, and is served by the Boston and Maine, the Delaware and Hudson, the New York Central and electric railways, motor-bus and truck lines and river steamers. Pop. (1920) 72,013 (83% native white); 1928 local estimate 75,000. Across the river are Cohoes and Watervliet, connected with Troy by bridges, and Schenectady is only 15 m. north-west. The city has a water front of 7 m. and an area of 9·32 sq.m., rising from the river to hills on the east 400 ft. high. Its seven parks cover 276 acres. The Catskill mountains are visible on the south-western horizon. Troy is at the head of steamboat navigation on the Hudson. Two rapid streams, Poesten kill and Wynants kill, flowing into the Hudson from the east through deep ravines, furnish water-power, and hydro-electric current also is available. Troy has long been an important industrial and commercial city. It is the principal centre in the United States for the manufacture of collars, and among its other leading products are shirts, men's clothing, surveying instruments, abrasives, valves, hydrants, bells, chains, brushes and automobile parts. The aggregate factory output in 1927 was valued at $76,880,913. Among the educational institutions in the city are the Rensselaer Polytechnic institute, founded in 1824 by Stephen Van Rensselaer of Albany, the oldest school of science with a continuous existence in the country.

The site of Troy was part of the Van Rensselaer manor grant of 1629. In 1659 it was bought from the Indians, with the consent of the patroon, by Jan Barentsen Wemp, and in 1707 it passed into the hands of Derick van der Heyden. In 1777 Gen. Philip Schuyler had his headquarters on Van Schaick's island, in the Mohawk and Hudson. After the close of the Revolution there was an influx of settlers from New England; a town was laid out on the Van der Heyden farm; in 1789 the name of Troy was adopted in town-meeting; in 1793 the county seat was established here; in 1794 the village was incorporated, and in 1816 it was chartered as a city. A newspaper, *The Farmer's Oracle*, began publication in 1797. In 1812 a steamboat line was established between Troy and Albany, and in 1825 the Erie canal was opened. During the War of 1812 Troy filled large contracts for army beef. Puddling works were opened in 1839, and for many years the city was the centre of the iron and steel industry of New York. The second Bessemer steel works in the United States was established here in 1865. During the Civil War Troy supplied much cannon and ammunition, and made the armour-plate and part of the machinery for the "Monitor." The last steel and iron works discontinued operations about 1896. The collar industry dates its origin from 1819, when Hannah Lord Montague of Troy had the ingenious idea of making separate collars for her husband's shirts. The idea spread, and in 1829 Ebenezer Brown, a local

merchant, had collars made to sell in his store. The manufacture of cuffs was begun in 1845. After the introduction of the sewing machine in 1852 the industry grew rapidly, reaching its peak about the time of the World War. The city had a population of 28,785 in 1850; 39,235 in 1860; 56,747 in 1880; 60,651 in 1900; 76,813 in 1910. In 1820, 1854 and 1862 it suffered from destructive fires.

TROY, a city of western Ohio, U.S.A., the county seat of Miami county; on the Dixie highway and the west bank of the Great Miami river, 20 m. N. of Dayton. It has a landing field, and is served by the Baltimore and Ohio and the Big Four railways, interurban trolleys and bus lines. Pop. (1920) 7,260 (92% native white); 1928 local estimate 9,000. Troy was settled in 1807 and was chartered as a city in 1890.

TROY and **TROAD.** **The Troad** (*ἡ τρῳάς*), or land of Troy, is the north-west promontory of Asia Minor, between the valleys of the Caicus on the south and the Aesepus flowing into Propontis on the east. The eastern limit was variously defined by ancient writers. Geographically, it is undoubtedly (as Strabo says) the range of Ida, which, from the north shore of the Adramyttian gulf, sends its north-western spurs nearly to the coast of the Propontis. The greatest length of the Troad from north-west at Cape Sigeum (Yeni Shehr), to the south-west at Cape Lectum (Babā Kale), is about 40 m.; the breadth, not much greater. The central area is drained by the Menderes (anc. *Scamander*), which rises in Ida and reaches the Hellespont east of Cape Sigeum.

Timber is supplied by pine forests on Mt. Ida. But the plains and hills are fairly wooded. Besides valonia oak, there are elm, willow, cypress and tamarisk, with lotus, galingale and reeds, as in Homeric days, about the streams. The vine is cultivated; watermelons are abundant; cotton, wheat and maize are grown. Even under Turkish rule, the natural advantages of the land mitigated the poverty of its inhabitants; in antiquity it was fertile and populous.

Early History.—In Greek legend, Priam of Troy ruled all that is bounded by "Lesbos, Phrygia and the Hellespont" (*Il.* xxiv. 544). The Achaeans under Agamemnon destroyed Troy, and overthrew Priam's dynasty. But there is Homeric prophecy that Aeneas and his descendants shall still rule over the Troes, in a passage probably later than the bulk of the book, and it is certain that in the 7th or 6th century B.C. reputed descendants reigned somewhere in the Troad. Thracian tribes, including Bithynians and Treres, swept into Asia Minor from Europe in the 7th century B.C., and the Ionian poet, Callinus, recorded the terror which they caused.

Greek Settlements.—The earliest and most important of the Greek settlements were Aeolic, mainly from Lesbos and Cyme in Aeolis; some may have been as early as the 13th century B.C. About 620 B.C. Athenians occupied Sigeum, and were resisted by Aeolic colonists from Mytilene, already established in that neighbourhood.

Chief Greek towns in the Troad were Ilium in the north, Assus (*q.v.*) in the south, and Alexandria Troas (*q.v.*) in the west. The site of the Greek Ilium is marked by the low mound of Hissarlik (Turk. "place of fortresses") in the Trojan plain, about 3 m. from the Hellespont, the traditional site of Homer's "Troy." When Xerxes visited the Trojan plain, he "went up to the Pergamon of Priam," and sacrificed to the Ilian Athena. Ilium yielded to Dercyllidas in 399 B.C., and was captured by Charidemus in 359 B.C., but was evidently still of small importance when, in 334 B.C., Alexander visited it on landing in the Troad. In their temple of Athena the Ilians showed him arms which had served in the Trojan war, including the shield of Achilles. Either then or after the battle of Granicus, Alexander enlarged the town to be a "city," with political independence and exemption from tribute. Lysimachus executed the intentions of Alexander when north-west Asia Minor fell to him in 301 B.C., building a wall 5 m. in circumference, incorporating decayed towns of the neighbourhood, and building a temple of Athena. In the 3rd century B.C. Ilium was the head of a federal league of free Greek towns, from Lampsacus on the Hellespont to Gargara on the Adramyttian gulf. In 278 B.C. the Gauls, under Lutarius, occupied Ilium, but abandoned it. Forty years later (218 B.C.) other Gauls brought by Attalus I. for his war against Achaeus, deserted his stam pillaged the towns on the Hellespont, and besieged Ilium, which, however, they were driven off by the troops of Alexa Troas. In the 2nd century B.C. Ilium was in decay; as Deme of Scepsis says, the houses "had not even roofs of tiles." temple of Ilian Athena, however, retained its prestige; in B.C. Antiochus the Great visited it before sailing to the ai the Aetolians. In 190 B.C., before the battle of Magnesia, Ro and Ilians were alike eager to recall the legend of Roman de from Aeneas; Lucius Scipio offered sacrifice to the Ilian Ath and after the defeat of Antiochus the Romans annexed Rhoe and Gergis to Ilium, "not so much in reward of recent service in memory of the source from which their nation sprang." later history of Ilium is a catalogue of Roman benefact though, in 85 B.C., when Fimbria took it, he left it in r Sulla, however, was careful to rebuild it; Augustus confirme ancient privileges and gave it new territory; Caracalla (A.D. 217), like Alexander, paid honours to the tomb of Achilles the 4th century, the Ilians were attracting tourists by their pse Trojan memorials. After the 4th century the place is los view.

Of the other ancient cities, *Neandria* seems to be rightly at Mt. Chigri, not far from Alexandria Troas, remarkable fo fine view of the whole Troad. *Cebrene* has been located in eastern part of the plain of Bairamich; *Palaeoscepsis*, farther on Ida, while the new *Scepsis* was near Bairamich. At Kul south of the mouth of the Tuzla, Corinthian columns mark temple of Apollo Smintheus (excavated in 1866 by Pullan) (approximately) the Homeric *Chryse*. *Colonae* was on the opposite Tenedos. *Scamandria* was at Eneh, in the plain of B mich, and *Cenchreae* probably some way north of it. The sh of Palamedes, *Polymedium*, has been discovered by J. T. Cl between Assus and Cape Lectum; the sacred enclosure and statue of Palamedes were on the acropolis. Clarke also found ancient walls on Gargarus, the highest peak of Ida.

The Site of Troy.—The traditional site, at the Hellen Ilium, is the mound of Hissarlik, on a spur between the Scamander valley and its last tributary from the east (*Simois*), about 3½ m. from the Hellespont and from the Ae shore, north of Besika bay. The famous academic dispute cerning the site, which began about A.D. 160 with Demetriu Scepsis, may be regarded as settled by the discovery, mad 1893, of a fortress on the mound of Hissarlik, contempo with the great period of Mycenae, and overlying the smaller the earlier acropolis first identified by Schliemann in 1872. rival ruins of a small hill fort on the Bali Dagh which, with other on an opposite crag, commanded the gorge where the mander descends into the plain neither accord with Homeric scription nor challenge the remains at Hissarlik in importa

No site in the Troad accords completely with all the t graphical clues ingeniously derived from the text of Homer. hot and cold springs that lay just without the gate of "Troy" no more to be identified with Bunarbashi, which wells out than a mile from the Bali Dagh ruins, than with the choked duits south of Hissarlik, opened by Schliemann in 1882. But broader topography is recognizable in the modern plain of Menderes. The old bed of that river is the Scamander, and little tributary, the Dumbrek Su, is the Simois. In their fork Hissarlik or Troy. In sight of it are, on the one side, the p of Samothrace (Il. xiii. 11–14); on the other Mt. Ida Dagh: viii. 52). Hissarlik lies in the plain (xx. 216), ea reached by foes from the shore, or left and regained in a n by a Trojan visiting the Achaean camp (vii. 381–421).

Archaeological Investigation of Troy.—Schliemann's cavations at Hissarlik in 1872–74, supplemented and confir by W. Dörpfeld in 1891–94, established the existence of superposed settlements, as follows:—

1. On the virgin soil of the natural hillock a small village the late Aegean Neolithic period, at the dawn of the Bro age, contemporary with the upper part of the Cnossian N lithic bed, includes what were supposed by Schliemann to be primitive settlements. Thin walls of rough stones, bonded w

reveal no house-plans, nor traces of fortress wall. Imple-
s in obsidian and various kinds of stone, clay whorls, a little
ed ivory, accompany dark monochrome pottery, hand-pol-
, with simple geometric decoration, incised and often filled
white.

Superposed and comprehending a larger area, lies the "second
" better constructed and preserved, and twice rebuilt. Its
ive fortress wall of rudely squared "Cyclopean" masonry
red several restorations and eventual destruction, except on
outh. Double gates at south-east and south-west are well-
rved. The most complete and most important structures
n are a *megaron* and vestibule of the type familiar in "My-
ean" palaces, with one or more smaller replicas alongside it,
he "women's quarters" at Tiryns (*q.v.*) and Phylakopi. (*See*
AN CIVILIZATION.) This is the fortress proclaimed by Schlie-
n in 1873 to be the "Pergamos" of Troy, mainly because it
hed by fire. But this second stratum belongs to a primitive
of local civilization preceding the "Mycenaean," which is
earliest recalled by the Homeric poems. The pottery now
s the first rare use of paint, and of technique and fantastic
s parallel to those of the pre-Mycenaean Cyclades. Trough-
ted vases are characteristic, and rude reproductions of human
res are common in this ware, which seems all native. Bronze
ome into use for implements, weapons and vessels; a hoarded
ure found in the ruins of the fortification wall includes much
and silver. But the forms are primitive and the workman-
very rude. Personal ornaments are cut out of thin plate
or built of coiled wire. But some of the discs, bracelets and
ants, with advanced spiral ornament, found in 1878 and as-
d to this stratum, belong undoubtedly to the sixth or "My-
ean." Rough fiddle-shaped idols, whorls, a little worked
and some lead make up a find, of whose early period (prob-
about 2000 B.C.) comparison of objects found elsewhere
s no doubt. This treasure is now deposited in Berlin with
ulk of Schliemann's collection.

4, 5. After the burning of the "second city," Hissarlik
d for a time to have any considerable population. Three
village settlements have left their traces superposed and
only slight advances of material culture.

The mound, however, occupied too important a site, in
ion to the plain and the sea, to remain desolate, and it was
pied in the 14th or 13th century by a great fortress, while a
not yet explored, spread below. This "sixth city" was first
nguished clearly by Dörpfeld in 1882, but Schliemann's dras-
nethods confused its commoner pottery and metal objects
those of lower strata; and some grey ware, to which Schlie-
n gave the name "Lydian" was alone referred to this sixth
Lydian" city, in his *Troja* (1884). This ware has been com-
d with the "Minyan" fabric at Orchomenus, but also re-
les the "Lausitz" pottery, which originated on the middle
ube, and was intruded into Macedonia at the close of the
century. For years this "sixth city" was neglected.

1893, however, excavations in hitherto undisturbed ground
de the earlier fortress, exposed a wall of massive ashlar
nry resembling the fortifications of Mycenae itself, and
cenaean" walls at Phylakopi in Melos. With this wall oc-
d not only the grey ware, but painted potsherds unmistak-
"Mycenaean"; and further search showed that such sherds
characteristic of "sixth city" deposits. The inevitable in-
ce is that this city imported contemporary "Mycenaean"
to supplement its own ruder products. The area of its
el is larger than the "second city," its buildings, which include
ge *megaron*, are of finer construction. This was the most
rtant city yet built on the mound. It belonged to the
cenaean" age, which precedes the composition of the Homeric
s, and is reflected by them. Therefore this is Homer's Troy.
s remains, however, having been obliterated on the crown of
rlik, almost escaped recognition, for when, long afterwards,
Hellenistic Ilium was built, the top of the mound was cut
and the uppermost strata vanished. Thus we find them
on the southern slope of the mound only, but have no diffi-
in estimating their original extent. Tombs and the outer
quarters of this city will doubtless be found eventually.

7. The "sixth," or "Mycenaean" Troy, perished by violence like the "second city," but its inhabitants reoccupied its ruins, until, in early Hellenic times, the small unfortified settlement was established which maintained itself till the Homeric enthusiasm of Alexander the Great called a city again into being on Hissarlik.

8. The Hellenistic Ilium, however, has left comparatively little trace; fortifications erected by Lysimachus are visible on the acropolis and in the plain. A small Doric temple belongs to this city, and a larger one, probably dedicated to Athena, seems to be of Pergamene age. Fragments remain of its metopes, representing Helios and a Gigantomachia. Coins of this city show Athena on both faces, and inscriptions prove that Hellenistic Ilium was of some importance.

9. Lastly, about the Christian era, the Graeco-Roman city built a theatre and an ornate gateway on the south-east slope, a large building on the south-west and others to north-east. This city seems to have decayed in the 5th century A.D.

The Legend of Troy.—In Greek legend, the oldest town in the Troad was that founded by Teucer, who was a son of the Scamander (a Cretan stream, according to Tzetzes) and the nymph Idaea. In his reign, Dardanus, son of Zeus and the nymph Electra, daughter of Atlas, in consequence of a deluge, drifted from Samothrace to the Troad, where he received land from Teucer, married his daughter Batea, and founded Dardania, at the foot of Mt. Ida. On the death of Teucer, Dardanus succeeded him, and called the whole land Dardania. He begat Erichthonius, who begat Tros by Astyoche, daughter of Simois. Tros called the country Troy and the people Troes (Trojans). By Callirrhoe, daughter of Scamander, Tros had three sons—Ilus, Assaracus and Ganymede. From Ilus and Assaracus sprang two separate lines; Ilus, Laomedon, Priam, Hector; and Assaracus, Capys, Anchises, Aeneas. Ilus went to Phrygia, where he received, as a wrestling prize from the king of Phrygia, a spotted cow, with an injunction to found a city where she lay down. The cow lay down on the hill of the Phrygian Atē; here Ilus founded Ilion; and Dardania, Troy and Ilion became one city. Desiring a sign from Zeus, Ilus prayed and found lying before his tent the Palladium, a wooden statue of Pallas, for which he built a temple. By Eurydice, daughter of Adrastus, he had a son, Laomedon, who married Strymo, daughter of Scamander (or Placia, daughter of Atreus or of Leucippus). In his reign, Poseidon and Apollo (or Poseidon alone), built the walls of Troy, but Laomedon withheld their reward. In his reign also, Heracles besieged and took the city, slaying Laomedon and his children, except one daughter, Hesione, and one son, Podarces. The life of Podarces was granted at the request of Hesione, on condition that Podarces first be a slave and then be redeemed by Hesione; she gave her veil for him; hence his name of Priam (Gr. πριάσθαι, to buy). Priam married first Arisbe and afterwards Hecuba, and had 50 sons and 12 daughters. Among the sons were Hector and Paris, and among the daughters Polyxena and Cassandra. Paris, betrothed to Oenone, awarded the golden "apple of strife" to Aphrodite (who promised him the love of the fairest of women) and brought upon Troy the resentment of Hera and Athena. Thereafter, Paris, visiting Sparta, found favour with Helen, heiress of

Tyndareus and wife of Menelaus, son of Atreus, and carried her to Troy. To recover Helen, the Achaeans under Agamemnon, brother of Menelaus, besieged Troy for ten years. In the tenth year Hector was killed by Achilles, and he by Paris. At last a wooden horse was contrived in whose hollow many Achaean heroes hid themselves. Their army and fleet then withdrew to Tenedos, feigning to have raised the siege. The Trojans conveyed the wooden horse into Troy; in the night the Greeks stole out, opened the gates to their friends, and Troy was taken. *See* also HOMERIC POEMS.

See Homer, *Il.* vii. 452 *seq.*, xx. 215 *seq.*, xxi. 446 *seq.*; Apollodorus ii. 6, 4, iii. 12; Diodorus iv. 75, v. 48; Tzetzes, *Schol. on Lycophron*, 29, 72, 1302; Conon, *Narrat.* 21; Dionysius Halicarn., *Antiq. Rom.* i. 68 *seq.* The *Iliad* deals with a period of 51 days in the tenth year of the war: the *Odyssey* with the wanderings and homecoming of an Achaean leader, Odysseus. The Historical Background of the Trojan War.—The "Tale of Troy," with legends of heroes who "fought in the war," was popular already when the *Odyssey* (*see* HOMER) was composed; wherein, besides other allusions, minstrels sing lays about it, and the Sirens boast that they "know it all." From the 7th century B.C., at least, it supplied subjects to vase painters and other craftsmen, and in the 5th, to the sculptors of the Aegina pediments (*see* GREEK SCULPTURE), and to Athenian dramatists. (*See* DRAMA: *Greek.*) Herodotus and Thucydides, like ancient writers generally, accepted the Trojan war as historical, though they criticized epic statements in detail, and Herodotus noted discrepancy between the *Cypria* and the *Iliad*. Ephorus, and afterwards Strabo, marshalled geographical learning as commentary on the Achaean and Trojan "catalogues" in *Il.* ii.; the scholars of Alexandria elucidated Homeric antiquities, those of Pergamum their topographical and historical background; Demetrius of Scepsis in the Troad, misdoubted, on geological grounds, the reputed site of Troy. Traditional genealogies, collated by Hecataeus (*q.v.*) and others, enabled Eratosthenes (*q.v.*) to date the "Fall of Troy" to 1194 B.C., in the third generation before the "coming of the Dorians" and in the second after Laomedon's foundation. Homeric references to Egypt (where Thebes, not Memphis, is the capital) and to Phoenicia (where Sidon is known, but not Tyre) supply a historical background for the war, not later than the 12th century; but the names of Egyptian kings (*Thôs, Thuôris*) in epic and classical tradition, are not identified: Pliny (36·64) alludes to a Rameses "in whose time Troy fell." Egyptian references, however, to repeated sea-raids into the Levant, between 1230 and 1190 B.C., depict a situation closely resembling Homeric descriptions; and the *Aquaiusha* (*Akhaywasha*), *Danauna, Tikkara* (*Tzakarai*) and probably other participants in these raids may be safely recognized as Achaeans, Danaans, and Teucrians in Greek tradition. Hittite documents confirm the existence of an oversea régime called Akkhayawa, aggressive against south-west Asia Minor, one of whose leaders, Attarissyas, active in Caria and north Syria about 1230, was a contemporary, if not namesake, of Atreus, father of Agamemnon. Consequently, 19th century doubts as to the historical content of epic tradition, and attempts to discover "solar" and other mythological allegories in the personages and events of the war, are being superseded by recognition of a social and political régime historically assignable to the 13–12th centuries, of which the following are turning-points: (1) The establishment of the Trojans, with other Thraco-Phrygian peoples, in north-west Asia Minor before 1260 B.C. fully justifying the defensive alliance between the Hittite king and Rameses II. in 1271 B.C. (2) The consolidation of a dominion, of which the "sixth city" at Hissarlik was an important centre; the geographical range of Priam's vassals, from the Axius river to the Xanthus, and the memory of a great fight "on the Sangarius river" far inland, are instructive. (3) The overthrow of Hittite dominion by this new régime, about 1200 B.C., followed by the land-and-sea-raids of 1197–94 as far as south Palestine, where they were stopped by Rameses III. (4) The counterparts, west of the Aegean, of the dynasty Laomedon-Priam-Hector, are the "divine born" kingships (Pelops-Atreus-Agamemnon, Aeacus-Peleus-Achilles, and the like) established by adventurers of unknown antecedents, and foreign na from Ithaca and Aetolia to Crete and Rhodes, and as far n as Thessaly; their distribution closely covering that of the " Mycenaean" settlements, which are surely dated archaeologi to these generations, in Egypt, Cyprus and Palestine. Whether the destruction of the "sixth city" resulted from attack of this "Achaean" confederacy of the south-west Aegea the Hellespontine citadel of its Thraco-Phrygian cousins directly from those Danubian representatives of the "Lau culture which characterizes the "seventh city," and is reco able as a disturbing factor in Macedonia also, later in the century, cannot at present be determined; nor the value of synchronism between the attack on Troy and the great sea-land-raids towards Egypt, of which the tale of Tithonus Memnon may preserve echoes. (6) Traditions of the estab ment of settlements, eventually Greek, round the margins of Late Mycenaean world, are so numerous, and coherent both Homeric and with archaeological evidence, that they may be cepted as an essentially historical counterpart of the situa described in the *Odyssey;* which, however, was transforme profoundly by the "coming of the Dorians" as the Mycen world had been by the irruption of the "divine born" adventu five generations before. Between those two crises lies the "He Age" of the Aegean; of its central episodes one is the stru between Argos and Thebes, ended by the tragic fall of the meian dynasty; the other is the Trojan war, as disastrous to victors as to the conquered. (J. L. My

The Mediaeval Legend of Troy.—The mediaeval *Roma Troie,* exercised greater influence in its day and for cent after its appearance than any other work of the same class. as the *chansons de geste* of the 10th century were the direct cestors of the prose romances which afterwards spread thro out Europe, so, even before Heliodorus and Achilles Tatius, were quasi-histories, which reproduced in prose, with more or exactness, the narratives of epic poetry. The Ἡρωικός of Fl Philostratus (*fl.* 3rd century A.D.) is a discourse on 26 h of the war. A fictitious journal (*Ephemeris*), professin give the chief incidents of the siege, and said to have written by Dictys of Crete, a follower of Idomeneus, is menti by Suïdas, and was largely used by John Malalas and Byzantine chroniclers. This was abridged in Latin prose, ably in the 4th century, under the title of *Dictys Cretens bello Trojano libri VI.* It is prefaced by an introductory l from a certain L. Septimius to Q. Aradius Rufinus, in which stated that the diary of Dictys had been found in his tom Knossos in Crete, written in the Greek language, but in Ph cian characters. The narrative begins with the rape of Helen includes the adventures of the Greek princes on the return age. With Dictys is always associated Dares, a pseudo-hist of more recent date. Old Greek writers mention an account o destruction of the city earlier than the Homeric poems, and i time of Aelian (2nd century A.D.) this *Iliad* of Dares, prie Hephaestus at Troy, was believed to be still in existence. No has since been heard of it; but an unknown Latin writer, between 400 and 600, took advantage of the tradition to co *Daretis Phrygii de excidio Trojae historia,* which begins wit voyage of the Argo. It is in prose and professes to be trans from an old Greek manuscript. Of the two works that of D is the later, and is inferior to Dictys. The matter-of-fact for narration recalls the poem of Quintus Smyrnaeus. In both pilations the gods and everything supernatural are suppre even the heroes are degraded. The permanent success, how of the two works distinguishes them among apocryphal wri and through them the Troy legend was diffused throughout ern Europe. The Byzantine writers, from the 7th to the century, exalted Dictys as a first-class authority, with Homer was only to be contrasted as an inventor of fables. ern people preferred Dares, because his history was shorter because, favouring the Trojans, he flattered the vanity of who believed that people to have been their ancestors. mss. of both writers were contained in old libraries; and were translated into nearly every language and turned into

the case of both orks, scholars were long undecided whether Greek original ever existed but fragments of the Greek text of ctys have been recovered. (*See* DICTYS CRETENSIS.) The Byntine grammarian, ohannes Tzetzes (*fl.* 12th century), wrote a eek hexameter poem *Iliaca* on the subject. In 1272, a monk of rbie translated "sas rime *L'Estoire de Troiens et de Troie* Dares) du Latin en Roumans mot à mot" because the *man de Troie* was to long. Geoffrey of Waterford put Dares o French prose; and the British Museum has three Welsh ms. nslations of the sam author, of a much later period.

For a thousand years the myth of descent from the dispersed oes of the conquered Trojan race was a sacred literary tradi- throughout western Europe. The first Franco-Latin chroni- s traced their histor to the same origin as that of Rome, as d by the Latin poets of the Augustan era; and in the middle the 7th century Fredegarius Scholasticus (*Rer. gall. script.* ii.) relates how one party of the Trojans settled between the ine, the Danube and the sea. In a charter of Dagobert occurs statement, "ex nobilissimo et antiquo Trojanorum reliquiarum guine nati." This statement is repeated by chroniclers and egyrical writers, who also considered the *History of Troy* by res to be the first of national books. Succeeding kings imi- ed their predecessors in giving official sanction to their legend- origin; Charles the Bad, in a charter, uses almost the same rds as Dagobert, "ex praeclaro et antiquo trojanorum sanne nati." In England a similar tradition had been early mulated, as appears from Nennius's *Historia Britonum* and offrey of Monmouth. The epic founder of Britain was Brutus, , or in another tradition great-grandson, of Aeneas, in any e of the royal house of Troy. The tradition, repeated in ce's version of Geoffrey, by Matthew Paris and others, perd to the time of Shakespeare. Brutus found Albion uninited except by a few giants. He founded his capital on the ks of the Thames, and called it New Troy. Otto Frisingensis th century) and other German chroniclers repeat similar ths. About 1050 a monk named Bernard wrote *De excidio ojae*, and in the middle of the 12th century Simon Chèvre r, canon of the abbey of Saint-Victor, Paris, followed with ther poem in leonine elegiacs on the fall of the city and the entures of Aeneas, in which the Homeric and Virgilian records e blended.

About the year 1184 Benoît de Sainte-More (*q.v.*) composed oem of 30,000 lines entitled *Roman de Troie*. He derived his ormation chiefly from the pseudo-annals of Dictys and Dares, we may justly consider the *Roman de Troie* as an original k. From this source subsequent writers drew their notions of y, mostly without naming their authority and generally with- even knowing his name. This is the masterpiece of the pseudo- sical cycle of romances: and in the Latin version of Guido le Colonne it passed through every country of Europe.

The *De bello trojano* of Joseph of Exeter, in six books, a genu- poem of no little merit, was written soon after Benoît's work about the years 1187–88. At first ascribed to Dares Phrygius Cornelius Nepos, it was not published as Joseph's until 1620, Frankfurt. It was directly drawn from the pseudo-annalists, the influence of Benoît was considerable. Of the same kind the *Troilus* of Albert of Stade (1249), a version of Dares, verse, characterized by the old severity and affected realism. But se Latin works can only be associated indirectly with Benoît, o had closer imitators in Germany at an early period. Herbort Fritzlar reproduced the French text in his *Lied von Troye* rly 13th century), as did also Konrad von Würzburg (d. 1287) his *Buch von Troye* of 40,000 verses, which he himself comed to the "boundless ocean." It was completed by an anonyus poet. To the like source may be traced a poem of 30,000 ses on the same subject by Wolfram von Eschenbach; and ques van Maerlant reproduced Benoît's narrative in Flemish. e Norse or Icelandic *Trojumanna saga* repeats the tale with ne variations.

In Italy, Guido delle Colonne, a Sicilian, began in 1270 and shed in 1287 a prose *Historia trojana*, in which he reproduced *Roman de Troie* of Benoît, and so closely as to copy the errors of the latter. The vivacity and poetry of the Anglo-Norman trouvère disappear in a dry version. The immense popularity of Guido's work is shown by the large number of existing manuscripts. In the 14th and the commencement of the 15th century four versions appeared in England and Scotland. The best known is the *Troy Book*, written between 1414 and 1420, of John Lydgate, who had both French and Latin texts before him. An earlier and anonymous rendering exists at Oxford (Bodleian ms. Laud Misc. 595). There is the *Gest Hystoriale of the Destruction of Troy* (Early Eng. Text Soc., 1869–1874), written in a northern dialect about 1390; a Scottish version (15th century) by a certain Barbour, not the poet, John Barbour; and *The Seege of Troy*, a version of Dares (Harl. ms. 525 Brit. Mus.). The invention of printing gave fresh impetus to the spread of Guido's work. The first book printed in English was *The Recuyell of the Hystoryes of Troye*, a translation by Caxton from the French of Raoul Lefèvre.

BIBLIOGRAPHY.—The Troy legend is dealt with in the elaborate work of A. Joly, *Benoît de Sainte-More et le Roman de Troie* (1870–71); G. Körting, *Der altfranz. Roman de Troie* (1883); F. Settegast, *Benoît de Ste-More* (Breslau, 1876); G. C. Frommann, *Herbort v. Fritzlar u. Benoît de Ste-More* (Stuttgart, 1837); R. Jäckel, *Dares Phrygius u. Benoît de Ste-More* (Breslau, 1875); *Le Roman de Troie*, ed. L. Constans (Soc. d. anc. textes fr. Paris, 1904).

TROYES, a town of France, capital of the department of Aube, 104 m. E.S.E. of Paris on the Eastern railway to Belfort. Pop. (1926) 55,897. The town stands in the wide alluvial plain watered by the Seine, the main stream of which skirts it on the east. It is traversed by several small arms of the river, and the Canal de la Haute-Seine divides it into an upper town, on the left bank, and a lower town, on the right bank. The churches of the town are numerous, and especially rich in stained glass of the Renaissance period. St. Pierre, the cathedral, 13th to 16th centuries, consists of an apse with seven apse chapels, a choir with double aisles, on the right of which are the treasury and sacristy, a transept without aisles, a nave with double aisles and side chapels and a vestibule. There are stained glass windows of the 15th and 16th centuries. The treasury contains some fine enamel work and lace. The church of St. Urban has windows dating for the most part, from the years 1265–80. Most of the old houses of Troyes are of wood, but some are of stone of the 16th century, notably the hôtels de Vauluisant, de Mauroy and de Marisy. The prefecture occupies the buildings of the old abbey of Notre-Dame-aux-Nonnains; the *hôtel-de-ville* dates from the 17th century.

Troyes is the seat of a bishop and a court of assize. Its public institutions include a tribunal of first instance, a tribunal of commerce, a board of trade arbitrators and a chamber of commerce. It has a school of hosiery. The dominant industry in Troyes is the manufacture of cotton, woollen and silk hosiery, printing and dyeing of fabrics.

History.—At the beginning of the Roman period Troyes was the principal settlement of the Trecassi, from whom it derives its name. In the first half of the 4th century its bishopric was created as a suffragan of Sens. St. Loup, the most illustrious bishop of Troyes, occupied the episcopal seat from 426 to 479. In the early middle ages the bishops were supreme in Troyes, but in the 10th century this supremacy was transferred to the counts of Troyes (*see* below), who from the 11th century were known as the counts of Champagne. Under their rule the city attained great prosperity. Its fairs, which had already made it a prominent commercial centre, flourished under their patronage, while the canals constructed at their expense aided its industrial development. The union of Champagne with the domains of the king of France in 1304 was disastrous to the city, since one of the first measures of Louis le Hutin was to forbid the Flemish merchants to attend its fairs. For a short time (1419–25), during the Hundred Years' War, the town was the seat of the royal Government, and in 1420 the signing of the Treaty of Troyes was followed by the marriage of Henry V. of England with Catherine, daughter of Charles VI. in the church of St. Jean. In 1429 the town capitulated to Joan of Arc. The next 100 years was a period of prosperity, marred by the destruction of half the town by the fire of 1524. In the 16th

century Protestantism made some progress in Troyes, but in 1562, after a short occupation, the Calvinist troops were forced to retire, and in 1572 fifty Protestants were put to death. The revocation of the Edict of Nantes in 1685 was a severe blow to the commerce of Troyes, which was not revived by the re-establishment of the former fairs in 1697. The population fell from 40,000 to 24,000 between the beginning of the 16th century and that of the 19th century.

See T. Boutiot, *Histoire de Troyes et de la Champagne méridionale* (4 vols. Troyes, 1870–80); R. Koechlin and J. J. Marquet de Vasselot, *La Sculpture à Troyes et dans la Champagne méridionale au seizième siècle* (1900).

TROYON, CONSTANT (1810–1865), French painter, was born on Aug. 28, 1810, at Sèvres, near Paris, where his father was connected with the porcelain factory. Troyon was an animal painter of the first rank, and was closely associated with the artists who painted around Barbizon. Until he was twenty he laboured assiduously at the minute details of porcelain ornamentation. By the time he reached twenty-one he was travelling the country as an artist, and painting landscapes. Troyon was a favourite with Roqueplan, and became one of his pupils. Roqueplan introduced Troyon to Rousseau, Jules Dupré, and the other Barbizon painters. In 1846 Troyon went to the Hague, and saw Paul Potter's famous "Young Bull." From the studies he made of this picture, of Cuyp's sunny landscapes, and Rembrandt's masterpieces he evolved a new method of painting, and it is only in works produced after this time that Troyon's true individuality is revealed. Troyon died at Paris on Feb. 21, 1865. All his famous pictures are of date between 1850 and 1864. In the Wallace Gallery in London are "Watering Cattle" and "Cattle in Stormy Weather"; in the Glasgow Corporation Gallery is a "Landscape with Cattle"; the Louvre contains his famous "Oxen at Work" and "Returning to the Farm"; while the Metropolitan Museum of Art and other galleries in America, contain fine examples. His "Vallée de la Toucque, Normandy," is one of his greatest pictures. Émile van Marcke (1827–1891) was his best-known pupil.

See H. Dumesnil, *Constant Troyon: Souvenirs intimes* (Paris, 1888); A. Huntin, *"Troyon"* (1893); D. C. Thomson, *The Barbizon School of Painters* (London, 1890); W. Gensel, *Corot und Troyon* (Leipzig, 1906).

TRÜBNER, WILHELM (1851–1917), German painter, was born at Heidelberg on Feb. 3, 1851. He studied at Karlsruhe, Stuttgart and afterwards with Diez at Munich, where he came under the influence of Leibl and the impressionist group. He did not, however, join this or any other group, but went his own independent way, although he too aimed at achieving the effect of light and air in his painting, and worked with broad strokes of the brush. For some years he made Munich his home. In 1896 he settled in Frankfurt and in 1903 was made professor at the Karlsruhe academy. He died at Karlsruhe on Dec. 21, 1917. Trübner's colour was always warm and rich, but from the Frankfurt period onward he adopted a more restricted scheme and relied on strong contrasts in place of the tender intermediate tones of his earlier days. He had an admirable sense of values and his landscapes are sometimes built up almost in the manner of Cézanne. His portraits were also particularly successful.

His landscapes include the series of Heidelberg landscapes (1889) with the "View from the Castle" (Darmstadt); those painted at Chiamsee, and the later series at Amorbach and the Neuburg (1913). Among his portraits are those of the artist Schuch (Berlin), of his son in armour, and of the "Boy with Mastiff" (Düsseldorf).

See Fritz Knapp, *Künstlerische Kultur des Abendlandes* III., pp. 330 *et seq.*

TRUCE OF GOD, an attempt of the Church in the middle ages to alleviate the evils of private warfare. The two measures which were adopted by the Church to remedy this evil—the *pax ecclesiae* or *Dei* and the *treuga* or *treva Dei*—are usually both referred to as the Truce of God, but they are distinct in character. The latter was a development of the former.

The *pax ecclesiae* is first heard of in the year 990 at three synods held in different parts of southern and central France—at Charroux, Narbonne and Puy. It enlisted the immediate support of the regular clergy, particularly the vigorous ongregation of Cluny, and of William V. of Aquitaine, the most pwerful lord of southern France, who urged its adoption at th councils of Limoges (994) and Poitiers (999). The peace derees of these various synods differed considerably in detail, but i general they forbade, under pain of excommunication, every ac of private warfare or violence against ecclesiastical buildings ad their environs, and against certain persons, such as clerics, pilrims, merchants, women and peasants, and against cattle and gricultural implements. With the opening of the 11th century, he *pax ecclesiae* spread over northern France and Burgundy, and diocesan leagues began to be organized for its maintenance. Tie bishop, or count, on whose lands the peace was violated was vsted with judicial power and was directed, in case he was himse unable to execute sentence, to summon to his assistance the la men and even the clerics of the diocese, all of whom were requird to take a solemn oath to observe and enforce the peace. At the council of Bourges (1038), the archbishop decreed that every Christian 15 years and over should take such an oath and enter the diocesan militia. The idea that peace is a divine institution sems to have given rise to a new name for the peace, the *pax Dei*, or peace of God.

The *treuga* or *treva Dei*, the prohibiton of every act of private warfare during certain days, goes back at least to the Synod of Elne (1027) which suspended all warfre from noon on Saturday till prime on Monday. Like the *pax ecclesiae* it found ardent champions in the regular clergy, especially in Odilo (962–1049), the fifth abbot of Cluny, and soon spread over all France. It penetrated Piedmont and Lombardy in 1041 and Normandy in 1042. By this time the truce extended from the Wednesday evening to the Monday morning in every week and also, in most places, lasted during the seasons of Lent and Advent, the three great vigils and feasts of the Blessed Virgin, and those of the 12 apostles and a few other saints. The *treuga Dei* was decreed for Flanders at the Synod of Thérouanne (1063) and was instituted in southern Italy in 1089, probaby through Norman influence. The bishop of Liége introduced it n Germany in 1082, and three years later a synod held at Mainz n the presence of the emperor Henry IV. extended it to the whole empire. It did not extend to England, where the strength of the monarchy made it unnecessary. The popes took its direction into their own hands towards the end of the 11th century; and the first decree of the Council of Clermont (1095), at which Urban II. preached the first crusade, proclaimed a weekly truce for all Christendom, adding a guarantee of safety to all who might take refuge at a wayside cross or at the plough. The Truce of God was reaffirmed by many councils, such as that held at Reims by Calixtus II. in 1119, and the Lateran councils of 1123, 1139 and 1179. When the *treuga Dei* reached its most extended form, scarcely one-fourth of the year remained for fighting, and even then the older canons relating to the *pax ecclesiae* remained in force. The means employed for its enforcement remained practically the same: spiritual penalties such as excommunication, special ecclesiastical tribunals, sworn leagues of peace, and assistance from the temporal power. The Council of Clermont prescribed that the oath of adherence to the truce be taken every three years by all men above the age of 12, whether noble, burgess, villein or serf. The results of these peace efforts were perhaps surprisingly mediocre, but it must be borne in mind that not only was the military organization of the diocese always very imperfect, but Continental feudalism, so long as it retained political power, was inherently hostile to the principle and practice of private peace. The Truce of God was most powerful in the 12th century, but with the 13th its influence waned as the kings gradually gained control over the nobles and substituted the king's peace for that of the Church.

TRUCK SYSTEM. The payment of the wages of workmen *kind*, or in any other way than the unconditional payment of money, a practice known as the "truck system." Sometimes the workman was paid with "portion of that which he has helped to produce," but the most usual form was to give the workman a whole or part of his wages in the shape of commodities ted to his needs. There was also a practice of paying in ney, but with an express or tacit understanding that the rkman should resort for such goods as he required to shops stores kept by his employer. The truck system led in many es to grave abuses and was made illegal in Great Britain by Truck Acts, under which wages must be paid in current coin the realm, without any stipulations as to the manner in which same shall be expended. (*See* LABOUR LEGISLATION.)

TRUFFLE, the name of several kinds of subterranean fungi the family Ascomycetes. (*See* FUNGI.) Truffles have been nous for their esculent qualities from classical times. Several re recognized by the ancient Greeks and Romans; Theophrastus (*c.* 300 B.C.) gives one of them a name which apparently ers to a common belief that truffles were produced by thunder. ny thought that they were amongst the most wonderful of all ngs in springing up and living without a root. There are merous references to truffles in classical writings and Coelius icius gives six recipes for cooking them.

The subterranean Ascomycetes are usually placed in two main oups, the Tuberales and the Plectascales, depending upon the ssession of fruit-bodies with or without an opening to the exior during development. The suggestion is that these have sen along parallel lines. A point of interest is that we also have derranean forms of similar external appearance in Phycomyes and Basidiomycetes.

The best-known genus of the Tuberales is *Tuber*, which is inly native to temperate regions. The different species range size from that of a pea to that of an orange. A section of a ung specimen shows a whitish homogeneous flesh which, as turity is approached, becomes a rich dark colour showing a hter "marbling." Microscopical examination reveals that the ma plates bearing the hymnium are thrown into elaborate ds (*venae internae*) whereas other plates of tissue which are ht-coloured, sterile and joined either directly or indirectly to exterior run between them (*venae externae*). This complied arrangement is reached by a series of advances which may traced in the allied genera. The spores of *Tuber* are large and usually not more than four in an ascus; in the same fruit-body range from one to four may usually be seen. These were the t ascospores to be observed; Tournefort described them in 10–11 and Micheli figured them in 1729. It was a common lief that they became truffles merely by enlargement, though mentation of the earth, exudations of branches and leaves, cretion of roots, gall production by insects were frequently garded as reasonable explanations of their formation. Truffles ncipally occur in open woodland on calcareous soil, being rare in absent from sandy soil and pastures. They are usually ociated with the roots of trees and are possibly mycorrhizal ngi.

The most valued truffle in French cookery is the Périgord ffle (*T. melanosporum*) which is said to have first gained vour towards the end of the 15th century. It is brownish black, ndish and covered with polygonal warts having a depression their summit; the flesh (*gleba*) is first white, then brownish y, and when mature becomes violaceous black, with white veins ving a brown margin. The odour is well-marked and not unasant. The main French truffières are in Périgord and the partment of Vaucluse, though truffles are gathered throughout arge part of France. The truffle industry is an important one d about one-third of the gatherings are now exported; foreign de began seriously about a century ago and before the World ar reached to as much as £3,000,000 annually. As the truffles en occur at the depth of a foot it is difficult to detect them aided. Truffles, when occurring near the surface of the ground, ack it as they reach full size and experienced gatherers are ereby enabled to locate them. Further, many species of fly live on truffles and in the morning and evening columns of small yellow flies (*Helomiza lineata*, etc.) may be seen hovering over the place where truffles are present.

Occasionally man is sufficiently "susceptible" to the scent of truffles to be able to locate them. Several kinds of animals, however, recognize the scent without difficulty. Truffle hunting is therefore carried on with their aid; pigs and dogs being generally used, though goats are said to be so trained in Sardinia.

The truffle industry has proved so profitable in France that the government has taken in hand the reforesting of many large and barren areas, for many of the best truffle regions have become productive by the private planting of the appropriate trees. These are oaks (*Quercus coccifera, Q. Ilex* with admixture of *Q. robur, Q. sessiliflora* and hazel); "si voulez des truffes, semez des glands" is an adage which has been handed on for generations. Direct attempts at cultivation have so far proved unsatisfactory. Calcareous ground is dug over and acorns or seedlings planted. Soil from truffle areas is usually spread about and the ground is kept in condition by light ploughing and harrowing. After three years clearings are made and the trees are pruned. Truffles if they are to appear do so only after five years or so; gathering begins then but it hardly pays until after from eight to ten years. The yield is at its maximum from five to twenty-five years later. *Tuber melanosporum* has not been recorded for England.

The English truffle is *T. aestivum* which is found principally in beech woods. It is bluish black, roundish and covered with coarse polygonal warts; the gleba is white when immature, then ochraceous and finally brownish with whitish, branched, labyrinthine markings. It was formerly hunted on the south downs by the aid of mongrel terriers and was sold in Covent Garden. (J. RM.)

TRUJILLO or **TRUXILLO,** a seaport on the Atlantic coast of Honduras, in 15° 54′ N. and 86° 5′ W. Pop. (1925) about 2,000. The harbour, an inlet of the Bay of Honduras, is sheltered on the north by the promontory of Cape Honduras; it is deep and spacious, but insecure in westerly winds. Mahogany, dyewoods, sarsaparilla, cattle, hides and fruit are exported; grain, flour, hardware and rum are imported. Trujillo was founded in 1524, and became one of the most prosperous ports of the new world, and the headquarters of a Spanish naval squadron. During the 17th century it was frequently and successfully raided by buccaneers, and thus lost much of its commerce, which still more, in modern times, has been diverted to Puerto Cortés and to Puerto Castilla, across the bay.

TRUJILLO, the capital and prefectural seat of the Department of La Libertad, in Peru, lies in lat. 8° 7′ S. and long. 79° 9′ W., some 300 miles up the coast and north of Lima, the capital. It is the second city in Peru in point of age, having been founded by Pizarro and his followers in the year 1537; and the third city in point of population, having approximately 40,000 inhabitants and only exceeded by Lima and Arequipa. It is 8 m. by rail from Salaverry, its port on the Pacific ocean, and 4 m. from the coast at its nearest point.

Trujillo serves the important mining region of Quiruvilca (copper) and Milluachaqui (gold and silver) which is now being exploited by the Northern Peru Mining and Smelting Company, a subsidiary of the American Smelting and Refining Company of New York, and growing quantities of bar-copper, gold and silver ores, concentrates and precipitates are being shipped. It also serves two agricultural districts, that of the Valley of the River Moche and of the Valley of the Chicama, the last named being probably the most important sugar-cane growing district of Peru. Much of the traffic that formerly passed through Trujillo from the Chicama valley is now being diverted to the port of Malabrigo or, as it is now called, Puerto Chicama.

Though lying in the tropics, geographically, the climate is distinctly temperate due to the Humbolt current that sweeps up the west coast of South America from the Antarctic ocean to Punta Pariña, Peru, where it flows out to sea, the average temperature of this current being about 60° F. An extended observation of meteorological conditions at Trujillo shows a maximum temperature of 85° F and a minimum of 55°, the mean variation between diurnal and nocturnal extremes being 10 degrees. The

region is practically rainless and agriculture is carried on by irrigation from rains high up in the Andes which closely hug the coastline. Light rains occur at cycles of seven years and of greater importance at cycles of 31 years. One such period occurred in March 1925, when, between March 7 and the end of that month 15·5 in. of rain fell, ten times more than the total rainfall for the seven year period 1918–24 inclusive. These rains caused great damage to Trujillo and neighbouring towns and many houses were demolished and many people left homeless in a country where no provision for protection against rain exists.

Trujillo is served by a narrow-gauge railway line that connects it with its port—Salaverry—with a branch to Menocucho in the Moche valley, and a line to Ascope in the Chicama valley. The city is the centre of a very rich and exceedingly interesting region from an anthropological and archaeological point of view; the ruined and deserted pre-Inca city, Chan-Chan, the capital of a civilization known variously as the Chimu, Mochica or Yunga, lies close by, and the Chicama valley, the lower Moche valley and the Valley of the River Viru are rich in remains of civilizations believed even to antedate that of the Yungas. Trujillo is approximately 22 hr. by steamer from Callao, the port for Lima.

(O. Ho.)

TRUJILLO, a town of Spain, in the province of Cáceres; on a hill 25 m. east of Cáceres, and on the Tozo river, a subtributary of the Tagus. Pop. (1920), 11,476. Trujillo was a town of importance in the middle ages. Pizarro, the conqueror of Peru, was born here about 1471, and his palace still stands. In the oldest part of Trujillo are the remains of a castle said to be of Roman origin. The Julia tower is also said to be Roman. The Roman name for the town was Turgalium.

TRUMAIAN, a small group of tribes of South American Indians, constituting an independent linguistic stock. The Trumai live on the headwaters of the Xingu river in the State of Matto Grosso, Brazil.

See K. von den Steinen, *Durch Zentral Brasilien* (Leipzig, 1886) and *Unter den Naturvölkern Zentral Brasilien* (Berlin, 1894).

TRUMBIĆ, ANTE (1863–), Yugoslav statesman, was born at Split. He became successively mayor of Split, and deputy for the city in the Dalmatian Diet, and after 1907 deputy in the Austrian Parliament. In 1905 he and his fellow Dalmatians, Pero Čingrija, Smodlaka and Supilo, as delegates of the Croat National party, worked for the renewed co-operation between Serb and Croat, which culminated in the resolutions of Fiume and Zara in 1905, and in the parallel negotiations with the Magyar coalition parties. The programme of reform in Croatia, which was the basis of the agreement with Hungary, was soon frustrated by the intransigent attitude of the Wekerle Government. The Dalmatian Croats, notably Trumbić and Supilo, consistently endeavoured to improve their relations with the Italians and to combat the constant efforts of Vienna to set the two races at variance.

On the eve of the World War Trumbić crossed the frontier to Venice, where he was joined by Supilo and several other Croat and Serb leaders. The first winter of the war he spent in Rome, hoping to win Italian official support. But Sonnino's anti-Slav policy and the secret agreement concluded between Italy and the Entente at the expense of the Yugoslavs in the spring of 1915, forced him to transfer his centre of operations to France and England. The Yugoslav committee, of which Trumbić was president, was formally constituted in May 1915 in London. In the summer of 1917 he and others negotiated with the exiled Serbian government in Corfu and representatives of all the Serbian parties, the so-called "Declaration of Corfu," which provided the basis for a united Yugoslav State. Trumbić met representative Italians in Dec. 1917 and March 1918, and shared in the arrangements for the congress of oppressed nationalities, held in Rome in April. In Oct. 1918 Trumbić was appointed foreign minister in the Yugoslav provisional government and peace delegate in conjunction with Pašic and Vesnić. He was unable to win support for Yugoslav claims from the Entente, which considered itself still bound to Italy by the secret Treaty of London. The Yugoslavs were obliged to come to a direct agreement with Italy, and the Treaty of Rapallo was signed in Nov. 1920.

Trumbić's long absence in Paris, coupled with the policy of abstention pursued by the Croat Peasant party under Radić, placed him at a fatal disadvantage when the question of the new constitution came up in 1921. Trumbić voted in the minority and thereafter drifted steadily into stronger opposition to the new régime in Yugoslavia. His group formed part of the coalition "bloc" which was in power from July to Oct. 1924, and for a time he effected a working alliance with Radić and committed himself to federalism and even republicanism. The sudden *volte face* of Radić after the elections of 1925 left Trumbić somewhat isolated, as the leader of the newly constituted "Croat Federalist Peasant party."

TRUMBULL, JOHN (1750–1831), American poet, was born in what is now Watertown, Conn., where his father was a Congregational preacher, on April 24, 1750. At the age of seven he passed his entrance examinations to Yale, but did not enter until 1763; he graduated in 1767, remained at the college studying, and in 1771–73 was a tutor. He spent a year in Boston in the office of John Adams, and after 1774 practised law in Connecticut. He was State's Attorney in 1789, a member of the Connecticut assembly in 1792 and 1800, a judge of the superior court in 1801–19, and finally a judge in the supreme court of errors. The last six years of his life were spent in Detroit, Mich., where he died on May 10, 1831. While studying at Yale he had contributed in 1769–70 ten essays, called "The Meddler," imitating *The Spectator,* to the *Boston Chronicle,* and in 1770 similar essays, signed "The Correspondent" to the *Connecticut Journal* and *New Haven Post Boy.* While a tutor he wrote his first satire in verse, *The Progress of Dulness* (1772–73), an attack in three poems on educational methods of his time. His great poem, which ranks him with Philip Freneau and Francis Hopkinson as an American political satirist of the period of the Revolutionary War, was *M'Fingal,* of which the first canto, "The Town Meeting," appeared in 1776 (dated 1775). This canto, about 1,500 lines, contains some verses from "Gage's Proclamation," published in the *Connecticut Courant* for Aug. 1775; it portrays a Scotch Loyalist, M'Fingal, and his Whig opponent, Honorius, apparently a portrait of John Adams. This first canto was divided into two, and with a third and a fourth canto was published in 1782. After the war Trumbull was a rigid Federalist, and with the "Hartford Wits," David Humphreys, Joel Barlow and Lemuel Hopkins, wrote the *Anarchiad,* a poem directed against the enemies of a firm central government.

See the memoir in the Hartford edition of Trumbull's *Poetical Works* (1820); J. H. Trumbull, *The Origin of "McFingal"* (Morrisania, New York, 1868); and the estimate in M. C. Tyler's *Literary History of the American Revolution* (New York, 1897).

TRUMBULL, JOHN (1756–1843), American artist, was born at Lebanon (Conn.), on June 6, 1756, the son of Jonathan Trumbull (1710–1785), governor of Connecticut. He graduated at Harvard in 1773, served in the War of Independence, rendering a particular service at Boston by sketching plans of the British works, and was appointed second aide-de-camp to Gen. Washington and in June 1776, deputy adjutant general to Gen. Gates, but resigned from the army in 1777. In 1780 he went to London to study under Benjamin West, but his work had hardly begun when the news of the arrest and execution of Major André, who was deputy adjutant general in the English army, suggested the arrest of Trumbull as having been an officer of similar rank in the Continental army; he was imprisoned for seven months. In 1784 he was again in London working under West, in whose studio he painted his "Battle of Bunker Hill" and "Death of Montgomery," both of which are in the Yale School of Fine Arts.

In 1785 Trumbull went to Paris, where he made portrait sketches of French officers for "The Surrender of Cornwallis," and began, with the assistance of Jefferson, "The Signing of the Declaration of Independence," well-known from the engraving by Asher B. Durand. These paintings, with "The Surrender of

oyne" and "The Resignation of Washington," were bought he United States Government and placed in the Capitol at ington. Trumbull's "Sortie from Gibraltar" (1787), owned ie Boston Athenaeum, is now in the Boston Museum of Fine and a series of historical paintings, the "Trumbull Gallery," ar the largest single collection of his works (more than 50 ires), has been in the possession of Yale college since 1831, Trumbull received from the college an annuity of $1,000. is portraits include full lengths of Gen. Washington (1790) George Clinton (1791), in the City Hall of New York—e there are also full lengths of Hamilton and of Jay; and aits of John Adams (1797), Jonathan Trumbull, and Rufus (1800); of Timothy Dwight and Stephen Van Rensselaer, at Yale; of Alexander Hamilton (in the Metropolitan eum of Art, New York city, and in the Boston Museum of Arts, both taken from Ceracchi's bust); a portrait of him-painted in 1833; a full length of Washington, at Charleston, h Carolina; a full length of Washington in military costume 2), now at Yale; and portraits of President and Mrs. Wash-on (1794), in the National Museum at Washington. Trum-s own portrait was painted by Stuart and by many others. e died in New York on Nov. 10, 1843.

e his *Autobiography* (1841); J. F. Weir, *John Trumbull, A brief ch of His Life, to which is added a Catalogue of his Works* (1901); John Durand, "John Trumbull," *American Art Review*, vol. ii., pp. 181–191 (Boston, 1881).

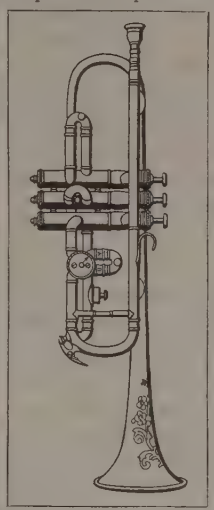
RUMBULL, JONATHAN (1710–1785), American po-l leader, was born at Lebanon (Conn.), on Oct. 12, 1710. He uated at Harvard in 1727, and began the study of theology, n 1731 engaged in business with his father. He next studied was elected to the assembly in 1773, and held public office st continuously afterward. He served for seven years in the mbly, being speaker for three years; for 17 years as county e of Windham county, for 22 years (after 1740) as governor's tant, for two years as deputy-governor (1767–69), and for e years (1766–69) as chief justice of the colony. In 1769 he elected governor and continued in office until his voluntary ement in 1784. During the War of Independence he was a ed counsellor of Washington. The story that the term ther Jonathan," a sobriquet for the United States, originated Washington's familiar form of addressing him seems to be out any foundation. After the war Trumbull was a strong eralist. He died in Lebanon on Aug. 17, 1785.

s public papers have been printed in the Massachusetts Historical ty's *Collections*, 5th series, vols. ix., x. (Boston, 1885–88), and series, vols. ii., iii. (1902). *See* I. W. Stuart, *Life of Jonathan nbull, sen.* (Boston, 1859).

RUMPER, VICTOR (1877–1915), Australian cricketer, born at Sydney, N.S.W., on Nov. 2, 1877, and died there of ht's disease on June 28, 1915. His first appearance against and was in a second-class match against Stoddart's team in –95. In 20 seasons of first-class cricket, 1894–1914, he made 00 runs for an average of 45. His first visit to England, in , was moderately successful; his next, in 1902, was a tri-hal progress. "From start to finish of the season, on every of wicket, against every type of bowling, Trumper entranced eye, inspired his side, demoralized his enemies, and made getting appear the easiest thing in the world" (H. S. Altham, *ory of Cricket*). It was apparent at once that there had en a batsman of a class apart, whose supremacy, even in that en age of batting, was comparable to that of "W.G." He e again in 1905, and 1910; in all he made six centuries for tralia against England, and his first wicket partnerships with A. Duff were long a thorn in England's side. Trumper was a fine out-field, and could bowl fast for a short time. Trump-batting was of that supreme type which defies description. only adequate idea of his style is to be derived from a derful series of photographs in Beldam and Fry's *Great smen* (1905). With his accurate timing and placing, and his d on his feet, he had all bowlers at his mercy. "No one played so naturally," Warner has said of him, "batting was part of himself." He had a charming personality and was the most beloved of cricketers. Perhaps the best tribute to his greatness is that every new batsman of high promise in Australia is hailed as "a second Trumper."

See M. A. Noble, *The Game's the Thing* (London and Australia, 1926); *Scores and Biographies*, vol. xv. (1925).

TRUMPET, in music, a brass wind instrument with cup-shaped mouthpiece and a very characteristic tone. It consists of a brass or silver tube with a narrow cylindrical bore except for the bell joint, forming from $\frac{1}{3}$ to $\frac{1}{4}$ of the whole length, which is conical and terminates in a bell of moderate diameter. The tube of the trumpet is doubled round upon itself to form a long irregular rectangle with rounded corners. A tuning slide consisting of two U-shaped cylindrical tubes fitting into each other is interpolated between the bell joint and the long cylindrical joint to which the mouthpiece is attached.



BY COURTESY OF BOOSEY & CO., LONDON

THE TRUMPET, SHOWING THE MODERN FORM EQUIPPED WITH VALVES

The mouthpiece consists of a hemispherical cup with a rim across which the lips stretch. The shape of the cup, and more especially of the bottom, in which is pierced a hole communicating with the main bore, is of the greatest importance on account of its influence on the tone quality and on the production of the higher harmonics. It is recognized that the shallower and smaller the cup the more easily are the higher harmonics produced; the sharper the angle at the bottom of the cup the more brilliant and incisive is the timbre, given, of course, the correct style of blowing. The diameter of the cup varies according to the pitch and to the lip-power of the player who chooses a cup to suit him.

There are three principal kinds of trumpets: (1) the natural trumpet, mainly used in cavalry regiments, in which the length of the tube and pitch are varied by means of crooks; (2) the slide and double-slide trumpets, in which a chromatic compass is obtained, as in the trombone, by double tubes sliding upon one another without loss of air; (3) the valve trumpet, similar in its working to all other valve instruments. The first and second of these alone give the true trumpet timbre. The tone of the valve trumpet approximates to that of the cornet; nevertheless, it is now almost universally used.

In the trumpet the notes of the harmonic series from the 3rd to the 10th or 16th upper partials are produced by the varied tension of the lips and pressure of breath called overblowing. The fundamental and the second harmonic are rarely obtainable, and are therefore left out of consideration; the next octave from the 4th to the 8th harmonics contains only the 3rd, 5th and minor 7th, and is therefore mainly suitable for fanfare figures based on the common chord. The diatonic octave is the highest and its upper notes are only reached by very good players on trumpets of medium pitch.

The lituus (*q.v.*) or cavalry trumpet of the Romans seems to have vanished with the fall of the Roman empire. Its successor, the cavalry trumpet of the 15th and succeeding centuries, was evolved from the straight *busine*, an instrument traced, by means of its name no less than by the delicate proportions of its tube and the shape of the bell, to the Roman buccina (*q.v.*). The bending of the tube of the trumpet in three parallel branches, thus creating its modern form, has usually been claimed for a Frenchman named Maurin (1498–1515). But the transformation was really made much earlier, probably in the Low Countries or north Italy; in any case it had already been accomplished in the bas-reliefs of Luca della Robbia intended to ornament the organ chamber of the cathedral of Florence where a trumpet having the tube bent back as just described is very distinctly figured. And this shape the instrument retained for more than 300 years.

Later crooks and slides were introduced, then keys, and finally

in 1815, Stölzel made the first completely satisfactory chromatic trumpet by the invention of the ventil or piston. (*See* MOUTHPIECE; VALVE; and WIND INSTRUMENTS.)

TRUMPETER or **TRUMPET-BIRD,** a South American bird of the *Psophiidae* family, so called from the sound it utters. The family contains the single genus *Psophia* with half-a-dozen species, differing in little but colour and size. The range of several species seems to be separated by rivers (Wallace, *Geogr. Distr. Animals*) and in this connexion it may be observed that the birds seldom fly, though they run very fast. The best known species, *P. crepitans,* inhabits Guiana and is about the size of a large barn-door fowl, but with longer legs and neck. The plumage is black with the exception of the green and violet reflections on the tips of the neck-feathers and a brown and grey patch on the back. The legs are bright green and the bird lays white eggs, about the size of a bantam's egg.

Although the trumpeters must undoubtedly be accorded the rank of a distinct family, *Psophiidae,* like so many other South American birds they seem to be the less specialized descendants of an ancient generalized group—perhaps the common ancestors of the *Rallidae* and *Gruidae.* The structure of the trachea, though different from that described in any Crane (*q.v.*), suggests an early form of the structure which in some of the *Gruidae* is so marvellously developed, for in *Psophia* the windpipe runs down the breast and belly immediately under the skin to within about an inch of the anus, whence it returns in a similar way to the front of the sternum, and then enters the thorax. Analogous instances of this formation occur in several other groups of birds not at all allied to the *Psophiidae.*

TRUNK (Fr. *tronc,* Lat. *truncus,* cut off, maimed), properly the main stem of a tree from which the branches spring, especially the stem when stripped of the branches; hence, in a transferred sense, the main part of a human or animal body without the head, arms or legs. It is from this last sense that the term "trunk-hose" is derived. These were part of the typical male costume of the 16th century, consisting of a pair of large puffed and slashed over-hose, reaching from the waist to the middle of the thigh, the legs clad in the long hose being thrust through them; the upper part of the body was covered by the jerkin or jacket reaching to the thigh (*see* COSTUME). The word "trunk" as applied to the elongated proboscis of the elephant is due to a mistaken confusion of French *trompe,* trump, with "trunk," meaning the hollow stem of a tree. A somewhat obscure meaning of French *tronc, i.e.,* an alms-box, has given rise to the general use of "trunk" for a form of travellers' luggage.

TRURO, THOMAS WILDE, 1ST BARON (1782–1855), lord chancellor of England, was born in London on the 7th of July 1782, being the second son of Thomas Wilde, an attorney. He was educated at St. Paul's School and was admitted an attorney in 1805. He subsequently entered the Inner Temple and was called to the bar in 1817, having practised for two years before as a special pleader. Retained for the defence of Queen Caroline in 1820 he distinguished himself by his cross-examination and laid the foundation of an extensive common law practice. He first entered parliament in the Whig interest as member for Newark (1831–1832 and 1835–1841), afterwards representing Worcester (1841–1846). He was appointed solicitor-general in 1839, and became attorney-general in succession to Sir John (afterwards Baron) Campbell in 1841. In 1846 he was appointed chief justice of the common pleas, an office he held until 1850, when he became lord chancellor, and was created Baron Truro of Bowes, Middlesex. He held this latter office until the fall of the ministry in 1852. He died in London on the 11th of November 1855. His son Charles (1816–1891) succeeded as 2nd baron, but on the death of his nephew the 3rd baron in 1899 the title became extinct.

Lord Truro was the uncle of JAMES PLAISTED WILDE, BARON PENZANCE (1816–1899), who was appointed a baron of the court of exchequer in 1860, and was judge of the court of probate and divorce from 1863 to 1872. In 1875 he was appointed dean of the court of arches, retiring in 1899. He was created a peer in 1869, but died without issue, and the title became extinct.

TRURO, an episcopal city and municipal borough of Cornwall, England, 11¾ m. N. of Falmouth, on the G.W.R. Pop. (192 10,843. It lies in a shallow valley at the junction of the Kenw and Allen at the head of Falmouth harbour. Truro (Truer Treurok, Treueru) was a comparatively small manor in Dom day held by Jovin of Count Robert of Mortain. Its municip charter dates from Richard Lucy the chief justiciar who held demesne lands. Reginald earl of Cornwall, by an undated chart added other privileges. Henry II. confirmed them. A new char was given in 1589. From 1295 to 1885 Truro had separate parl mentary representation, returning two members. The cathed church of St. Mary was begun in Early English style in 18 The episcopal see, founded in 1876, covers the former ar deaconry of Cornwall in the diocese of Exeter; the area includ the whole of the county of Cornwall, with a small portion Devonshire. There are tin-smelting works and potteries. Sm vessels can lie at the quays, though the harbour is dry at l water. China clay is the chief export.

TRURO, the chief town of Colchester county, Nova Scot on the Salmon river, near the head of Cobequid Bay, 61 m. fr Halifax by rail. Pop. (1921), 7,562. It is an important junct on the Canadian National and Dominion Atlantic railways, a the thriving centre of a lumbering and agricultural district.

TRUSS, in engineering and architecture, a combination structural members, usually straight, and so arranged in one pla that by being connected at their ends they form a rigid frame which to support a roof, floor, bridge or other similar weig In the theoretically perfect truss the component parts are designed as to enclose between themselves rigid triangles a so arranged that every member is stressed only in the dir tion of its own length, either in compression or tension, with bending forces present. This, the controlling ideal of mode truss design, governs in the design of those trusses which a purely structural, or designed primarily from the utilitari standpoint. In ordinary architectural practice the exigencies individual building problems, or the demands of aesthetic eff frequently render complete following out of the engineeri theory impractical, and in one important class of architectu trusses, the hammerbeam (*q.v.*) trusses, considerable side thru is exerted upon the supporting walls or piers. Although the ba principle of truss design, that of the rigidity of a triangle, is simple, the scientific design of trusses is a matter of comparative recent development; and in the greater number of classic, Roma esque and Gothic trusses, despite the ingenuity of their constru tion and, especially in late Gothic work, the beauty of th design and execution, it is only rarely, and as it were by accide that a perfect triangulation of the members is achieved.

A truss diagram is a graphic method of discovering the stress in the component members of a truss, based upon the mechani theory of the resolution of two angular forces into the diagon of the parallelogram constructed upon them. (*See* BRIDGE MECHANICS; ROOFS.)

TRUST, INVESTMENT: *see* INVESTMENT TRUST.

TRUST and **TRUSTEES.** *Use in Early English Law.*—T use or trust is said to have been the invention of ecclesiasti well acquainted with Roman law, the object being to esca the provisions of the laws against mortmain by obtaining t conveyance of an estate to a friend on the understanding th they should retain the use, *i.e.,* the actual profit and enjoyme of the estate. Uses were soon extended to other purpose They were found valuable for the defeat of creditors, avoi ing of attainder and charging of portions. A use had al the advantage of being free from the incidents of feudal te ure; it could be alienated *inter vivos* by secret conveyanc and could be devised by will. In 1535 the famous Statute Uses (27 Hen. VIII. *c.* 10) was passed, forming the basis of co veyancing until it was repealed in 1925 by the Law of Proper Act. The statute does not, however, apply indiscriminately all cases, as only certain uses are executed by it. It does n apply to leaseholds or copyholds, or to cases where the grant to uses is anything more than a mere passive instrument, *e.* where there is any direction to him to sell the property. Th

city of transfer, which it was the special object of the te of Uses to effect, was almost at once defeated.

usts.—A trust in English law is defined in Lewin's *Law of s*, adopting Coke's definition of a use, as "a confidence re- l in some other, not issuing out of the land, but as a thing eral, annexed in privity to the estate of the land, and to the n touching the land, for which *cestui que trust* has no remedy y *subpoena* in Chancery." The term *trust* or *trust estate* is used to denote the beneficial interest of the cestui que trust. ist has some features in common with contract (*q.v.*); but reat difference between them is that a contract can only be ced by a party or one in the position of a party to it, while st can be, and generally is, enforced by one not a party to its ion. A division often adopted in modern textbooks and rec- ed by parliament in the Trustee Act 1850, is into *express, im-* and *constructive*. An express trust is determined by the n creating it. It may be either *executed* or *executory*, the er where the limitations of the equitable interest are complete final, the latter where such limitations are intended to serve ly as minutes for perfecting the settlement at some future d, as in the case of marriage articles drawn up as a basis marriage settlement to be in conformity with them. An im- trust is founded upon the intention of the person creating xamples of it are a resulting trust, a precatory trust, and the held by the vendor on behalf of the purchaser of an estate contract and before conveyance. A constructive trust is ially created from a consideration of a person's conduct in r to satisfy the demands of justice, without reference to inten- The law was consolidated by the Trustee Act 1893 and some equent amending statutes as the Law of Property Act,

ho May Be a Trustee or *Cestui que Trust.*—The Crown and orations aggregate can be trustees. Provision is made by the icipal Corporations Act 1882, for the administration of chari- e and special trusts by municipal corporations. There are in persons who for obvious reasons, even if not legally dis- ified, ought not to be appointed trustees. Such are infants, tics, persons domiciled abroad, felons, bankrupts and *cestuis trustent*. Any one may be a cestui que trust except a corpo- n aggregate, which cannot be a cestui que trust of real estate out a licence from the Crown. For the Public Trustee, *see* w. The disabilities affecting some Roman Catholic charities e abolished by the Roman Catholic Relief Act 1926.

reation and Extinction of the Trust.—A trust may be cre- either by act of a party or by operation of law. The Statute rauds altered the common law by enacting that all declara- s or creations of trusts or confidences of any lands, tenements ereditaments shall be manifested and proved by some writing, ed by the party who is by law enabled to declare such trust, or is last will in writing, or else they shall be utterly void and one effect. For the purpose of conveying or creating a legal te they must be made by deed (Law of Property Act, 1925,). Interests created by parol are by will only (s. 54). Trusts ng or resulting by implication or construction of law are pted, and it has been held that the statute applies only to estate and chattels real, so that a trust of personal chattels still be declared by parol. The declaration of a trust by the wn must be by letters patent. Trusts created by will must form to the requirements of the Will Act. (*See* WILL.) Except he case of charitable trusts, the cestui que trust must be a nite person. A trust, for instance, merely for keeping up family bs is void. By s. 10 of the Trustee Act 1893 (superseding d St. Leonards's Act of 1860 and the Conveyancing Act 1), the surviving or continuing trustee or trustees, or the sonal representative of the last surviving or continuing trus- may nominate in writing a new trustee or new trustees. On n appointment the number of trustees may be increased. sting trustees may by deed consent to the discharge of rustee wishing to retire. Trust property may be vested in or continuing trustees by a simple declaration to that ef- Also a separate set of trustees may be appointed for any t of the property held on distinct trusts. Trusts created by operation of law are those which are the effect of the application of rules of equity. They include resulting and constructive trusts. A resulting trust is a species of implied trust, and consists of so much of the equitable interest as is undisposed of by the instrument creating the trust, which is said to result to the creator and his representatives. An example is the purchase of an estate in the name of the purchaser and others, or of others only. Here the beneficial interest is the purchaser's. An example of a constructive trust is a renewal of a lease by a trustee in his own name, where the trustee is held to be constructively a trustee for those interested in the beneficial term. Besides being duly created, it is necessary for the validity of the trust that it should be a lawful one. An unlawful trust is one which contravenes the policy of the law in any respect. Examples of such trusts are trusts for a corporation without licence, for a perpetuity, and for purposes subversive of morality, such as trusts for illegitimate children to be hereafter born. Superstitious uses also fall under this head. There are also certain trusts which are avoided by statute under particular circumstances, such as settlements in fraud of creditors. (*See* BANKRUPTCY.) The law cannot be evaded by attempting to constitute a secret trust for an unlawful purpose. If an estate be devised by words prima facie carrying the beneficial interest, with an understanding that the devisee will hold the estate in trust for such a purpose, he may be compelled to answer as to the secret trust, and on acknowledgment or proof of it there will be a resulting trust to the heir-at-law. In the case of an advowson suspected to be held for the benefit of a Roman Catholic patron, there is a special enactment to the same effect. (*See* QUARE IMPEDIT.) The rules of equity in charitable trusts are less strict than those adopted in private trusts. Charitable trusts must be lawful, *e.g.*, they must not contravene the Statutes of Mortmain; but a wider latitude of construction is allowed in order to carry out the intentions of the founder, and they will not be allowed to fail for want or uncertainty of objects to be benefited. The court, applying the doctrine of *cy près* (*q.v.*), will, on failure of the original ground of the charity, apply the funds as nearly as possible in the same manner. On this principle gifts originally made for purely charitable purposes have been extended to educational purposes. Further, trustees of a charity may act by a majority, but ordinary trustees cannot by the act of a majority (unless specially empowered so to do) bind a dissenting minority or the trust property. A trust estate is subject as far as possible to the rules of law applicable to a legal estate of a corresponding nature, in pursuance of the maxim, "Equity follows the law." Thus trust property as assets for payment of debts, may be taken in execution, passes to creditors in bankruptcy, and is subject to dower and curtesy, to the rules against perpetuities, and to the Statutes of Limitation. A trust is extinguished, as it is created, either by act of a party or by operation of law. An example of the former mode of extinction is a release by deed, the general means of discharge of a trustee when the purposes of the trust have been accomplished. Extinction by operation of law takes place when there is a failure of the objects of the trust: *e.g.*, if the cestui que trust die intestate without heirs or next of kin. Equitable interests in real estate in other countries are as a rule subject to the *lex loci rei sitae*, and an English court has no jurisdiction to enforce a trust or settle a scheme for the administration of a charity in a foreign country. An English court has, however, jurisdiction to administer the trusts of a will as to the whole real and personal estate of a testator, even though only a very small part of the estate, and that wholly personal, is in England. (See *Ewing* v. *Orr-Ewing*, L.R. 9, A.C. 34.)

Rights and Duties of the Trustee.—The principal general properties of the office of trustee are these: (1) A trustee having once accepted the trust cannot afterwards renounce. (2) He cannot delegate it, but an inconvenience which formerly attached to dealings with trustees and trust property, in consequence partly of this rule, and partly of the liability of persons dealing with trustees to see that money paid to them was properly applied, was largely obviated by s. 17 of the Trustee Act 1893 (replacing s. 2 of the Trustee Act 1888), which in effect provides that a trustee may appoint a solicitor to be his agent to receive and give a discharge

for any money or valuable consideration or property receivable by the trustee under the trust, by permitting the solicitor to have the custody of and to produce a deed having in the body thereof or endorsed thereon a receipt for the consideration money or other consideration, the deed being executed or the endorsed receipt being signed by the trustee; and a trustee is not chargeable with breach of trust by reason only of his having made or concurred in making any such appointment; and the producing of any such deed by the solicitor is a sufficient authority to the person liable to pay for his paying to the solicitor without the solicitor producing any separate or other direction or authority in that behalf from the trustee. (3) In the case of co-trustees the office must be exercised by all the trustees jointly. (4) On the death of one trustee there is survivorship: that is, the trust will pass to the survivors or survivor. (5) One trustee shall not be liable for the acts of his co-trustee. (6) A trustee shall derive no personal benefit from the trusteeship. The office cannot be renounced or delegated, because it is one of personal confidence. It can, however, be resigned, and legislation has given a retiring trustee large powers of appointing a successor. The liability of one trustee for the acts or defaults of another often raises very difficult questions. A difference is made between trustees and executors. An executor is liable for joining in a receipt *pro forma*, as it is not necessary for him to do so, one executor having authority to act without his co-executor; a trustee can show that he only joined for conformity, and that another received the money. The rule of equity by which a beneficiary who consented to a breach of trust was liable to indemnify the trustees to the extent of his interest has taken definite statutory shape in s. 45 of the Trustee Act 1893 (replacing s. 6 of the Trustee Act 1888), which enacts that when a trustee commits a breach of trust at the instigation or request, or with the consent in writing of a beneficiary, the High Court may, if it thinks fit, and notwithstanding that the beneficiary is a married woman entitled for her separate use and restrained from anticipation, make such order as to the court seems just for impounding all or any part of the interest of the beneficiary in the trust estate by way of indemnity to the trustee. The rule that a trustee is not to benefit by his office is subject to some exceptions. He may do so if the instrument creating him trustee specially allows him remuneration, as is usually the case where a solicitor is appointed. The main duties of trustees are to place the trust property in a proper state of security, to keep it (if personalty) in safe custody, and properly to invest and distribute it. A trustee must be careful not to place himself in a position where his interest might clash with his duty. As a rule he cannot safely purchase from his cestui que trust while the fiduciary relation exists between them. Investments by trustees demand special notice. The Trustee Act, 1925, has consolidated the law on this point, and provides, as it were, a code or charter of investment authorizing trustees, unless expressly forbidden by the instrument (if any) creating the trust, to invest trust funds in various modes, of which the more important are as follows: In any of the parliamentary stocks or public funds or government securities of the United Kingdom; in real or heritable securities in Great Britain; in stock of the Bank of England or the Bank of Ireland; in India 7, 5½, 4½, 3½, 3 and 2½ stock; in any securities, the interest of which is for the time being guaranteed by parliament; in consolidated stock created by the Metropolitan Board of Works, the London County Council; debenture stock created by the Receiver for the Metropolitan Police District, Metropolitan Water stock; in the debenture or rent-charge or guaranteed or preference stock of any railway company in the United Kingdom incorporated by special act of parliament, and having during each of the ten years last past before the date of investment paid a dividend at the rate of not less than 3% on its ordinary stock and in certain other railway or canal stocks; in the debenture stock of any railway company in India, the interest on which is paid or guaranteed by the secretary of state in council of India; in the "B" annuities of the Eastern Bengal, the East Indian and the Sindh, Punjaub and Delhi Great Indian Peninsula and Madras Railways, etc.; and also in deferred annuities—comprised in the register of holders of annuity Class D, and annuities comprised in the register of annuitants Class C of the East India Railway Company; in the stock of any railway company in India upon which a fixed or minimum dividend in sterling is paid or guaranteed by the secretary of state in council of India, or upon the capital of which the interest is so guaranteed; in the debenture or guaranteed or preference stock of any company in Great Britain or Ireland established for the supply of water for profit and incorporated by special act of parliament or by royal charter and having during each of the ten years last past before the date of investment paid a dividend of not less than 5% per annum on its ordinary stock; in nominal or inscribed stock issued, or to be issued under any Act of Parliament or provisional order by the corporation of any municipal borough in the United Kingdom having, according to the returns of the last census prior to the date of investment, a population exceeding 50,000; or by any county council in the United Kingdom in certain water stocks; in securities authorized under the Colonial Stock Act, 1900, etc.; the Housing (Additional Powers) Act, 1919; loan securities issued by the Government of Northern Ireland; in any of the stocks, funds or securities for the time being authorized for the investment of cash under the control or subject to the order of the High Court. Trustees may from time to time vary any such investments for others of an authorized nature. The statutory power to invest on real securities does not, of course, authorize the purchase of realty; but by s. 5 of the Trustee Act 1893 a power to invest in real securities (in the absence of express provision to the contrary) authorizes investment on mortgage of leasehold property held for an unexpired term of not less than 200 years and not subject to a greater rent than one shilling a year, or to any right of redemption or condition of re-entry except for non-payment of rent. The Trustee Act 1925 must be consulted for full information.

The position of trustees in respect of what was frequently an undue personal responsibility for the administration of their trust has been much improved by s. 8 of the Trustee Act 1888 which enables an honest trustee to plead the Statutes of Limitation. It has been decided that in the case of a breach of trust consisting of an improper investment of the trust funds, time begins to run in favour of the trustee from the date of the investment. Sub-section (3) of the Judicial Trustees Act 1896 gives power to the Court further to relieve honest trustees for breaches of trust.

Under the old law trustees could not safely advance on mortgage more than two-thirds of the actual value of agricultural land or one-half of the value of houses. This "two-thirds rule" is now made statutory by s. 8 of the Trustee Act 1893. The same section protects trustees for not investigating the lessor's title when lending on the leasehold security, and for taking a shorter title than they might be otherwise entitled to on the purchase of mortgage of any property, if they act with prudence and caution. By s. 9 (replacing s. 5 of the Trustee Act 1888) trustees who commit a breach of trust by lending more than the proper amount on any property are excused from making good any more than the excess of the actual loan over the sum which they might have properly lent in the first instance. (*See* generally the Trustee Act 1925, for full information.)

Rights and Duties of the Cestui que Trust.—The cestui que trust has a general right to the due management of the trust property, to proper accounts and to enjoyment of the profits. He can as a rule only act with the concurrence of the trustee unless he seeks a remedy against the trustee himself.

Judicial Trustees.—The Judicial Trustees Act 1896, inaugurated a semi-official system of trusteeship which was new in England, but had been known in Scotland for upwards of 150 years.

Public Trustee.—A step further was taken by the Public Trustee Act 1906, which established the office of public trustee. By the act he is a corporation sole, with perpetual succession and an official seal and may sue and be sued under his official title. He may, if he thinks fit, act in the administration of estates of small value; as custodian trustee, or as an ordinary trustee; he may be appointed a judicial trustee, or administrator of a con-

roperty. The law of trusts generally is applicable to him. formation as to the machinery and procedure of the office e requirements necessary to obtain the services of the rustee are obtainable on application to the Public Trustee Kingsway, London.

and.—The history of the law differs considerably from that land, though perhaps the position of the Scottish trustee not very different from that of the trustee in England. The of Uses did not apply to Scotland, since neither that nor ilar legislation was necessary in a system in which law and were administered by the same tribunals. Trusts seem to xisted from time immemorial, and have been frequently ed by statute. The policy of the English Statute of Frauds doubt intentionally imitated in the Act 1696, c. 25, enact- t no action of declarator of trust should be sustained as to ed of trust made for thereafter, except upon a declaration x-bond of trust lawfully subscribed by the person alleged trustee and against whom or his heirs or assignees the tor should be intended, or unless the same were referred oath of the party *simpliciter*. The act does not apply to es, but only to those in which by the act of parties docu- of title are in the name of a trustee, but the beneficial in another. The person creating the trust is called the , a term unknown in England. On the other hand the term *que trust* is unknown in Scotland. The office of trustee is facie gratuitous, as in England, it being considered to fall the contract of mandate. Some of the main differences n English and Scottish law are these. There is no pre- on in Scotland of a resulting trust in favour of a pur- A trust which lapses by the failure of a beneficiary goes Crown as *ultimus heres*. The office of trustee is not a ffice, therefore there is no right of survivorship, and on th of a trustee the survivors are incompetent to act, unless in number be declared or presumed to be a *quorum*, or the e conferred on trustees and the accedors and survivors of Sometimes the concurrence of one trustee is rendered abso- necessary by his being named *sine qua non*. The Court of may appoint new trustees, but generally appoints a l factor. There has been a considerable amount of legisla- hiefly in the direction of extending the powers of trustees the court in trust matters. The powers of investment given tees are much the same as those allowed in England.

ted States.—It is generally true that the institutions of glish law were adopted bodily by the American colonists ecame part of their jurisprudence modified only in such as the exigencies of the new country demanded. That this ue of trusts is, however, somewhat remarkable in view of an hostility during the 18th and early 19th centuries to the n system of equity jurisprudence. Indeed, several colonies sed no chancery courts and not until the late 19th century ll equity powers been vested in State courts such as Massa- ts and Pennsylvania. Despite this, however, the trust as ped in England was well-known in America. Remedies were istered in the absence of equity powers by law courts h their own legal forms. The institution consequently fol- the English law in its major outlines and only the more ant differences need here be considered.

sive trusts, in which the trustee performs no active duties simply a receptacle of the legal title, have under various es ceased to exist for practical purposes, such a grant being d to vest the beneficiary with legal title. This result, reached American States through a judicial extension of the Statute of Uses or by local legislation, has in substance done away with all passive trusts except such resulting or constructive trusts as are created by operation of the law. Consequently for the effective creation of a trust it is necessary to impose affirmative duties of administration upon the trustee. Furthermore legislation in the several States similar to the provisions of the English Statute of Frauds requires trusts of real property to be in writing, though trusts of personal property unless created by will may be established by oral evidence.

Notable American legal doctrines concern the purposes for which trusts may be created. The spendthrift trust, a distinct American institution, seeks to secure the beneficiary against his own improvidence or incapacity by providing against alienation by anticipation of the trust income by the beneficiary either by his own voluntary act or *in invitum* by his creditors. The beneficiary cannot assign his right to receive future income nor can such income be subjected to the payment of his debts. In England such trusts have been held invalid on the ground that it is against public policy to permit the ownership of property without permitting its alienation nor burdening it with liability for its owner's debts. The majority of the American States have upheld the validity of such trusts, following the views enunciated by the Massachusetts court in *Broadway Nat. Bank* v. *Adams*, 133 Mass. 170 and the Supreme Court of the United States in *Nichols* v. *Eaton*, 91 U.S. 716. American legal doctrines surrounding the creation of charitable trusts have had a curious development. After intimating that their validity depended solely upon statute, the Supreme Court of the United States in the famous *Girard Will Case* (2 How. 127) concluded that the English Statute of Charitable Uses of 1601, 43 Eliz. c. 4, was but declaratory of the common law and that such trusts were valid in the absence of legislation. Several State courts had theretofore repudiated the Statute, and the early legislation of these States failed to recognize the existence of charitable trusts. The failure of the famous Tilden trust devising several millions for charitable purposes to the city of New York under a decision of the Court of Appeals of New York led in 1893 to legislation in that State and similarly situated States restoring the old English system of charitable trusts. Indeed, since then the American courts have generally been more liberal than the English courts in their interpretation of what uses may be regarded as charitable. The policy involved in the English mortmain statutes finds its counterpart in different types of American statutes. Some restrict the amount of property a charitable corporation may hold; others prohibit a testator from giving more than a certain portion of his fortune to charity; and still others invalidate all gifts to a charity made within a brief period before the death of the donor.

There are numerous distinctions between English and American law concerning the rights of the trustee, of which the more important may be noted. Unlike the English rule, the trustee even in the absence of a provision in the trust deed for remuneration, is entitled either by statute or under equity rules to a reasonable compensation for his services. Such remuneration is commonly calculated on a commission basis, and the trustee possesses a lien upon the trust property for his services. Two or more trustees are entitled to one commission only. Strict rules, however, prevent a trustee from deriving any personal benefit from his trusteeship by action antagonistic to the best interests of the beneficiary. The various States have many different rules governing the manner in which the trustee shall invest the trust property. The subject is largely controlled by legislation setting forth the specific types of securities which the trustee may purchase. Corporate bonds of approved railroads and public utility companies are generally considered legal investments and a few of the States permit investments in the common stock of reputable corporations. Though mortgages upon real property are permissible investments, real estate as such is commonly considered too speculative and too unconvertible for purchase by the trustee. Two different rules prevail in America concerning the distribution of income of trust estates as between life tenants and remaindermen. When such income is represented by dividends, the rule of some States requires the payment of cash dividends to the beneficiary, whereas

stock dividends are to be held as capital. Other States, however, regard the source of the dividend as the test, holding that all dividends whether in stock or cash accruing from profits earned subsequent to the creation of the trust are payable to the beneficiary.

Of interest also is the development in America of the institution of the trust as a means for aggregations of capital to carry on business. This development should be distinguished from the monopolistic illegal "trust." The legal trust contemplates contributions by a number of persons of capital to trustees who, under a declaration of trust executed to them, carry on the business for the benefit of such persons as are beneficiaries. Transferable certificates are issued to the contributors and income from the conduct of the trust is paid to them in the manner of dividends. Since the organization is simply an adaptation of the common law trust no legislative authorization is a condition precedent to the right to carry on business in this manner. The declaration of trust also provides that only the trust property and neither the trustees nor the shareholders are to be individually liable to creditors. The chief distinction between such an organization and a partnership is that the shareholders as beneficiaries cannot control the management of the business by the trustees, and if power to manage the business is vested in the shareholders or if they are permitted to appoint and remove trustees at will, the courts treat the organization as a partnership. Though this application of the trust is not unknown in England (see *Smith* v. *Anderson,* 15 Ch. D. 247), conditions peculiar to America have made for its extraordinary growth in the latter country. The device originated in Massachusetts, hence the term "Massachusetts trusts," due to the fact that the laws of that State did not allow corporations to deal in real estate. Experience refined the forms of organization to permit their application to other enterprises, but until late years the device was not generally employed in other States. But when legislation during the beginning of this century sought to impose onerous burdens upon the doing of business in the corporate form, especially upon corporations of other States, the trust device was generally resorted to in order to avoid these burdens. The business trust thus became a familiar type of organization. It was expressly recognized by legislation in Oklahoma in 1919, and since then by a few other States. Some State courts, however, have as yet failed to recognize the possibility of adapting the trust as a form of business organization.

Another adaptation of the trust for business purposes is the voting trust, a device whereby the stock of shareholders is deposited with a trustee for the purpose of controlling the policy of a corporation. The interests of the shareholders are commonly represented by transferable certificates. Though in some States such trusts cannot be employed to control certain types of business, their legality is recognized provided that all shareholders shall be permitted to avail themselves of the trust agreement and provided that its purpose is to benefit all shares alike.

TRUST COMPANY, is a financial institution organized to perform duties and functions for corporations and private individuals and to assume the general responsibilities imposed upon individuals and corporations under the law of trusts. While the principal business of these companies in their formative period early in the last century was the supervision of personal estates and the negotiation of insurance, the insurance function has disappeared, and the trust companies have become a major factor in commercial banking for both domestic and foreign business, in addition to being corporate fiduciaries. The broad financial powers that the trust companies enjoy have earned for them the name of department store banks, and their growth in the United States has been rapid since the opening of the 20th century.

As organized to-day, trust companies in the United States perform in many instances a complete commercial banking ser and many also maintain complete savings departments, but t trust functions are distinct from their general banking serv and cover two separate fields, namely, personal trusts and porate trusts.

Personal Trust Department.—In its personal trust dep ment, the trust company, either as executor or administrator, tles estates of individuals. As trustee, it manages property u the laws pertaining to trusts, distributing income and princ to beneficiaries designated in the wills or trust deeds under w it operates. A trust company may be designated as trustee e by the terms of a will, or by the terms of an agreement ent into during the life of an individual. The latter form of t is usually known as a living trust or a voluntary trust, and w made to cover policies of life insurance it is designated as a insurance trust. In its personal trust department, the trust pany also acts as a guardian of property for minors, and as mittee of property of incompetent persons.

The fundamental duty of a trust company is sound man ment of property placed under its care and application of come and distribution of principal in strict accordance with terms of the instrument under which it acts. An additional s ice to individuals which a trust company performs is caring securities in safekeeping or custody. Through this service, trust company attending to the collection of income and matu principal, the details of routine care and watching for cha in the status of holdings, such as redemptions, conversion p leges, etc.—the securities, however, are always under the co of the owner and may be withdrawn or added to.

Corporate Trust Department.—In its corporate trust dep ment, the trust company plays a vital part in the issuanc bonds, the registration and transfer of stocks, the handlin property under escrows, the exchange of securities under ca readjustments and changes, as fiscal agent for governments corporations, and in other capacities. It renders important s ice in corporate reorganizations, under bondholders' or st holders' protective agreements; consolidations, dissolutions reorganizations; voting trust agreements; creditors' agreeme receipt of subscriptions to securities offered in the form of ri and disbursements of liquidating dividends. As paying agent corporations it pays interest on bonds, also the principal of tured or called bonds; it also handles the disbursement of dends for corporations. The trust company also holds secur for corporations in safekeeping, affording the same service as to individuals described previously. An important feature trust company service, as it is organized by the larger trust panies, includes special service to municipal, county, State Government officials, as trustee and paying agent under b issues, registrar of bond issues, and in other fiduciary capac

Early History.—Early in the 19th century the first trust panies made their appearance in the United States and carrie a business of insurance and trusteeship for estates and individ As the corporate form of commercial organization became a d nating factor of American business toward the close of the tury, there were created many opportunities for the trust comp to enter new fields and to undertake duties hitherto unattemp Also, it was not until the latter half of the 19th century that large private capital aggregations had been amassed. The bination of this accumulation of large personal fortunes and increasing tendency toward the corporation type of busi organization provided the extensive field in which the trust panies were privileged to operate.

Since the Civil War, which caused the enactment of the tional Banking Act in 1863, there have existed side by side systems of banking in the United States, namely national State. The expansion of the trust company in the '80s and however, soon attracted considerable attention. It was not before the banking community of the country realized that new form of financial organization was destined to become on the important systems in the country's banking machinery.

Under the general trust company law of New York State acted in 1887, trust companies were empowered to accept

nd pay interest upon balances. This feature of trust com- ctivity was the root of the national bank-trust company ersy that subsequently developed. Shortly after 1900, r, trust companies began to maintain a cash reserve deposits. During 1903, the New York clearing house l a resolution in regard to the reserve requirements of mpanies. Starting at 5% of their deposits, it was later ed to 15%. Trust companies in New York city later with- om membership in the New York clearing house, but sub- legislation fixed the reserve against deposits at 15%, vas divided into three classifications, namely, 5% in cash, h approved banking institutions, and 5% in certain types ls, preferably government or municipal issues. With the ent of the Federal Reserve law, important changes were n the financial machinery of the country; seasonal and demands for funds in different parts of the country could ily be met. Under the Federal Reserve System, with the divided into 12 sections, the flow of credit from one sec- the other was greatly stimulated, and the primary cause ncial panics practically eliminated.

nt Expansion.—Since 1900 the history of the American mpany has been one of phenomenal expansion and develop- The report of the controller of the currency of the States for the fiscal year ended June 30, 1900, which sum- the condition of all reporting financial institutions in that , stated that 290 trust companies possessed a total capital ,930,840, while their deposits amounted to $1,028,232,400. the next 27 years, the number of companies reporting to ntroller of currency had increased to 2,731, and their te capital during this interval rose even more rapidly. The of the condition of these institutions on June 30, 1927, that total capital amounted to $1,161,305,900, and that s were $16,824,822,700. The developments in the trust y field during the last ten years are still further empha- y the fact that in 1917, 2,009 trust companies had total es less than half the amount possessed by the companies ence at the close of 1927. A growth of 127% in trust com- esources occurred in this period, in comparison with the e of only about 25% in the number in operation.

atistical review of trust company growth is presented in mpanying table:

Trust Companies in the United States

une 30	Number	Capital	Deposits

onal Distribution.—Although the development of trust ies in the eastern section of the country has been greater the central or western sections, this is almost en- due to the fact that the States bordering on or adja- the Atlantic ocean were the first to be settled, and he first in which wealth was created. With the expan- business and the increase in population in the central, and southern sections of the country, the introduction of st company idea has gone along at a rapid pace. With New s the present financial centre of the country, however, the aggregate in trust companies' resources is destined to be in ar this section. The inauguration of the Federal Reserve did not in any way reflect upon or change the method of upervision of financial institutions within the borders of tes, but rather co-ordinated all financial resources to meet unusual or excessive demands when and where needed.

A constantly growing realization of the superiority of the fiduciary service rendered by a corporate trustee over an individual, with its fixed responsibility, legal continuity and trained staff, is stimulating the growth of these institutions rapidly. Observing the growth of this form of banking service the national banks secured an amendment to the National Banking Act in 1918 by which they were permitted to perform fiduciary services and many of the larger national banks now maintain trust departments organized for such purposes. (F. H. Sr.)

TRUSTS. The term "trust" is a convenient though mostly inaccurate label popularly applied to any large business concern, or amalgamation or association of business concerns, which exercises some degree of monopolistic power over output and prices in the industry with which it is connected. The "trust," as it first appeared in America in the '80s, was a form of organization in which the shareholders of a number of enterprises agreed to assign the whole of their stock to a small board of trustees, receiving in exchange trust certificates representing the valuation of their properties. This particular way of bringing a number of rival businesses under one direction has no particular significance nowadays, and it is but by historical accident that it has given its name to something much wider than itself; but the term has become established, and when a British official committee was appointed in 1918 to enquire into all forms of trade organization and combination it was officially designated "The Committee on Trusts." The subject of this article, then, is not "trusts" in the derivational sense, but the whole movement of which the "trust" proper was and still is one example. That movement has two main aspects. It entails, in the first place, a change in the size of the business unit, a change from a multitude of small separately-controlled businesses to a few big businesses; and in the second place a change in the basic principle upon which industry is conducted, a change from competition as the ruling factor in the fixing of output and prices to deliberate control, fortified by monopoly, on the part of the manufacturing or commercial interests concerned.

From Competition to Combination.—The system under which goods are produced, distributed and bought is still commonly referred to as the "competitive system," but for the last half century and longer the economic order has been changing and the assumptions upon which it was formerly held that supplies, prices, profits and wages were best left to the free play of competition are becoming ever less valid. For an account of the competitive system and the nature of the change from competition to combination the reader should see the article COMPETITION IN INDUSTRY, where the virtues and triumphs of competition are extolled but it is shown that there comes a stage in industrial development at which the continuance of competition along the old lines is actually detrimental to industrial efficiency and obstructive to further progress, and that when that stage is reached, or when industrialists wake up to the fact that there is an easier way than competition to the ends they pursue, competition gives place to combination.

FORMS OF COMBINATION

(1) **Gentlemen's Agreements.**—Industrial combination in the dual sense of the replacement of many small firms by a few large firms and the substitution of concerted control for competition takes a wide variety of shapes. At its simplest and most elusive there is no outward sign of change but a few business rivals meet from time to time and reach an "understanding" in regard to prices, output, division of business, etc. In effect, the competitors agree not to compete: that is all. Nothing is put on paper; a gentleman's word is as good as his bond. Such understandings are fairly common among local coal dealers, carriers, shopkeepers etc., and are no less a figure in industrial diplomacy on the largest scale. The reader should see the article GENTLEMEN'S AGREEMENTS.

(2) **The Trade Association.**—A more advanced kind of combination is that in which a large proportion of the manufacturers or traders in a particular line of business form an association for

the purpose of regulating the trade. Here, as in the "Gentlemen's Agreement," is exemplified one only of the two aspects of combination: there is no change in the size of the business unit, but something has happened to the competitive principle by which the relations of the various firms are supposed to be governed. Associations for the regulation of trade are associations for the "rationalization" of competition. This can be effected in a variety of ways; by fixing uniform prices, by apportioning and controlling output, by supervising tenders, by dividing up the market. For an account of these bodies, which are to be found in almost every branch of industry in Great Britain and America and indeed in all industrial countries, the reader should see the article ASSOCIATIONS, INDUSTRIAL. The economic effects of the limitations of competition effected by these associations, and the social and political problems to which the possibilities of abuse of their powers give rise, will be discussed at greater length in the present article as part of the comprehensive phenomenon and problem of the "Trust" movement.

(3) **The Consolidation.**—The most concrete type of combination is the mammoth business of such size and power that it represents within itself the greater part, locally, nationally, or maybe internationally, of the particular line of business in which it is engaged and is able within limits to control the output of the industry and dictate the prices at which its particular type of goods shall be sold. In local trade its rudiments may be seen in the case of the cobbler or farrier who has "no opposition" and whose customers must pay his prices or incur the expense of going far afield for the satisfaction of their needs: but these do not make the modern problem; improving facilities of transport and the ease of establishing rival concerns provide sooner or later an effective remedy. The phenomenon and the problem are only formidable where the consolidation is on at least a national scale. In these cases it almost always occurs where two or more previously independent business concerns are permanently amalgamated into one large concern under more or less completely centralized direction and control. It may be a coalition of equals, or it may be the result of a powerful concern buying up one or more smaller rivals: it may have been engineered by outstanding personalities within the industry, or it may be the result of operations promoted by outside financiers: the previously independent businesses may continue to operate to all outward appearance as though they were still independent, or some of them may disappear as separate entities, their goodwill and business passing to more efficient establishments within the amalgamation. According to their origin, scope and manner of operation, distinguishing names have been given to these conglomerate bodies. The term "combine" is frequently used in Great Britain, generally to designate a merging of firms in the same line of business at the instance of some dominant concern or group among their number. The term "merger" is more usually used in the United States in much the same sense. The term *"Kartell"* is widely used to denote the specifically German type of joint selling organization. (*See* CARTEL.) Trust, as already mentioned, has particular application to the former American plan of assigning the stock of the associated enterprises to a body of trustees. There is no need for present purposes to examine more closely these differences in financial structure and control. The terminology is largely arbitrary, and the distinctions often without real significance. It is, however, useful to recognize another broad distinction in the composition and industrial range of the greater consolidations which cuts right across those mentioned above, that between the "vertical" and the "horizontal" type; for the relative beneficence and success of the one and the other is a matter of some moment. The "vertical" consolidation results from a merging of firms engaged in the production of a commodity at successive stages of manufacture; *e.g.*, coal and iron mining, pig iron, iron and steel and ships. The "horizontal" consolidation, on the other hand, results from the merging of firms engaged in the same line of business at the same stage of production, *e.g.*, the firms engaged in the bleaching and dyeing industry or those engaged in the manufacture of cement.

Multiple Directorships; Banking and Accountancy Control.—Among a miscellany of forms taken by the movem under discussion, other than those already named, three of greater import than might at first sight appear call for spec mention. The first of these is the increasing practice of person holding directorships in a number of ostensibly compet firms or in firms engaged in mutual trade. Cases of pers holding a dozen directorships are common; and it is on rec that as many as thirty-two directorships, including thirteen ch manships and three positions of managing director, in busine of the first order of magnitude concerned not only with ma facture but also with banking, shipping, railways and telegra have been simultaneously held by one person. The same p nomenon appears in more systematic guise where arrangem for the collaboration of erstwhile competing firms take the fo known as "interlocking directorates" in which an interchange shares is accompanied by arrangements whereby the directors one concern sit upon the board of another. Where these c ditions obtain it is evident that the idea of competition in its crude sense must be modified. The second is the control exerci over a large part of the industrial field by the great banks. I not suggested that the details of prices, output and marketing matters with which the banks concern themselves, but their fluence over the industrial and commercial policy of their cli is hardly in dispute, and that influence has its reflex upon policy of its clients towards each other. (*See* BANKING.) third is the increasing part played in the financial administra and structural reshaping of great industrial concerns by firms accountants who have come to combine with ordinary accounta work the functions of the financing house and the entrepren Throughout any survey of tangible consolidations and trade a ciations these less tangible influences must be kept in mind comprehensive idea of the extent of trade combination is to obtained.

National Characteristics.—The combination movement accommodated itself in each country to national conditions characteristics. In the United States the size of the natio market, the natural protection accorded to home manufactu by the distance of that market from European manufactu centres, and the singular uniformity in the goods required American consumers, were all favourable to centralized large-s production. The greater importance of rail transport costs a element in total selling costs and the highly monopolistic posi of the main railroads gave added cause for collaboration am manufacturers with a view to collective bargaining with the road interests. These circumstances, together with a national for power and masterdom, conduced when time was ripe rapid growth of great industrial consolidations. In the Un Kingdom great consolidations wielding monopolistic and polit power have not in general been so formidable as in America, have British associations of independent manufacturers develo so fully the range of activities displayed by such organization Germany. The movement toward industrial combination in United Kingdom has been relatively more cautious and spectacular than elsewhere. The reasons for this would ap to be partly the deep-rooted individualism of the British ma facturer and partly the greater difficulty of establishing mono listic consolidations in a country where many of the principal dustries are widely dispersed, where the raw materials of m of the great industries are drawn from world-wide sources where such shelter as monopoly might obtain from protec import duties has not been available. None the less, combina has replaced or minimized competition over a great part of industrial activity of the United Kingdom. In Germany the l concentration of the coal and iron industries, the moderate tective policy, the state-ownership of the Prussian railways, the inter-relations of industry with government, all contrib to the emergence of a special type of trade combination in form of a joint selling organization between independent conc in the same line of business empowered to fix and maintain pr and to allot the participation of each independent producer in aggregate output. For this German type of combination reader should see the article CARTEL.

ustrial Occurrence.—It would be difficult to lay down ule as to the industries which are most susceptible to com- on or have travelled farthest along that road; but a few alisations can be made. Industries engaged in supplying the for a standard unvarying product—*e.g.*, steel bars and rails, cotton, cement, salt, sugar, tobacco—invite combination than do industries engaged in miscellaneous and varying ction, such as general engineering and shipbuilding. Manu- ers requiring much capital for their establishment, or le of being carried on much more economically with ex- e plants are in general more easily collected into large gates by the instrumentality of high finance and are more against sporadic competition than are industries which e little capital. Local proximity has been a factor of some tance in certain cases as facilitating centralized control; but vements in transport and communication are minimizing actor. Patents have formed the bed-rock of combinations ne industries *e.g.*, electrical, chemical and shoe-machinery; ational monopoly has supported others. Manufacture in al lends itself to consolidation much more than agriculture; ombination plays an important part in the marketing of ltural products. For many years retail distribution lagged d manufacture as a subject for combination; but the last y years has seen an immense increase in the multiple shop ain store. Indeed, no array of purely economic factors will n why combination has developed much farther in some ries than in others; why, for example soap, cocoa and sew- otton should be represented in Great Britain by vast estab- ents; why shipbuilding and coal-mining should have stood ch aloof from the general tendency. The present industrial d of the movement would appear to have depended, as much anything else, on the chance emergence in certain industries, critical moment, of dominant personalities who have con- d great plans and carried them through. Where the right man the necessary powers has been lacking at the propitious nt combination has had to wait.

e growth and present existence of trusts in the United States een very largely conditioned by legislation. The passing of herman Act of 1890 necessitated the abandonment of the proper and led to the adoption of the method of complete gamation either by outright purchase or by the formation of ng companies. This process of consolidation has proceeded rapidly, with the result that a wide range of American indus- production has come to be under the dominion of giant con- exercising a large degree of monopoly power. Most promi- among these are the United States Steel Corporation, the national Harvester Company, the American Tobacco Com- the American Sugar Refining Company, the United States er Company and the Central Leather Company; but in the rical, Chemical, Cement, Oil Seed, Meat, Shoe Machinery, tructional, and Non-ferrous Metal industries, to name but a great consolidations play a dominant part. In the United dom consolidations of such a size as to be capable of exer- some degree of monopolistic power also exist in the main ches of manufacture. In the cotton branch of the textile in- y Messrs. J. & P. Coats and The Fine Cotton Spinners' and lers' Association are of long standing; and two great post- malgamations are The Amalgamated Cotton Mills Trust and es and Winkworths. In the woollen and worsted industries ination has taken the form rather of association than con- ation; but Woolcombers Ltd. is an amalgamation dating back years, while since the World War large amalgamations have formed in the worsted spinning and knitting wool spinning ons of the industry. Outstanding in the bleaching, dyeing, ing and finishing industries are the Bradford Dyers' Associa- the Bleachers' Association, the Calico Printers' Association, British Cotton and Wool Dyers' Association and the English et and Cord Dyers' Association. In the chemical industry ner Mond and Company, the United Alkali Company, Nobel stries and British Dyestuffs were amalgamated in 1926 into great undertaking; Lever Brothers, the Salt Union and Borax solidated, are each dominant in their respective branches of industry. In the coal industry amalgamation has not proceeded far, except in South Wales, where there are two large groups of anthracite collieries, merged under Amalgamated Anthracite Collieries Ltd. and United Anthracite Collieries Limited. In the iron and steel industry combination by terminable association has been accompanied by great concentrations of capital, such as Dorman Long and Co., Bolckow, Vaughan & Co., Baldwin's Ltd., The Ebbw Vale Co. and Guest, Keen and Nettlefolds. The engineering and shipbuilding industries, again, present a network of terminable associations studded by large consolidations. Foremost among these are Vickers Ltd., Armstrong Whitworth & Co., Cammell Laird & Co. and John Brown & Co., but a score more could be quoted within almost the same range of importance. In other industries examples of dominant consolidations may be found, notably in matches, glass, bottles, electric lamps, machinery and tobacco.

International Combinations.—From combines of national range and consolidations of national magnitude it is a natural step to agreements and amalgamations on the international scale. It has been estimated that there were in existence before the war 114 international associations, chiefly in the coal, ores, metal, transport, chemical, textile, pottery, paper and electrical industries. The object of the majority of these organizations was the regulation of competition, and especially the exclusion of foreign competition from the respective home markets of the participants and the division and demarcation of sales territories; but some of them regulated prices, credit terms and selling practices generally among their members and in a few cases there were arrangements for the exchange of patents or knowledge of technical processes. The outbreak of war in 1914 broke up most of these international groups, but since the war some have been re-formed and others are in process of formation or re-formation. Among these the International Rail Makers' Association is one of the earliest, having been first formed in 1884 by British, German and Belgian steel manufacturers for the purpose of dividing up export orders and securing the home market to the home manufacture. The association was re-constituted under the name European Railmakers' Association in 1926. The pool formed by the French, German, Belgian and Luxembourg steel makers in 1926 provides for the allocation of output quotas among its members with penalties for exceeding the quota and compensations for keeping below it. Associations existed before the war to regulate the international relations of manufacturers engaged in the production of galvanized steel, tubes, pipes, rods, wire nails and enamel ware, and many of these have been or are being re-formed. A copper syndicate comprising producers responsible, it is said, for some 90% of the world output and intended to control prices and reduce the number of middlemen was formed at the end of 1926. Potash, electric lamps, explosives, glass bottles and gas mantles are the subject of other agreements among the principal manufacturers in the various countries. In addition to these international associations, agreements, cartels or combines there were built up before the war a number of giant consolidations of world wide extension. In petroleum the world trade is largely dominated by two enormous groups, the Standard Oil Group and the Royal Dutch Shell Group. These in collaboration control something less than half the world's production but a far greater proportion of international trade. In tobacco the export trade of America and Great Britain is largely in the hands of the British-American Tobacco Company, and the match industry is largely dominated by a trust headed by the Swedish Match Company.

Relative Extent and Trend of Combination.—The degree to which combination has supplanted competition as the ruling factor of business operations must not be exaggerated. Even in the most powerfully organized industries competition plays its part with fitfully recurring intensity; while there are still industries (*e.g.*, coal, shipbuilding, textile, manufacturing, as well as a host of minor industries) in which the concerted control of output or prices or the concerted direction of industrial policy has made relatively little headway. But the steady trend is toward increased combination. Under the influence of war conditions not

only were numbers of listless associations galvanized into great activity and enterprise, but many new associations were formed. Also, one effect of the excess profits tax was to encourage the buying up of unprofitable businesses by prosperous concerns, for such purchases were in effect paid for by moneys which would otherwise have gone in excess profits duty to the revenue. For this and other reasons the war period was one of unusual increase in the number of amalgamations. Since the war the movement has shown no signs of slackening but the impetus has been towards amalgamation rather than association; indeed trade associations have been through a difficult time and several have dissolved. Despite the misfortunes that have come upon certain of the greater consolidations as the Nemesis of prosperity and inflation during the war and the post-armistice boom, the tendency is still toward large-scale amalgamation, and our economic and financial system appears to provide thus far no machinery whereby a great consolidation may dissolve into its constituent elements. It is an old American aphorism that "you cannot unscramble eggs."

The Advantages of Combination.—Great possibilities of industrial and commercial improvement lie beyond the confines of free competition, and are only to be realized by combination in one or other of its several forms; by informal consultation and co-operation, by formal association, or by actual amalgamation. Only from the latter proceeds in full measure the advantage that may follow from extending over a wide area the intelligence and control of technicians and administrators of outstanding ability such as only a large undertaking can afford to retain; and only the consolidation can order with plenary powers the policy of the industrial block over which it exercises authority and can acquire control of the sources of raw material and an influential interest in the means of transport; but associations as well as consolidations can effect many improvements and economies along the whole line of manufacture and sale. By the consolidation purchases of material and components can be made in gross instead of in detail, with the advantages of better selection, better terms and lower transport charges; middlemen can be side-stepped and, as already stated, the control over the sources of material can be acquired. The association is not entirely powerless in these matters, for it can assist members to better buying by collecting and distributing information on the point. As regards manufacture, it is possible under combination to arrange for a standardizing of parts and sizes throughout the industry, whereby production can be greatly cheapened and the parts of one maker made interchangeable with those of another. Again it is possible to arrange that instead of every firm trying to cover the whole ground, each shall devote itself to some particular section, and install specialized equipment for its own section and for that only, in which case wasteful duplication can be avoided and specialized skill developed; or, where other conditions prevail, it is possible to bring equipment and inside organization throughout the industry to a uniformly high level. Further, whereas under free competition the firms in one district may be working overtime while those in another district are on short time, it is possible with combination to maintain something like an equal distribution of work and to control orders so that the volume of work does not fluctuate so greatly from one period to another.

The economies in the matter of distribution to be achieved by associations and combines need little demonstration. Critics of the competitive system have often pointed out the wastefulness of the "five milkmen in one street." The economic waste of numbers of rival travellers, each seeking to frustrate the efforts of the rest, and of competitive advertisements which cancel each other out, has long been a subject of comment. But only by some form of understanding or concerted arrangement of monopoly can such wastes of competition be put an end to. Moreover, for a country carrying on a large export trade, representation in foreign markets is a matter of primary importance, and it has become increasingly apparent that independent manufacturers, if they combine for nothing else, must combine for the purpose of pushing their wares abroad if they wish to keep and extend their foreign connections.

With these advantages that combination alone holds out goes another—the freer exchange of knowledge. Under competiti every one of a host of small manufacturers works out his ov problems, evolves his own methods and processes, and "kee what he knows to himself." When a combine or a consolidation formed this secrecy is ended and anything worth imitating one branch is available for all the others. Associations do n always adopt the policy of "open doors" as between the membe but many of them go a long way in that direction, and the regul meetings conduce to a friendly atmosphere in which ideas a exchanged. The two essentials of the healthy rivalry which a vances, as distinct from the jealous competition which obstruc are a common basis of comparison and the pooling of da With combination it is possible to arrange for a uniform syste of costing throughout an industry and for the circulation cost-sheets showing what has been achieved by the most efficie firms. With such a sheet before him the less efficient memb can see precisely where his methods are faulty and can set work to improve them.

Possible Losses from Combination.—Against these possib gains on the score of productive and distributive efficiency mu be set some possible losses. Where an industrial unit gro beyond the compass of one man's personal detailed directio "system" must be introduced and system can degenerate in bureaucracy and red tape. What is gained in power and know edge at the centre may be lost in freedom and strength at the c cumference, and the over-grown unit is in constant danger becoming inefficient and reactionary. Again, under the shelter monopoly a comfortable somnolence may descend upon the gia concern, the fear of change is a well-known characteristic of lar administrations, and the large business unit may become stagna and even reactionary, especially if its control falls increasing into aged hands.

Rationalization.—Since the World War, a term not previous familiar has come into general use to signify the process of r ordering industry so as to achieve the advantages just mentione It is "the rationalization of industry." The implications of t term cannot, however, be properly understood except with refe ence to the indispensable condition of "rationalization"—ce tralized control wielded with monopolistic powers. Whatever in practice the net balance of the advantages and disadvantag set out above, whether they result in greater or in less producti efficiency, "rationalization" brings in its train the danger monopoly power being used to exact monopoly prices and con tions from the public. The problem for all industrial communiti is therefore one of how to leave business concerns free to achie the economies and other advantages of combination in so far they are consistent with the general interest, and at the same tir to provide means of curbing any tendency to use monopoly pow detrimentally to the public and of penalising those who do use it. (*See* RATIONALIZATION.)

Monopolistic Power.—Size is an important element in co bination, but mere bigness is not disconcerting so long as compe tion remains effective as a curb upon the operations of the ma moth organization. The problems with which industrial commu ties are faced arise when the proportion of an entire industry co ered by a great amalgamation is so large as to give it some degr of monopolistic power. It has sometimes been laid down as rough working rule that any consolidation or association whi covers 80% of the output of an industry can dictate the prices which the other 20% shall sell its competing products and so m be described as having an effective monopoly; but that formu cannot be applied indiscriminately, inasmuch as the limiting co ditions of control vary greatly from industry to industry and some industries very effective monopolies of merely local ran may exist. Confidence that the fear of competition can be reli upon to restrain tendencies to extortion on the part of even t most complete monopolies rests upon the belief that no associ tion, combine, or consolidation, even though it has a monopo can for long put up prices above what is fair and reasonable, b cause, if it does, it will only "invite competition": new people w come into the industry, competition will start afresh, and pric will fall. But a powerful monopolistic firm or group can make

nely difficult for any new entrant to get a footing. It can polize raw materials, put pressure on merchants and retailers, re investors by hints of an under-selling campaign. It can e distributing trade to it with deferred rebates and condi- commissions. It can make it so that no one will enter the gainst it except as a perilous speculation. It can in fact, if lined, build a stockade round its industrial territory. These e instruments and devices by which a monopoly which is not ete and which is always in peril of a recrudescence of com- n can maintain its dominance. For a fuller statement of the y, nature and significance of monopoly the reader should lt the article MONOPOLY. The practical outcome of the ples there expounded, as evinced in the case of the great lidations and powerful associations, are dealt with in this .

ects of Combinations: General.—It is in the nature of not possible to prove conclusively the effect of combination the well being and prosperity of an industry or upon the e of its output or the prices charged to customers. It is le to trace, in very many cases, the course of prices and s before and after the forming of a particular consolidation ociation, but from such surveys there is always lacking a edge of what prices and profits would have been had no nation been formed. Further, it does not follow that an in- d level of prices and profits, if proved, is of necessity an There have undoubtedly been, and will yet be, cases of indus- vorking for long periods at less than their proper remunera- and it may well be a gain, considered corporately, that an ry so placed should improve its position even at the expense rest. The idea that the state of an industry under competi- onditions is an ideal standard from which to measure depar- is not tenable.

ect upon Prices.—One of the most important trade associa- in Great Britain, the National Light Castings Association, ed in its original rules "The object the Association has in s that of raising and keeping up the price of the buyer. . . ." associations, however, would repudiate the suggestion that imed at raising prices; and would describe their policy as directed towards "preventing price-cutting," "securing fair easonable prices," "providing a fair return on capital and ," or, most probably, "stabilizing prices." This latter phrase he case for price-control at its strongest. Stabilization, regu- of output, continuity of returns is a desirable condition for dustry, a condition much preferable to one of violent alter- s of good times and bad; and steady prices are an impor- lement in steadiness of prosperity. Associations have done to prevent prices falling, at times of slack demand, to ruinous and there can be no doubt that during the war scarcity and ar boom periods the prices of goods controlled by associa- were not in general allowed to rise to the heights reached by not so controlled. This greater steadiness of prices has cer- dvantages for the consumer. Contractors and buyers of nanufactures and components find it satisfactory to be able end; in sending out estimates or in planning ahead their own pments, on a reasonable stability in the price they will have for their wares.

in, so far as the stabilization of prices is accompanied by the rdization by prices: *i.e.*, the charging of uniform prices or regulated in accordance with a known scale to all pur- s, there is some advantage in each contractor or retailer ng that his rival is buying on the same terms as himself. advantages, first to the industry itself and second to the facturers and traders who use its products are to be set off t the natural tendency of associations to steady prices in an d direction; and it must be kept in mind as at least a possi- that the proceeds of steadier prosperity will be devoted to vements so that in the long run the public may gain the ad- ge of cheaper goods.

e effect of actual amalgamations of business concerns upon ices at which their products are sold depends upon a multi- of factors—the circumstances of the businesses before the amation, the thoroughness with which the economies of combination are carried out, the extent of the monopoly power possessed by the amalgamation. There is, however, one factor which may and often does over-rule all these, that of capital inflation accompanying amalgamation. If the purchase price paid to the stock-holders of the several businesses is higher than the capital value of their earning capacities prior to amalgamation, or if the expenses of flotation and the rewards taken by promoters are considerable, the very increase in the capital on which dividends are payable may prevent any reduction in prices even though economies are effected in working costs; the increased capital may, indeed, be regarded as a future charge upon the industry arising from and equal to the economies the combination is expected to achieve.

Effect upon Output.—The output of an industry depends upon the demand for its products and that demand is largely conditioned by the price at which they are sold. In general, and with very many qualifications and exceptions, the effect of combination upon output is a reflex of its effect upon price. So much are price and output recognized as interdependent that trade associations have a choice of two ways of "stabilizing" the industry, one being the fixing of prices and the other the regulating of output. In the article ASSOCIATIONS, INDUSTRIAL, an account is given of the system under which certain associations regulate the output of the whole of their members by allotting to each a fixed percentage of the total production, whatever that total may be, with penalties for exceeding the quota and compensations for falling short of it. It is held by the promoters of such "pooling" associations that the effect of the system is not to diminish output. It is explained that under the system the total output is neither fixed nor even regulated: but is free to expand or contract in accordance with the total demand. It is difficult, however, to accept this view without some reservations. Since those who increase their output beyond the average are penalized, and those who fall below the average are rewarded, it would appear that the aggregate output must tend to be less than it would have been in the absence of any "pool." Yet such statements as "there has never been a time when we have failed to supply the utmost demand of the market" are doubtless made in good faith and have a certain truth. What happens is that under the influence of the penalties and rewards prices rise, and though the whole demand at the increased price may be met, it is a demand depressed to some extent by the greater costliness of the article. This appears in every way likely to be the immediate effect of the pool system; but against it may be set the consideration that in the long run the gains of steady and equalized production in the various works composing the industry and the greater efficiency due to the removal of obstacles to the interchange of knowledge may accrue to the public in the shape of lower prices, whereupon demand may recover and output increase.

Effect upon Quality.—It has been contended and with some truth, that the fixing of a uniform price at which all establishments in a given branch of industry shall sell their products does not mean an end of competition but rather a change-over from competition in price to competition in quality. Differences in price are more evident than differences in quality and are apt to affect the judgment more. The difference between £1 and 19/– in the price of an article is a plain matter of five per cent: the difference of five per cent in quality is less easily discernible. The immediate effect of the standard uniform price for various makes of the same article is undoubtedly to turn attention at once to differences other than price, and it may be accepted as usually the case that the establishment of uniform prices is followed by a tendency to improvement in designs and quality and hence in value.

Effect upon Evolution of Industry.—According to the competitive principle industrial evolution proceeds in part by the ill-endowed and ill-placed firm being "unable to compete" and after a struggle more or less prolonged going out of business. The ease and certainty with which this process of the "elimination of the unfit" accomplished itself in practice under the competitive system may easily be over-rated, but it certainly did occur. The risk of failure, of the total loss of all the capital sunk in the undertaking, was one of the accepted risks of industrial enterprise. Under combination other provisions are made for the flow of business from

the less efficient to the more efficient units. In the case of trade associations working a quota system the less efficient members of the group are the more ready to let their business go to the more efficient in that they receive, from the pool, monetary compensation. The least efficient may find it worth while to close down altogether and draw the compensation in perpetuity, and the firms best equipped for efficient production may find it well worth their while to do more than their quota and pay the penalty.

This transference of work from the less to the more efficient firms does in fact take place to a considerable extent, and it cannot be doubted that as a result production is carried on to greater advantage, but it is not so clear that much of the advantage accrues to the general public, since the greater part of the gains of increased efficiency go in the form of compensation to the less competent producers. Similarly with amalgamations. It may be essential to the attainment of an effective monopoly that all the firms in a line of industry, inefficient and unprofitable, shall be brought within the amalgamation. But the inefficient concern will not sell out at a knock-down price; the fact that its non-existence is needed by the amalgamation gives it a new value. Many a trust and combine, therefore, has had to acquire properties already overdue for dissolution and has had to choose whether to keep them in being or close them down. It will be observed that in both types of combination the cost of providing for the elimination of the units that have shown themselves least fit in the industrial struggle falls not upon the owners of the derelict business but upon the more efficient survivors. Questions as to what shall happen to the least profitable concerns in an industry whose capacity exceeds foreseeable demand are among the most difficult of all that confront attempts to "rationalize" such industries and were the main obstacle in 1927 and 1928 to rationalization in the coal and cotton industries of Great Britain.

Industrial States.—It must be accepted that the tendency is powerfully and probably irresistibly towards the formation of great consolidations representing whole branches of industry and that these consolidations have it in their power to effect great improvements in the lay-out and organization of the industry and to cut out much of the friction, waste and overlapping which is often due to competition.

It has at the same time to be borne in mind that as these consolidations come into being the old accepted basis and operating principle of industry undergoes a radical change, is completely revolutionized. The wheel comes once again full circle and industries are corporate bodies with monopolistic powers, in which a central intelligence directs policy and ordains what supplies and prices shall be. A consolidation representing the greater part of an industry, with command or influence over the sources of material and the channels of the distributing trade will be a close corporation from which would-be intruders can be excluded. The prospect opening out is thus one of a series of industrial monarchies or republics, enjoying an economic sovereignty within the political realm.

Limitations of Powers.—What are the limiting conditions within which these organizations can wield their monopoly powers. It will be evident that in the first place a combination representing an entire branch of industry and charged with the best present and future interests of that industry will not fix prices at a level which will cause the volume of trade to shrink, plant to be idle, and gross earnings to fall. How far it could go, if it cared to, in the direction of extorting monopoly prices depends on the elasticity of the demand for the goods it handles and in particular upon whether there is some other article, not very inferior, upon which the consumer can fall back in the event of prices being raised against him. In so far as its goods are sold to manufacturers in other industries the undue exercise of monopoly power is likely to produce a corresponding degree of combination among its customers, resulting in prices being a matter of negotiation, bargaining, and agreement between parties of the same order of strength. Where the combination is of no more than national range, foreign competition or the fear of such competition may act, in the absence of high import duties, as a check upon any tendency to abuse of monopoly power in some branches of manufacture, but the safeguard of foreign competition is apt to be rendered inoperative b international agreement or consolidation just when its influenc is making itself most felt.

LEGAL POSITION OF MONOPOLISTIC COMBINATIONS

Great Britain.—The position is set out in a report furnishe in 1927 by the Board of Trade to the League of Nations. In brie combination of manufacturers or traders is not governed by an special statute, but is subject to the common law doctrine tha restraints on trade are bad. Contracts or agreements in restrain of trade are in principle unenforceable, though they are not actu ally illegal unless they involve an illegal act. Nevertheless a co tract which is technically in restraint of trade has long been re garded by the courts as valid and enforceable when it involves particular restraint which is not larger than the protection of th party with whom the contract was made reasonably requires. Th doctrine of the unenforceability of contracts in constraint of trad is part of the larger legal doctrine of "public policy," which is in terpreted in economic matters as equivalent to freedom of trad or disapproval of measures in restraint of trade. In recent yea however, the courts have shown a perception of the fact that fre competition is not necessarily in the interests of the communit and that, on the contrary, competition may be accompanied or fo lowed by serious disadvantages. There has consequently been tendency for the law relating to combinations to be stated wit modifications. It may be noted also that in a number of cases th courts have upheld the legality of trade boycotts and other devic by which trade associations seek to strengthen their positio against outside competitors. Such devices are regarded as metho of competition and it is held that no action will lie in the absen of a specific illegal act. It remains true, however, that the inte pretation which the courts give to the common law doctrine rela ing to contracts in restraint of trade is a limiting factor upon th formation of powerful cartels, in that it is difficult for the latt to secure the enforcement of agreements as against disloyal or r calcitrant members. Under the Profiteering Act of 1919–21 inve tigations were made into the operations of trusts and combin in a number of industries and reports were published, but the ac lapsed in 1921 since when there has been no legal authority to r quire information to be furnished regarding the operations trusts or combinations.

Canada.—Section 408 of the Canadian Criminal Code dea with conspiracies in restraint of trade. The following are defin as offences under this section: to limit transportation facilitie to restrain commerce, to lessen manufacture, and to lessen comp tition. The Combines Investigation Act, 1910, was totally r pealed by Statute of 1919 and this latter measure was in tu repealed by the Statute of June 13, 1923. This Statute is entitle "An Act to provide for the Investigation of Combines, Monop lies, Trusts and Mergers." It is the only definite combines a existing in the British empire. It provides for the appointme of a registrar, whose duty it is, on receipt of a properly execute application, to cause an enquiry to be made into all matters co cerning the alleged combine. Upon the report of this preliminar enquiry the minister responsible for the administration of the a decides whether further enquiry is called for, in which case it undertaken with powers to require evidence on oath, and entr to all premises and documents. At the conclusion of every suc investigation a report must be presented in writing and with 15 days after its receipt by the minister it must be made publi unless for reasons of public interest. The law has thereupon t take such action as is necessary, and this may take the form reduction of import duties on foreign competing goods, revoc tion of patents, or prosecution in the courts on the charge of bei a party to or knowingly assisting in the formation or operatio of an illegal combine.

United States.—Under the common law of the United Stat as under English common law agreements in restraint of trade a not enforceable. In 1890 there was passed the Sherman Ant Trust Act which prohibited under severe penalties "every co tract, combination in the form of trust or otherwise, or co spiracy, in restraint of trade or commerce among the sever

or with foreign nations" and declares it to be an offence blish or attempt to establish a monopoly, or to combine pire . . . to establish a monopoly of commerce between eral States or in the foreign nations." Much difficulty er the interpretation of the act, in particular as to whether d to all contracts in restraint of trade or merely to those sonable restraint of trade. Successive Supreme Court de- made the position increasingly clear, but in general in ction of a more liberal interpretation of the statute. From decision in the case of the United States Steel Corpora- ppeared that the legality of a combination depended on portion of the industry it represented, and a 1911 decision ontracts not illegal unless in unreasonable restraint of As a result of these decisions it was felt that the Sherman ded strengthening and, on the other hand, it had become that some power of dispensation was required to modify ler effects of the act. Consequently, in 1914, two further re passed, the Clayton Act, and the Federal Trade Com- Act. The Clayton Act legalizes certain activities of trade ion which were declared illegal under the Sherman Act. s it illegal for a company to acquire shares in another y if this leads to "a real diminution of the competition companies" or "tends to establish a monopoly"; it pro- rice discrimination between different purchasers which lessening competition or creating monopoly; and the f discounts or rebates on condition that the buyer shall or deal in the goods of competitors; and it contains ns against the holding of posts simultaneously in different ies by directors and employees.

Federal Trade Commission Act established a commission members to be appointed by the president to which was two main tasks: to investigate and report upon the or- on and conduct of corporations alleged to be infringing -trust laws, and to prevent unfair competition. In pur- of the latter function the commission could, after oral issue an order requiring the cessation of any practice judged to be in contravention of the acts. If the order be carried out the commission might apply to the circuit r enforcement. With the exception of the 1918 Webb- ne Act, which permits associations for the purpose of trade which would be illegal in internal trade, the legal of trusts and associations remains as laid down in and 1914 Acts interpreted by successive Supreme Court s.

sh Attitude to Anti-Trust Laws.—As seen by British islation of the Sherman and Clayton kind is not easily ffective without the doing of more harm than good. The tee on Trusts, appointed in Feb. 1918, turned its attention o what might be called "policing" action than to repres- sought for ways in which combinations might be con- or supervised to safeguard the public interest from the monopoly power while being otherwise left free to achieve e economies and improvements which combination alone nish.

c ownership, public control, public competition, profit n and profit taxation were passed under review. In all ggested schemes three main difficulties were encountered utset; first, that of defining a monopolistic concern; sec- at of distinguishing rightful rewards of enterprise and y from the exactions of monopoly; and, third, that of ning the datum on which rate of profit can be calculated. uggestions were one by one rejected as limited in scope, of application, or hazardous in reaction, and the committee its attention in other directions. It was thought that if ublicity in regard to the conduct and earnings of business s generally, and of the working and effects of combina- particular, could be secured, the desired object would be measure achieved. It was also thought that some ma- should be provided whereby suspected or alleged abuses e penalised.

rdingly, the conclusion was reached that there should be ed a department of state charged with the duty of in- forming itself as to the nature, extent and development of combinations of all kinds in so far as they tend to the restraint of trade and the creation of monopolies, and of making preliminary inquiry into complaints made in regard to them, also that a tribunal should be set up to which the department could apply for powers to obtain particular information, and would refer for full investigation cases in which combinations appeared to act injuriously to the public interest. The requisite publicity would thereby be secured in two ways: the relevant facts as to offences proved before the tribunal would be made public, and the department would present annually to parliament a report upon the nature, extent and development of combinations. Publicity thus secured would not only be in itself a considerable safeguard against the abuse of monopolistic power, but it would serve to reveal actions and developments for which publicity alone was not a sufficient safeguard, and against which further action should be taken, whether in the form of nationalization, public competition or the control of prices and profits. These conclusions formed in substance the recommendations of the committee; but down to the end of 1928 they had not been made the subject of legislation.

Until the appointment of the Committee on Trusts no official investigation of the problem presented by the growth of combination in British industry generally had been made. The report of that committee, with its appendices, afforded for the first time to parliament and the public authoritative information as to the position. Subsequently committees appointed under the Profiteering Acts of 1919 and 1920 issued reports upon particular industries in which much detailed information was embodied. These reports constitute a mine of information for the student of industrial combination in the United Kingdom.

The standing of trusts and other combinations before the law, the government and public opinion of the United Kingdom presents curious anomalies. In July 1927 Justice Eve refused a petition to permit the twelve constituent members of the amalgamation "British Ropes, Ltd." to charge their assets, through the medium of a holding company, for the purpose of buying other businesses, and denounced the scheme as a most villainous and mischievous form of finance. He declared the combination to be inspired by gain only, its object being to reduce competition to its smallest possible limits and then to impose on the public a price in excess of what the public would be called upon to pay if competition had been left to find its own level. On appeal, the Master of the Rolls reversed the decision on the ground that there was reason as well as legal right, in the grouping of the companies concerned; and in this reversal Justice Lawrence concurred, but on the ground that the court was not concerned, under the Companies Acts, to see how the alteration would affect persons outside the company; the variety of these legal pronouncements reflects the indefiniteness of the bearing of the common law upon the modern monopolistic activities. The attitude of parliament as reflected in acts concerned in part with sectional questions of monopoly is perhaps most significant in its inconsistency. Amalgamations among the great banks have been prohibited; amalgamations among the railways have been enforced; and under the Mining Industry Act of 1926 compulsory powers can be given in certain cases to the promoters of colliery amalgamations for the bringing in of any recalcitrant undertaking whose adherence is essential to the success of the scheme; and in the case of rubber the state has participated in an international output-restriction scheme.

BIBLIOGRAPHY.—For the United Kingdom: *Report of the Committee on Trusts* (Cd. 9,236 of 1919), with *Memoranda* by J. Hilton, P. Ashley and J. Macdonnell. Reports of 57 committees appointed under the Profiteering Acts 1919 and 1920. A list of these reports, together with a survey of the work done by the committees, will be found in a report—*The Work of the Central Committee* (1921). Other official publications bearing closely on the subject are the *Report of the Royal Commission on Food Prices* (Cmd. 2,390, 1925); *Reports* of the Committee on Industry and Trade (1925 and 1926); various *Reports* by committees appointed under the Safeguarding of Industries Acts: *Reports* on the coal industry and coal prices by committees appointed by the Mines Department (1923 and 1924); the Linlithgow *Reports* on the distribution and prices of agricultural produce by committees appointed by the Minister of Agriculture (1923 and 1924); *Reports* on prices of building materials by Ministry of Health and

Board of Trade (1923 to 1925); *Report of the Royal Commission on the Coal Industry* (1926). The best account of industrial combination in the United Kingdom before the War is given in H. W. Macrosty, *The Trust Movement in British Industry* (1907), and the most recent objective account in P. Fitzgerald, *Industrial Combination in England*. For the United States: *Documents issued by the Federal Trade Commission, Washington D.C.; Public Regulation of Competitive Practices,* National Industrial Conference Board (1925); Thorp, *the Integration of Industrial Operation* (1924); Elliott Jones, *The Trust Problem in the United States* (1923). TRUTH. The concept of truth belongs to the fundamental philosophical problems—in fact, one may describe it as the central question of all theoretical philosophy. The first step in philosophic reflection consists in asking the question concerning the nature and criteria of truth. The world of being is no longer accepted as a simple datum, but a "reason" for it is required; a "principle" is sought which will enable human cognition to distinguish "genuine" being from "non-genuine" being, "reality" from "appearance," truth from error. The same change of attitude occurs also in regard to *values*. Here, too, cognition is not satisfied with the values accepted on the testimony of tradition, custom or authority, but inquires into the *meaning* of the difference between "good" and "evil," and seeks universally valid, "objective" norms to justify this distinction. In this two-fold significance, the problem of truth was first raised in Greek philosophy. From it evolved the various fields of philosophy within Greek thought. Logic as also ethics and physics have their common root in the problem of truth. For they are all founded on the presupposition that both the *immediate* view of reality, as presented to us in perception, and the immediate purposes pursued by instinctive impulse and desire, are not finally valid. This immediacy is transcended in the theoretical as well as in the practical sense: it is "questioned" and "called to account." This account implies that from now on, in the sphere of thinking, as in that of willing, individual contents are distinguished as having positive or negative value, the latter being rejected as "invalid," the former retained as "valid." This fundamental distinction forms the pervading theme of Greek philosophy.

The individual systems differ only in the means by which they try to solve it, by which they try to obtain a clear definition of the difference between "True" and "False."

In theoretical respects, the first step is made when the certainty of immediate sense perception is shaken and is opposed by another, "critical" authority. It is not the senses which decide about truth and falsehood, about being and non-being; the decision rests with reason, pure thought. The beginnings of this view can be traced to the older Ionian philosophy of nature, but it reached its proper development only in the classical systems of the great pre-Socratics. Parmenides and Heraclitus, Pythagoreanism and Atomism reject unanimously the view of the world as perceived through the senses and oppose to it another view which is based on thought—the power of the "Logos." According to Heraclitus, the senses alone are "bad witnesses": they can be used for a knowledge of reality only when they are judged by the soul as to their value and truth. The senses individualize and separate; as long as we follow them exclusively, each perceiving mind has its own world in which it remains enclosed. Thought, however, is "common to all": by means of it, alone, we reach a universally valid, "objective" view of the cosmos. "It is a duty to follow that which is common; but although the Logos is common to all, the majority live as though they had an insight of their own" (Heraclitus, *Fragment* 2 [Diels]; cf. *Fragments* 72, 89, 112–114). "Wisdom resides in One, in the recognition of the reason which pervades all and everything" (*fr.* 41). According to Parmenides, the road to truth consists in not allowing oneself to be misled by well-worn habit into trusting sense perc "no, by reason decide the controversial test, the ques Being and Non-Being" (Parmenides, *Fragment* 1, *cf.* 3 The true power of conviction (*πίστις ἀληθής*) does not r the senses but in pure thought: "for thinking and being same." Similarly, the Pythagoreans see the true *essence* o in number, because number is to them the principle of a "For nothing of delusion (*ψεῦδος*) does the nature of admit; but delusion occurs only in the realm of the unlimi unreasonable, and of that which is not determined by the (Philolaos, *Fragment* 11). Democritus distinguishes tw of cognition: the genuine and the spurious one. The spuri comprises sight, hearing, taste, smell and touch—in sh whole world of sense qualities, which exist only "accor custom";—the genuine one gives us an insight into the v the "true" reality, which belongs only to the atoms and space (Democritus, *Fragment* 11).

The completion of this trend of thought is reached i According to the platonic doctrine of ideas the sensibl as a world of becoming, can possess no veritable being c It is a world of mere "opinion" (*δόξα*), a world of "appe whereas truth and knowledge refer only to objects of pure which are not subject to change. This "rational" conce truth, however, was not without its countercurrents in Gr losophy. The *Sophists* deny the possibility of a univers valid for all thinking subjects. According to the pro of Protagoras that "man is the measure of all things," relative and subjective: "for each, his perception is tr Plato's *Theaetus*). Out of this opposition, there develops Greek philosophy the controversy between the "dogmatic" "sceptical" schools. For the former, there is a universal "criterion" of truth, which gives to certain concepts and p absolute certainty.

According to the *Stoics* this criterion consists in "c presentation" (*φαντασία καταληπτική*). It forms a spor achievement of thought, a type of assent (*συγκατάθεσις*) must be added to the sensible impression in order to *known.* A doubt with reference to the "cataleptic prese is not possible: we possess full evidence that the object duced in it as it is in itself. In opposition to this th Sceptics deny that there is any such criterion of "eviden supposed "truth" is mere probability. For the absolute the "things in themselves," are entirely unknown to us accessible to our judgment are merely the appearances o which, however, take entirely different shapes accordin differences of the perceiving subjects and the condition perception itself. The definiteness of reason, of the "L thus abandoned: concerning any subject there are innu assertions each of which may claim to be equally vali Herbertz, *Das Wahrheitsproblem in der griechischen Phi* 1913.)

Mediaeval scholasticism, in its definition of the concept refers throughout to Greek philosophy, especially to A According to it, truth consists essentially in the agree thinking and being, in the *adaequatio intellectus et rei* Aquinas, *De veritate* 1, 2). But this definition bears no content. For the problem of truth belongs no longer exclu the realm of logic, to the sphere of pure *cognition,* bu essentially to the question of *religious certainty.* The o between "sensibility" and "thought" is now replaced by t sition between "faith" and "knowledge." Religious faith s port in the intellect (*fides quarens intellectum*), although find in it a sufficient foundation but stands in need of superior source of certainty. Thus the problem arises a both principles of certainty, how "natural intellect" and tion" stand to one another. Scholasticism, at times, su relation of mere *subordination;* at times, it asserts a separation between them. In the later nominalism this separation is predominant. There arises the doctrine of truth," according to which a definite sentence may be t the standpoint of knowledge and false from the stanc faith. The problem of truth and of logical and religious

conceived most profoundly by Augustine. "Do not turn ; go back into yourself; in the inner life of man resides a." The inner life gives us, as a first indubitable starting e certainty of the thinking, feeling and willing subject: ainty of our own Being and Knowing and Willing. This cannot be attacked by doubt because doubt itself is an ought and must, therefore, presuppose the latter. "Who- ows himself as doubting, knows something true and is f that which he knows; he is thus certain of truth. There- ever doubts whether there is a truth, has thus in himself about which no doubt is possible. Therefore, he who t all, cannot doubt truth as such." (Augustinus, *De vera* , cap. 39.) However, this *immanent* truth as exhibited in cing consciousness, is not the only one, nor a sufficient one oundation of religious cognition. For the Being to which cognition refers, lies, as an *infinite* Being, beyond the human consciousness. For a knowledge of the Divine *io* must be "transcended" by another power of the mind. into the inner life of the subject and going beyond this e are thus the two phases which disclose the realm of truth ole. If there were only a truth of finite and contingent ve could stop with the finite, empirical consciousness as the f this truth. However, since there is a region of eternal *veritates aeternae*)—Augustine cites the truths of religion ure mathematics—there must be an infinite intellect which nem and in which they subsist. Human thought does not nese truths; it is only able to receive them in so far as it is ned by a higher power. In every cognition of a necessary rnal truth, our reason is only seemingly self-active and nous. In order to apprehend such a truth, it must be ned by the divine intellect. The divine Logos is the "hid- " which alone makes truth visible for us.

intimate connection of the problem of truth with the of God, which is characteristic of mediaeval epistemology, es for a long time also in *modern philosophy*. The after- of the Augustinian doctrine are obvious in Nicolaus Cu- nd Marsilius Ficinus. (*See* under FICINUS.) (*Cf.* Ernst , *Individuum und Kosmos in der Philosophie der Renais-* 927.) But also Descartes and Malebranche, Cudworth and bridge Platonists show clearly traces of this. On the other owever, there develops a more and more pronounced tend- emancipate the problem of truth from all entanglements eological questions and to give it logical independence. rationalism, as represented especially by Herbert of Cher- *De veritate* (1624), maintains the pure self-determination, onditioned autonomy of thought. Human reason decides g to its own, universally valid, innate principles about nd error. Its fundamental concepts and axioms are abso- inding. There can be no conflict between faith and knowl- cause any truth of faith needs the test of reason to attain be determined in its certainty. In Descartes, Spinoza and the clear and distinct cognition (*clara et distincta per-* is set forth as the criterion of truth. Those judgments ay claim universal assent which are founded on clear and ideas and which allow us to recognize the connection of eas with the same certainty that obtains in the propositions ematics. (*See* RATIONALISM.)

rdingly, the characteristic trait of truth, the *norma veri-* no longer placed in the agreement of a presentation or n in us with an external "transcendent" object, but in the ent with definite principles of reason itself. Every idea is rue which can be derived from them in a strictly deductive , by the method of purely logical or mathematical infer- When this proof has been given for a certain idea, there can oubt that the objective reality must conform with the idea; s agreement forms, itself, a necessary axiom of reason. Spinoza, for instance, expounds in his *Treatise on the im- ent of the understanding* that that which makes a thought thought, must lie entirely within it; that the real cause of s to be sought, therefore, not in an external object, but vely in the intellect itself. The mathematical idea of the for instance, is "true" even if there is no entity to be found in intuition and empirical perception which corresponds to the definition of the sphere in all respects and with perfect accuracy; and after this ideal conception of the sphere, we determine the reality of "nature" as it is grasped and "clearly and distinctly" recognized through geometry and mechanics. With particular clarity this conception of truth appears in Leibniz's *Meditationes de cognitione, veritate et ideis* (1684). Against the nominalistic view of Hobbes, that truth consists only in the correct connection of certain linguistic signs (*veritas non in re, sed in dicto consistit*), Leibniz emphasises that the correctness of the connection between the signs must be based on a relation between the ideas themselves. Truth, therefore, always depends on the relations which subsist between the pure ideas.

The process in which the assumption of one idea necessarily implies another, gives birth to the systematic coherence of knowledge—and this *nexus* according to the principle of sufficient reason makes up the fundamental character of all truth. Even the truth of phenomena consists only in the fact that they obey certain laws which correspond to the ideal truths of pure logic and pure mathematics. A different form is given to the problem of truth in the English philosophy of the 17th and 18th centuries. In Locke the "intuitive" truth of mathematical ideas is contrasted with the empirical certainty of the existence of things, which can never be inferred by pure logic, but rests on the testimony of sense perception. Empirical truth, in this sense, belongs only to the simple ideas which are given to us immediately through sensation or reflection. What we can predicate, on the other hand, about the connection of these simple ideas, about their coexistence, their regular recurrence, etc., has no truth in the strict sense of the word, no demonstrative certainty, but rests on mere probability. With Berkeley and Hume, this view is developed further and stated more radically with reference to the empirical knowledge of nature. The order of nature is not founded on principles which can be understood in themselves as necessary and unconditionally valid, but it represents a purely empirical regularity with which we become acquainted through *habit* and *custom;* the knowledge of this order can, therefore, never claim to be more than probable.

With Kant, the battle between the rationalistic and the empirical conceptions of truth is decided in such a way that the laws of pure understanding are recognized as necessary and universal, as valid *a priori,* but that, on the other hand, these laws themselves can retain their validity only within the bounds of experience. The traditional definition of truth—namely, that it is the "agreement of knowledge with its object"—involves, as Kant expounds in the *Critique of Pure Reason* (p. 82), a logical circle. For the problem of knowledge consists in determining just what the "relation of a presentation to its object" means, and how we can ascertain this relation. The concept of an "object of knowledge" is only the concept of a "Something in general=X," "because, apart from our knowledge, we have nothing which we could set over against it as corresponding to it." "It is clear, however, that because we have only to do with the manifold of our presentations and because that X which corresponds to them, in so far as it is to be something distinct from our presentations, is for us nothing, the unity made necessary by the object can be nothing other than the formal unity of consciousness in the synthesis of the manifold of presentations. Then we say: we know the object, when we have effected synthetical unity in the manifold of intuition." (*Kritik der reinen Vernunft,* 1st ed., p. 104 *seq.*) The "transcendental" truth, the truth of the object, rests thus on the "formal" truth; for only the forms of pure intuition and understanding make a connection of the phenomena possible; this connection, however, and nothing else, is meant when we attribute to a phenomenon objective significance, objective validity. However, since, on the other hand, the concepts of the synthesis *a priori,* although not originating in experience, all refer, nevertheless, to experience as the condition of its possibility, one may say that the possibility of experience is that which alone gives objective reality to all our cognitions. Cognition *a priori* has, therefore, *truth* (agreement with the object) only because it contains nothing further than what is necessary for the synthetic unity

of experience. (*Kritik der reinen Vernunft,* 2nd ed. p. 195 ff.) In this sense, Kant declares that with regard to theoretical cognition of nature, experience supplies the rule, and that it is the "source of truth" (*Krit. d. r. Vern.* p. 375); but in contradistinction to the empiricism of Locke and Hume, experience is here to be understood not as a "mere rhapsody of perceptions," but a synthetical unity according to laws. In this point, Kant sees the decisive contrast between his "formal" idealism and the speculative idealism represented, for instance, by Berkeley. "The thesis of all true idealists, from the Eleatic school down to Bishop Berkeley, is contained in this formula: 'All cognition through sense and experience is sheer illusion, and only in the ideas of pure understanding and reason is truth.' The principle which governs and determines my idealism throughout, is, on the contrary: 'All cognition of things merely out of pure understanding or pure reason, is sheer illusion, and only in experience is truth' " (*Prolegomena,* Appendix).

Also in the epistemology of the 19th and the beginning of the 20th century, the problem of truth is the central problem. It is especially the battle between pure "formalism" or "logicism" on the one hand, and "pragmatism" on the other, which gives to this epistemology its stamp. In the sense of "logicism," the concept of truth is determined especially by Bernhard Bolzano (1781–1848). Bolzano demands that the logical definition of truth must be set forth without any regard for the individual minds for whom the truth is valid, and without any intermingling of psychological determinations. Truth is entirely independent of the thought of an individual mind. This view is expressed in Bolzano's concept of a "truth in itself." "I understand by a truth in itself any proposition which predicates something as it is, whereby I leave undetermined whether this proposition has really been thought and expressed by anybody or not. Be it the one or the other, the proposition shall always receive from me the name of a truth in itself if only . . . the object with which it deals, really possesses what it attributes to it. Thus, the quantity of flowers, for instance, which a certain tree standing in a definite place had last spring, is an indicable number even if nobody knows it; a proposition, therefore, which indicates this number, has for me the name of an objective truth even if nobody is cognizant of it."

This formal determination of truth, which abstracts from any reference to actual thinking, is opposed by pragmatism (*q.v.*). For pragmatism, the concept of truth can be understood only if it is referred to the *activity* of thought, and if this activity is not considered merely in the abstract but is treated as a vital expression of a living individual. "True" is the term applied to those representations which hold good in the course of one's experience, *i.e.,* which prove practically useful. This "power to work" is the real characteristic and criterion of truth. It is, accordingly, not so much an abstract-logical, but rather a *biological* conception: the truth of a judgment is decided not by the agreement with a reality existing in itself, but by its practical efficiency. As a consequence, there results that *relativity* of truth which had already been urged by the Greek Sophists, especially by Protagoras. Truth is never absolute and universally valid: it is always true only for a definite biological species, inasmuch as the advantage of certain beliefs depends upon what is conducive to the species. (For a *criticism* of pragmatism, *see* CASSIRER: *Substance and Function.*) In an entirely different manner and with a different tendency Rickert tries to base the conception of truth not so much upon theoretical as upon "practical reason." According to Rickert's doctrine, we must start our quest for this concept not from the idea of what *is,* but from the idea of what *ought to be,* not from "ontology," but from the *theory of values.* The concept of reality finally presents itself as a concept of values; for we apply the name "real" to that which, in demanding recognition from every thinking mind, is valid as a *norm* for all thought. Only by regression to a superindividual command, to a "transcendent ought," can the meaning of truth be clarified and understood. All cognition, inasmuch as it proceeds by judgments, *i.e.,* by assent and dissent, implies an act of taking sides. Such an attitude, however, is possible only towards a value. Insight into this "primacy of the ought" is necessary for a satisfactory solution of the problem of truth. (Rickert, *Der Gegenstand der Erke* 1904.) In general, the treatment of the problem of truth epistemology of the 19th and 20th centuries, as compared that of the 18th century, shows a change in point of view opposition of "experience" and "thought," of "empiricism "rationalism," has been replaced by the opposition of the retical" and the "practical," "intellectualism" and "voluntа (E. But having been wo in an action with a privateer manned by his countrymen said that he declared he would never fight them again. H forth he commanded a succession of privateers sent out to against British trade. He had the reputation of being unif successful in all engagements with British vessels. Whe independence of the United States was recognized he return trade with a high reputation as a seaman. When the U.S. was reconstituted in 1798 he was one of the original corps captains. American commerce was then subject to much erable interference on the part of the French as well as British naval officers. It was against the first that Truxtu dered the services which have made him a prominent pers in the history of the U.S. navy. In Feb. 1799, he was capt the United States "Constellation" and on the 19th of month he captured the French "L'Insurgente." In the lowing year, and while still in command of the "Constella he fought the French "Vengeance," and drove her into Cu After 1802 he was not further employed by the navy depart He died at Philadelphia on May 5, 1822.

TRYON, DWIGHT WILLIAM (1849–1925), Am artist, was born at Hartford, Conn., Aug. 13, 1849. At th of 25 he left his position as a clerk in a Hartford publ house to devote himself entirely to art, and two years after went to Paris, where he became a pupil of the École des Arts, under J. de la Chevreuse, Charles Daubigny and A. met. He first exhibited at the Salon in 1881. In 1882– was director of the Hartford School of Art, and in 1886 b professor of art at Smith college. He became a National A mician (1891), and won numerous medals and prizes at impo exhibitions, among his pictures being "Daybreak," "Moon and "Early Spring, New England." He died at South Dartm Mass., July 1, 1925.

TRYON, SIR GEORGE (1832–1893), British admi younger son of Thomas Tryon, of Bulwick Park, Northam shire, was born on Jan. 4, 1832. He entered the navy in and served on various stations and in the Abyssinian expe of 1867. In 1889 Tryon was promoted vice-admiral; a August 1891 was appointed to command the Mediterranean which under him—following the example of his old chie Geoffrey Hornby—became an evolutionary and, in that sens perimental squadron. On June 22, 1893, the fleet being off T on the coast of Syria, in two columns, Tryon made the sig invert the course, the ships turning inwards in succession. fatal error, the psychological cause of which has never bee plained, he ignored the patent fact that the two columns w near each other that the manoeuvre, as ordered, must enta most serious risk, if not certainty, of collision. And, in fac two leading ships did come into collision, with the result tha "Victoria," Tryon's flagship, was cut open and sank in minutes. Tryon and 358 officers and men were drowned.

CHAIKOVSKY, NIKOLAI VASSILIEVICH (1850–
, Russian revolutionary and politician, born at Viatka,
d chemistry at the university of St. Petersburg under Men-
ev and Butlerov, and published in the *Bulletin of the Acad-
f Sciences,* an original work on chemistry. But pure science
ot satisfy the ardent youth, who strove for practical activity.
rt Spencer and Auguste Comte were Tschaikovsky's spiritual
. The 19 year old student became the soul of the "circle,"
soon took his name. "The circle of Tschaikovsky" laid
oundation of the Russian Narodniki (populist) movement
or many years directed its channels. Persecutions by the
rities changed the character of the movement; from purely
al it became political, and from the original circle it soon
created the revolutionary-terroristic "Narodovolzy."

Tschaikovsky fought desperately against the new tendencies, and after a strong moral crisis left Russia with a few followers for America, where he founded in the wild steppes of Kansas a colony of people "seeking God in themselves." He organised this commune of "Godmen" in the belief that only people enlightened from within could conquer social evils and form a perfect society. Nikolai Vassilievich remained true to this conviction and his Christian faith to the end of his days. The Kansas experiment did not succeed and after two years Tschaikovsky returned to Europe "to fight for his ideals among men."

He could not return to his country; long years of exile began. He worked in the "Red Cross of the Narodnaya Volia," in the "Fund of the Free Russian Press" and went to the United States to collect funds and to make propaganda for the Russian movement for freedom. In 1909 during a secret voyage to Russia he was arrested, but set free after trial. He devoted himself to the organisation of the co-operative movement in Russia. The war and revolution found the "first Russian Narodnik" at work in relieving the sufferings of the Russian people: he helped with the food supply of the Northern front, and fed the populations of Lettonia, Poland and Latvia ruined by the war. In the revolution of 1917 he fought to the last the Bolshevist currents in the councils of workers and soldiers deputies, finally resigned and gave himself entirely to the White fight against the Bolshevist government. He was elected a member of an All-Russian directory in Ufa, and later became president of the Northern Government on the Archangel front. Afterwards he was a member of the "political consultation" in Paris, and of the South-Russia government in Ekaterinodar and the Crimea. Exile again; once more emigration. The White front was broken, the White fight lost. After the fall of the Crimean front Tschaikovsky organised in Paris a secret "centre of action," for a fight against the Bolsheviks inside Russia. Until 1923 efforts were made to organise in Russia "a new revolution" but for lack of funds the "centre of action" ceased its existence.

TSCHAIKOVSKY, PETER ILICH (1840–1893), Russian composer, born at Votkinsk, in the province of Viatka, on May 7, 1840, was the son of a mining engineer, who shortly after the boy's birth removed to St. Petersburg (Leningrad) to become director of the Technological institute there. While studying in the school of jurisprudence, and later, while holding office in the ministry of justice, Tschaikovsky picked up a smattering of musical knowledge, but he was never suspected at first of possessing any special musical talent, of which there had been no previous traces in his family. Nevertheless, the seriousness of his musical aspirations revealed itself in due course and led him to enter the newly founded Conservatorium of St. Petersburg under Zaremba, where he was induced by Anton Rubinstein, its principal, to take up music as a profession.

With the former he fared better than the latter who, though worshipped by Tschaikovsky, seems never to have appreciated the gifts and promise of his young pupil who was destined none the less completely to eclipse his own fame. Very different was the attitude of Nicholas Rubinstein (Anton's brother) who showed his belief in the young musician in the most practical manner by inviting him to become, in 1866, practically the first chief of the recently founded Moscow Conservatorium, since Serov, whom he succeeded, never took up his appointment.

In Moscow, while engaged at the Conservatorium, Tschaikovsky wrote among other things his first opera *The Vojevode,* which was, however, a failure when produced in 1869. In the meantime he had met in St. Petersburg Balakirev, Stassov, Rimsky-Korsakov and other representatives of the then "advanced" school in Russian music, who exercised a stimulating influence on him, although neither then nor later was he ever wholly in sympathy with their ideals.

Also at this period he fell desperately in love for a time with the opera singer Désirée Artôt who, however, shattered his hopes by marrying someone else. He found consolation in his art, and his third opera *The Oprischnik,* was one of many works composed at this time, others including the pianoforte concerto in B flat

minor, the third symphony and another opera *Vakoula the Smith.* The *Oprischnik* was produced at St. Petersburg in 1874 and *Vakoula the Smith* in 1876, but neither had any success.

A happier fate attended the B flat minor piano concerto, which though severely condemned in the first instance by Nicholas Rubinstein (to whom it was originally dedicated) as clumsy and unplayable, as a mere duel between the piano and orchestra, and so on, was afterwards taken up with enthusiasm by Hans von Bülow (to whom the composer transferred the dedication) and performed by him everywhere with the greatest success. At the same time it is only fair to add that Tschaikovsky, though much hurt by Nicholas Rubinstein's strictures, considerably modified the work on the strength of his criticisms and that Rubinstein in turn ultimately recognized the merits of the concerto and played it constantly. To the period of the late '70s belong the E flat quartet, the ballet *The Swan Lake,* and the "Francesca da Rimini" fantasia among other compositions, while during this period also, namely in 1877, Tschaikovsky first began to work on the opera of *Eugen Onegin,* destined to become the most popular of all his stage works and first heard at the Moscow Conservatorium in March 1879.

Meanwhile the more personal side of the composer's career had been given a romantic touch by his acquaintance with his lifelong benefactress Nadezhda Filaretovna von Meck (1831–1894) and his deplorable fiasco of a marriage. In 1876 he had aroused the interest of Mme. von Meck, the widow of a wealthy railway engineer and contractor. She had a large fortune and she began by helping the composer financially in the shape of commissions for work, but in 1877 this took the more substantial shape of an annual allowance of £600. The strangest feature of their association consisted in the fact that, by agreement, they never met, though they corresponded with one another continually. In 1890 Mme. von Meck, imagining herself—apparently a pure delusion—to be ruined, discontinued the allowance; and though Tschaikovsky was then no longer really in need of it, he was deeply wounded by the manner in which she had made the announcement, and to the end of his days never entirely recovered from the shock which his abnormally sensitive nature had received from the termination of their relations.

Not less distressing was the episode of his marriage. Tschaikovsky married Antonina Ivanovna Milyukova on July 6, 1877, but the union proved an impossible one through no fault of hers but simply through his own abnormality of temperament; and it resulted in separation in October.

Tschaikovsky, who was deeply affected, went abroad with his brother to recover and was restored in due course to a more satisfactory state, but such happiness as he was to enjoy throughout the remainder of his career was qualified in an ever increasing degree by the tendency to melancholy and morbid introspection which, from the first, had been a conspicuous characteristic of his disposition.

Nor can it be said that he did not have many causes for discomfort and disillusionment in the ill luck and indifferent appreciation which attended in so many instances the performances of his works. But he continued to produce none the less with unchecked ardour and the fourth symphony may be named among the other works which he composed during his period of recuperation abroad.

Later, after his return to Russia, came the Italian Capriccio and the "1812" overture among other things. In 1879 he wrote his *Maid of Orleans* (produced in 1880) and his first suite for orchestra. In 1881 died Nicholas Rubinstein, to whose memory he dedicated the pianoforte trio in A minor. To the next five years belong the *Manfred* symphonic poem and the *Hamlet* overture fantasia, the operas *Mazeppa* and *Charodaïka,* the "Mozartiana" suite and the big fifth symphony, of which even the last-named, though reckoned nowadays among his finest achievements, failed to elicit any great enthusiasm at first. Nor were the opera *The Queen of Spades* (which later vied with *Eugen Onegin* in popularity) or the delightful ballet *The Lake of Swans, The Sleeping Beauty* and *Casse-noisette* any more favourably received when first produced, so far at least as the critics were concerned. B ter fortune, however, attended the *Casse-noisette* music in st form which soon found unlimited favour and quickly establish itself as one of the most popular pieces of its class ever writt (Incidentally, it may be noted that Tschaikovsky himself had poorest opinion of this music when he was actually writing

But though, after the time honoured experience of gen Tschaikovsky gained full appreciation so tardily in his own co try, in foreign countries his claims were much more readily rec nized. In 1887 the first of several concert tours took him Leipzig, Berlin, Prague, Hamburg, Paris and London, and v many warm friends for his music in every instance, not least in London where he conducted the Serenade for strings and Variations from the third suite at a Philharmonic concert.

Later, in 1891, he paid a visit to America, where he conduc six concerts—four in New York, one in Baltimore and one Philadelphia—and again he was everywhere received with bounded enthusiasm, the works performed being the Corona March, the third suite, two sacred choruses, the B flat mi piano concerto and the Serenade for strings.

In 1893 Tschaikovsky sketched his sixth symphony, becom more and more absorbed in his task as the work proceeded more and more firmly convinced that it was the greatest th he had ever done, a judgment subsequently confirmed in measure by the world at large; for this was the symphony af wards known as the "Pathetic," and under that title destined enjoy such world-wide fame and popularity as perhaps no sim work had ever known before. Yet even this symphony had a c and indifferent reception on the occasion of its actual first p formance (on Oct. 28, 1893) at St. Petersburg, though in instance the verdict was speedily reversed, both in Russia elsewhere.

But the composer was not fated to witness and enjoy triumphs. For within ten days of its production the world shocked by the news of his wholly unexpected death—from attack of cholera, caused by the drinking of unfiltered wate on Nov. 6, 1893.

As to the precise value of Tschaikovsky's music and the pl which it is likely ultimately to take critical opinion has b sharply divided, but with a prevailing tendency to accord far importance to his work than some consider its due. Almost evitably the enormous popularity enjoyed by so many of works at the hands of the general public has strengthened tendency and the impartial student may well wonder if, even w the worst has been allowed, the process of critical belittlem which has been witnessed during recent years in the case Tschaikovsky, has not gone far beyond the requirements of case.

While his work as a whole may be unequal, there is in the fi of his orchestral compositions, which represent him at his bes breadth and scope, a wealth of inspiration and imagination, an command of his materials which may well secure for ther far greater measure of favour at the hands of posterity tha anticipated by some of his critics. How, indeed, the title c great master can be denied to the composer of such things as fifth and sixth symphonies, the "Francesca da Rimini" fanta the B flat minor piano concerto, and the pianoforte trio, i indeed hard to understand. Tschaikovsky's operas are admitt on a lower plane than the best of his orchestral writing, tho containing many delightful pages, and much the same applie the songs, albeit these also include many examples—he wrote 100 in all—of rare beauty and charm.

TSCHAKSTE, JAN (1859–1927), first president of republic of Latvia, was born in Courland, Sept. 14, 1859. He educated at the Mitau gymnasium, studied law at the Universit Moscow, and was for some years in the public prosecutor's dep

f the Courland Government. Leaving the public service in e started practice as a barrister in Mitau and began to e paper *Tēvija* (Fatherland). In 1902 he served on a com- appointed by the local administration to enquire into ural conditions in Courland, and from time to time was ed on various Imperial Government committees. In 1906 elected a member of the first Russian Duma. The German n of Courland, July 1915, obliged him to leave Mitau. He Petrograd (Leningrad) where he founded a central relief tee for war refugees. In 1916 he went to Stockholm to e the cause of Lettish independence and published there nan his book, *Die Letten und ihre Latvija.*

18 Tschakste was elected chairman of the People's Council s later head of the delegation sent to Paris and London to the recognition of the republic of Latvia. He was presi- the Latvian National Council and in 1920 he was presi- the Latvian Constituent Assembly, and also became pro- f international law at the University of Riga. On Nov. 2, he was unanimously elected president of Latvia by the tvian Saemia (parliament), and on Nov. 6, 1925, was re- for a further period of three years, but he died on March 7, before the completion of his term of office, after a d painful illness. His activities as a statesman have been ith in special publications and, since his death, a memorial s been started.

HUDI, GILES or **AEGIDIUS** (1505–1572), Swiss n, a zealous Catholic, who became the chief magistrate *ammann* of Glarus in 1558, and in 1559 was ennobled by peror Ferdinand, to whom he had been sent as ambassador. however, best known as the historian of the Swiss Con- on. His great work is the *Chronicon helveticum,* or *issche Kronik,* dealing with the period from 1000 to 1470. e of its many inaccuracies, falsifications and acceptance less legends (comp., *e.g.,* the article, TELL) this work is great interest and merit, and was long considered the authority on its subject. It enshrines the text of many documents that would otherwise have been lost.

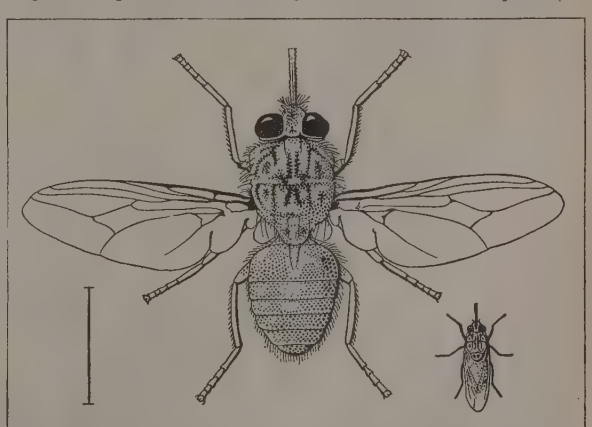
udi's chief works were not published until long after his The *Beschreibung Galliae Comatae* appeared under Gal- itorship in 1758, and is mainly devoted to a topographical, al and antiquarian description of ancient Helvetia and , the latter part being an early work on Rhaetia revised atly enlarged. This book was designed practically as an ction to his magnum opus, the *Chronicon helveticum* mentioned, which was published by J. R. Iselin in two folios (1734–1736). *See* Lives by I. Fuchs (1805) and C. 1856).

NG KUO-FAN (1811–1872), Chinese statesman and , was born in 1811 in the province of Hunan, where he succession the three degrees of Chinese scholarship. In e was appointed chief literary examiner in the province of en, and six years later was made junior vice-president of rd of rites. The Taiping rebels were overrunning Hunan, ēng was ordered to assist the governor of the province in a volunteer force, and on his own initiative he built a war junks, with which he attacked the rebels. His lieu- recovered the capital, Chang-sha, and destroyed the eet. Following up these victories of his subordinates, recaptured Wuchang and Hanyang, near Hankow, and was ed for his success by being appointed vice-president of f war. The rebels retook Wuchang and burnt the protect- t. Tsēng, however, succeeded in clearing the country he Poyang lake, and subsequently in ridding the province gsu of the enemy. In 1857 he took supreme command in iang. Subsequently the rebels were driven westwards and then cleared the province of Ngan-hui of rebel bands. 60 he was appointed viceroy of the two Kiang provinces perial war commissioner. At this time, and for some time sly, he had been fortunate in having the active support of ung-t'ang, who at a later period recovered Kashgar for peror, and of Li Hung-Chang. In 1862 he became t grand secretary of State. At this time the Imperial forces, assisted by the "Ever-victorious Army," had checked the progress of the rebellion, and Tsēng was able to carry out a scheme which he had long formulated of besieging Nanking, the rebel headquarters. While Gordon, with the help of Li Hung-Chang, was clearing the cities on the lower waters of the Yangtse-kiang, Tsēng drew closer his besieging lines around the doomed city. In July 1864 the city fell into his hands, and he was rewarded with the rank and title of marquis.

After the suppression of the Taipings the Nienfei rebellion, closely related to the former movement, broke out in Shantung, and Tsēng was sent to quell it. He failed, and was relieved of his command by Li Hung-Chang, who succeeded him in the vice-royalty of Chihli. Tsēng died in 1872.

Tsēng was a voluminous writer. His papers addressed to the throne and his literary disquisitions are held in high esteem by the scholars of China, who treasure as a memorial of a great and uncorrupt states-man the edition of his collected works in 156 books, which was edited by Li Hung-Chang in 1876. (R. K. D.)

TSETSE-FLY, the name given to any one of the twenty species of *Glossina,* a genus of African blood-sucking flies of the family Muscidae, order Diptera (*q.v.*). In appearance they are brownish insects banded or mottled with darker markings: they are somewhat larger than the house-fly and have a prominent proboscis projecting horizontally in front of the head. Their habit of resting with the wings closed flat, one over the other, on the back enables them to be distinguished from other blood-sucking flies. The female insect does not lay eggs but brings forth at intervals a single fully-grown larva which is deposited on the ground, where it speedily conceals itself in some shady place and turns to a pupa. The flies abound where there is bush or forest, often frequenting the margins of rivers, lakes and islands; they are not found continuously but are restricted to areas known as fly belts. Both sexes are active blood suckers and are most troublesome during the hotter parts of the day, attacking both man and domestic animals. They are of great economic significance because they act as carriers of the pathogenic organisms (trypanosomes) which are responsible for fatal diseases in man and animals. When a tsetse-fly alights on an infected subject and sucks its blood, numbers of the trypanosomes may be taken in at the same time. These tiny organisms require to undergo a developmental phase within the fly and when it is completed, are



TSETSE-FLY (GLOSSINA PALPALIS), FOUND IN WEST AND CENTRAL AFRICA. THE SMALLER FIGURE SHOWS THE INSECT WITH ITS WINGS CLOSED FLAT IN A RESTING POSITION, AND THE LINE ON THE LEFT INDICATES THE NATURAL SIZE

ready to pass into the blood of any man or animal upon which the fly happens to feed. In this manner the tsetse-fly *Glossina palpalis* transmits *Trypanosoma gambiense,* the causal agent of sleeping sickness from man to man by means of its piercing mouth-parts, and in a similar fashion *Glossina morsitans* transmits *Trypanosoma rhodesiense,* which is responsible for the more local or Rhodesian form of that disease. This same species of tsetse-fly is also the principal carrier of *Trypanosoma brucei,* which causes nagana disease among domestic animals. Five other

kinds of tsetse-fly have been proved experimentally to be capable of transmitting trypanosomes, and it is probable that a number of species are natural carriers of the diseases mentioned.

The development of communications has probably been responsible for the spread of sleeping sickness from West Africa to eastern Central Africa where the population had acquired no immunity. In the five years 1901–06 it is stated that over 200,000 natives died of the complaint in Uganda, where it was previously unknown, and the local tsetse-flies up till then were believed to have been uninfected with the trypanosome. The island population of Lake Victoria Nyanza suffered most seriously from this outbreak. Among the various methods which have been tried to control the fly, the clearing of vegetation around villages, so as to make such localities unsuitable for the insect, is now receiving attention. No feasible methods of luring or poisoning the insect are known, while the destruction of the concealed pupae presents great difficulties if carried out on a sufficiently extensive scale. The utilization of natural parasites has received some attention but at present offers little prospects of success. It has been proved experimentally that monkeys can be infected with the sleeping sickness trypanosome, and certain wild game, including antelopes, are regarded as functioning as "natural reservoirs" for trypanosomes although they themselves apparently suffer little ill effects.

For a discussion of this subject and all matters connected with the tsetse, *see* E. E. Austen and E. Hegh, *Tsetse Flies* (1922); also R. Newstead, *Guide to the Study of the Tsetse Flies* (1924). An account of the ravages of sleeping sickness is given by G. D. H. Carpenter in *A Naturalist on Lake Victoria* (1920). (A. D. I.)

TSHI, a group of Negro peoples of the Gold Coast (*q.v.*). The chief of these are the Ashanti and Fanti.

TSIMSHIAN, an American Indian linguistic stock on Nass and Skeena rivers and Milbank sound, British Columbia. They are typical North Pacific Coast tribes, forming, with the Tlingit, the Haida and certain Athabascans of the adjacent interior, a matrilineal sub-culture group. The four Tsimshian phratries, Raven, Wolf, Eagle and Grizzly Bear, are distributed through the three tribes composing the stock, namely Tsimshian proper, Niska and Gitksan. Population, originally estimated, 7,000; 1906, 3,700.

TSINAN, TSI-NAN-FU: *see* CHINAN.

TSINGTAO, a port on a large inlet named Kiaochow bay, on the south side of the base of the Shantung peninsula, China. The bay was occupied by Germany after the murder of two missionaries in Shantung in 1897, and negotiations followed, resulting in a lease of land to Germany for 99 years. The area leased was about 117 sq.m., and all points within 32 m. of any point on the bay were held not to be affected by Chinese ordinances without German consent. A free port was created in 1899, and a branch of the Imperial Maritime Customs was established there for collection of duties on shipments to and from the interior, in accordance with the general tariff. Tsingtao, on the bay, became the port and chief centre, and the German Government created educational and agricultural institutions in the leased territory, and fortified the port. Japanese forces took the place in 1914, and held it till 1922, when it was returned to China under the Washington Agreement. The port is connected with Chinan, the capital of the province of Shantung, by rail, and here the railway joins that from Peking and Tientsin to Pukow on the Lower Yangtze.

The Siege of Tsingtao.—The first part which Japan took upon herself to play in the World War was the reduction of the German stronghold of Tsingtao, on the bay of Kiachow. This fortress served at the outset of the war as the only base of operations in Eastern Asia for the German marauders menacing the Allied trade routes. It was imperative to make von Spee's raiders homeless, and the military and naval operations against the redoubtable base, which was under the command of Capt. Meyer-Waldeck and garrisoned by some 13,000 men, of whom 5,599 were German regulars, were started with the utmost despatch. On Aug. 27, 1914, the blockade of Kiachow bay was declared by the Japanese navy, and Lungkow, 150m. N. of Tsingtao, was chosen as the point for landing troops.

On Sept. 2, 1914, the Japanese division, under the orders of Lieut.-Gen. Kamio, commenced landing at Lungkow. Despite the terrible weather conditions, the vanguards arrived on the 12th at the small town of Tsimo, where they encountered the enemy the first time. The second Japanese contingent began to lan Laoshan bay, within the leased zone, on Sept. 18 and soon es lished touch with the first army. The Japanese forces under Kamio thus amounted to about 22,980 officers and men, and succeeded in some 10 days in wresting from the Germans sev of their advanced positions. On Sept. 24 there arrived at arena of campaign the British force, commanded by Gen. nardiston, consisting of 910 officers and men of the 2nd S Wales Borderers and 450 of the 36th Sikhs. After the non-c batants had been permitted to leave the fortress, the genera tack of the position was commenced on Oct. 31, the Japa blockading fleet off the harbour assisting by a continuous b bardment. On the morning of Nov. 7 white flags were desc on the forts of Moltke, Bismarck and Iltis, to the pleasant prise of the attacking army, which had expected a protra siege. After the fall of the stronghold it was ascertained tha enemy ships, including the Austrian cruiser "Kaiserin Elisab had been sunk in the port of Tsingtao. The Japanese army during the campaign 1,968 killed or wounded, and the Japa navy, a cruiser, a destroyer and a torpedo boat. The por Kiaochow was reopened for trade by the Japanese on Dec. 1914. (*See* WORLD WAR: *Bibliography.*)

TSINLINGSHAN, a range of mountains which forms southern wall of the Wei-ho valley and extends eastwards int plain of north China (Honan). It forms a boundary in geol climate and human relations between the region of loess in north and the basin of the Yangtze to the south. The Tapalin Tapashan is a range diverging from it south-eastwards, with valley of the Han between them. These mountains are often to be structurally a continuation of the Kuenlun system and, the Kuenlun, show folding of rocks up to the Upper Carbonife age, with granites and gneiss in many places, especially in north. The reduction in height from the great mountains o Kuenlun system on the west to the Tsinlingshan on the ea very marked, though the latter reach 10,983 ft. and its ave height is surprisingly great. The break between the Kue system and these mountains is a part of the great break see along the east side of the Tibetan plateau. The north face is steep, and loess reaches up to some 3,300 ft. above sea-lev places along it. The top of the range is broad, with sharp hei The south face has rounded heights and wild, deep-cut val In spite of its size and height the range is essentially one r and not a complex of chains such as we find, for example, in Alps. The Chinese were interested in and occupied the Han v in distant antiquity, but until a way was worked out across Tsinlingshan, these had to pass south-eastwards up the Tank a long detour if the ultimate goal were Han-chung-fu, or, perh Chengtu in Szechwan. The date of the first making of a across the range is in doubt as between 200 B.C. and A.D.

TSU-SHIMA, an island belonging to Japan, situated a midway between Korea and the island of Iki, so that the islands were used as places of call in former times by vessels ing between Japan and Korea. Tsu-shima lies about 34° 20 129° 20′ E. The nearest point of the Korean coast is 48 m. tant. It has an area of 262 sq.m. and a population of *c.* 42 It is divided at the waist by a deep sound (Asaji-ura), and southern section has two hills, Yatachi-yama and Shira-d 2,130 ft. and 1,680 ft. high respectively, while the northern tion has Ibeshi-yama and Mi-take, whose heights are 1,12 and 1,598 ft. The chief town is Izu-hara. The Mongol arm visited the island in the 13th century and committed great d dations. In 1861 an attempt was made by Russia to obtain a ing on the island. The name of the battle of Tsu-shima is to the great naval engagement of the 27th and 28th of May in which the Russian fleet under Admiral Rozhdestvensky defeated by the Japanese under Admiral Togo.

TUAM, a market town and episcopal city of Co. Ga Ireland, 20 m. N.N.E. of Galway on the Great Southern rail Pop. (1926) 3,288. It is the seat of a Roman Catholic bishopric, and of a Protestant bishopric. The cross of T re-erected in modern times, bears inscriptions in memory of

Conor, king of Ireland, and O'Hoisin, successively (1128) of St. Jarlath's Abbey and archbishop (1152) of Tuam, he see was raised. St. Jarlath's Roman Catholic college is ary founded in 1814 for the education of priests. To the e the archbishop's palace and a convent of Presentation The town received its first charter from James I.

AN CHI-JUI, Chinese politician, was born in Anhwei. ceeded Yuan Shih-kai as viceroy of the Hukuang Province, s one of the military leaders who signed the memorial of 11, urging the Emperor to abdicate. He was acting Premier lay to July 1913, Minister of War in 1914, and Premier in 916. In Oct. 1918 he resigned, and, after an ill-advised behalf of the Anfui Club, played no great part in national till Nov. 24, 1924, when he succeeded Tsao Kun as nt.

APSE, a town on the Black Sea in the North Caucasian 44° 10′ N., 38° 59′ E., linked by a branch line with r on the Rostov-Baku railway. It has oil refineries work- oil from the Grosniy district, to which a pipe line is being cted (1928). Its population has grown from about 1,000 to 12,142 in 1926.

AREG, also **TAWAREK** (sing. *Tarqi*), the name given os to the western and central Saharan Berber peoples in ert from Tuat to Timbuktu and from Fezzan to Zinder, an about 1,500,000 sq.m. The Tuareg resort to the centres hich the trade routes radiate, Timbuktu, Ghat, Ghadames, and Tuat. Their general colour is the reddish yellow of n Europeans, the uncovered parts of the body being, how- rker through exposure. Their hair is long, black and silky, black and thin, eyes black; blue eyes are recorded; light nd grey eyes are commoner; noses small, hands delicate, lies muscular. They are tall and graceful.

aristocratic section is called *Tmajagh;* Arabs call them *themin* (veiled people). The men wear the veil day and ne women never. The Tuareg, at any rate the noble class, ng the purest of the Berber stocks but have become largely d, though the nomad Tuareg preserve in singular purity the gh language of the Berber family. The script is known nagh, consists of 40 to 50 symbols, some of which have r Phoenician parallels. It may be written in various ways. ress generally in a black tunic (some wear white), trousers e cotton, and wear a cloth called *litham* or *tagilmus,* the which is drawn over the face, leaving visible only the eyes tip of the nose. These cloths are dark blue or white. In th the former is worn most by nobles, the latter by the n people. To this difference of colour is due the terms and "white" Tuaregs. The veil has, or had, some social nce. Social status is marked first by assuming the trousers, hen the sword is worn, 18, the stone ring put on, 18 to last the veil 22–25; marriage takes place late and Tuareg joy freedom.

lly the Tuareg are divided into six classes, viz.: *Imajeghan* es; *Marabout* or priests; *Imghad* or serfs; *Irejanaten* or people, issue of noble and Imghad; *Ikelan* negro slaves and tdoor slaves. The nobles are all pure blooded and provide al chiefs. They do no manual work but live either in con- those caravans which pay for safe passage, or by making trade routes or even outlying Arab settlements. Among had serfdom is hereditary, and they are bound collectively ole tribe or group of tribes. They cannot be sold or freed ves though they may be inherited. Most of them have l independence and act as "squires" to the nobles on their expeditions. The Tuareg weapons are a straight two- word about 4 ft. long, a dagger bound to the left forearm ather ring, and spears of two types and leathern shields. ing, wooden missiles like boomerangs are used.

Gautier, *Le* (1923); F. R. Rodd, *People of the Veil* (1926).

AT, a word sometimes applied generally to all the oases in the western part of the Algerian Sahara, *i.e.*, between 2° W. and 2½° E. 26° and 30° N., sometimes restricted to a particular group which borders the east side of Wad Messaud between 26⅛° and 27½° N. According to the first usage Tuat includes the oases of Gurara in the north and Tidikelt in the south with the important centre of Insalah. The three groups are spoken of collectively by the French as the Tuat archipelago. The district is comparatively fertile, and produces dates and some cereals and vegetables. The wadi Saura (known in its lower course as the Messaud), formed by the junction of the wadis Zusfana and Ghir, marks the north-western boundary of the oases. After the winter rains in the Atlas it carries a considerable body of water in its upper course, but lower down its channel is choked by sand. At Gurara water is obtained from springs brought to the surface by the outcrop of impervious Devonian rocks. There is an extensive *sebkha* or salt lake at Gurara. The inhabitants live in *ksurs* or fortified villages, grouped in districts. The Tuat group forms part of the Southern Territories of Algeria; Gurara and Tuat are attached to the territory of Ain Sefra and to the native commune of Timimun. Tidikelt to the Oasis territory and to the native commune of Wargla. The total population is 48,914, of which Gurara has 21,338, Tuat 17,493 and Tidikelt 10,329. The principal ksurs are in Gurara, Timimun (pop. 4,828), Deldoul (4,527) at Tuat, Timmi (3,037), Zaouïet-Kounta (2,948); at Tidikelt, In Salah (1,047), In Ghar (1,871). The district is of importance as commanding the routes southwards to Timbuktu and the Sudan.

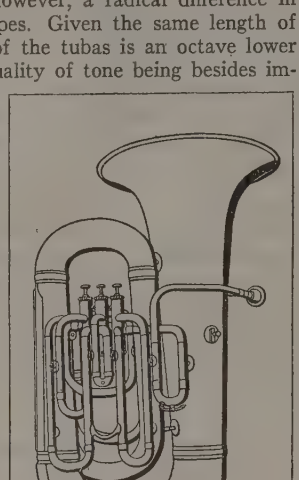
The oases appear to have been inhabited from a very early period. According to tradition numbers of Jews migrated thither in the 2nd century A.D. They were the predominant element in the oases when the conquests of Sidi Okba drove the Zenat south (7th century). These Berbers occupied Tuat and, to a large extent, absorbed the Jewish population. The Arabs took possession of the oases in the 10th century and imposed Islam upon the people. Thereafter the region was governed by Zenata Berbers or by Arab chieftains. The treaty of 1845 between Morocco and France left the question of the possession of Tuat, Gurara and Tidikelt unsettled. In 1899 a French scientific mission, under Flamand, was despatched to the oasis of Tidikelt. The French were attacked by the natives (Dec. 28, 1899), whom they defeated, and the next day Insalah was occupied. This was the beginning of a campaign which ended in March 1901 in the complete occupation of the oases and of the Zusfana-Saura line of communication, linking the oasis with the region of South Oran. The French were not, however, left in peaceable possession of their newly acquired territory. Attacks by the nomad tribes, Moroccan and others, were made on the line of communications, and during 1903 the French troops suffered serious losses. To punish the tribes the town of Figig was bombarded by the French (June 8, 1903). On the 2nd of September, following, a band of nomads attacked, at a place called El Mungar, the escort of a convoy going to Taghit. From 1904, the methods of governor Jonnart and of General Lyautey brought about rapid pacification. In 1905, the extension of the railway from South Oran to Colomb Bechar, which had been occupied in Nov. 1903, definitely stabilised French domination in that region.

Major A. G. Laing visited the Tuat territory in 1825 on his way to Timbuktu, but his papers were lost. The next European to visit Tuat was Gerhard Rohlfs, who described his explorations and investigations in *Tagebuch seiner Reise durch Marokko nach Tuat, 1864* (Gotha, 1865) and *Reise durch Marokko . . . Exploration der Oasen von Tafilet, Tuat und Tidikelt . . .* (Bremen, 1868). E. F. Gautier, *Sahara algérien* (Paris, 1908), Id. *La conquête du Sahara,* Paris, 1910; Id. *Le Sahara,* Paris, 1923; G. B. M. Flamand, *Recherches géologiques et géographiques sur le haut-pays de l'Oranie et sur le Sahara,* Lyon, 1911; Augustin Bernard and N. Lacroix, *La pénétration saharienne,* Alger, 1906; *Les territoires du Sud de l'Algérie* (publication du gouvernement général avec bibliographie et cartes) 3 vol., Alger, 1922.

TUATARA, the common name of the aberrant lizard-like reptile *Sphenodon* (*q.v.*) of New Zealand.

TUBA, in music, the tubas—bombardon, helicon, euphonium—are a family of valved instruments of powerful tone forming the tenor and bass of the brass wind. In the orchestra these instruments are called tubas; in military bands euphonium (tenor), bombardon and helicon (bass).

The modern tubas owe their existence to the invention of valves or pistons by two Prussians, Stölzel and Blümel, in 1815. The tubas are often confounded with the baritone and bass of the saxhorns, being like them the outcome of the application of valves to the bugle family. There is, however, a radical difference in construction between the two types. Given the same length of tubing, the fundamental octave of the tubas is an octave lower than that of the saxhorns, the quality of tone being besides immeasurably superior. This difference is entirely due to the proportions of the truncated cone of the bore and consequently of the column of air within. By increasing the calibre of the bore in proportion to the length of the tube it was found that the fundamental note or first sound of the harmonic series was easily obtained in a full rich quality, and by means of the valves, with this one note as a basis, a valuable pedal octave, absent in the saxhorns, is obtained. The instruments termed Wagner tubas are not included among the foregoing, these being really horns designed for Wagner in order to provide for the *Nibelungen Ring* a complete quartet having the horn timbre.



THE TUBA, THE DEEPEST TONED INSTRUMENT OF THE BRASS WIND FAMILY

The modern tuba finds its prototype as well as the origin of the name in the Roman tuba (the Greek *salpinx*). Compared with the other military service instruments of the Romans, the buccina and cornu, the tuba was straight and was used to sound the charge and retreat, and to encourage and lead the soldiers during action; it was sounded at the changing of the guard, as the signal to begin and leave off work, etc. It is represented, together with the buccina and cornu, on Trajan's column.

TUBE. This term generally refers to a hollow cylinder or pipe for conveying liquids or gases. In botany it denotes the narrow basal portion of a gamopetalous corolla or a gamosepalous calyx. For a discussion of the manufacture of metal tubing, both seamed and seamless, *see* the articles on IRON AND STEEL; CHEMICAL APPARATUS.

The manufacture and application of glass tubing is discussed under GLASS MANUFACTURE. Tubes for boilers (*i.e.*, fire tubing and water tubing), are treated under BOILERS and STEAM GENERATION. The term as used in the textile industry (*i.e.*, tube yarns), is found in articles related to textiles.

The application of the term to sub-surface transit is found in the article RAILWAYS, TUBE. The article PNEUMATIC CONVEYING treats the use of tubes in postal and similar services. Under TYRE various types of inner tubes for vehicles are described. The Coolidge Tube and tubes used for X-ray treatment and Radiotherapy are discussed under articles related to these subjects. The tubes used in lighting are discussed under LIGHTING AND ARTIFICIAL ILLUMINATION. For Estuary Tubes *see* AQUEDUCTS.

Perhaps the most common use of the word in recent years has been in connection with vacuum tubes used in the radio. These are discussed under THERMIONICS and THERMIONIC VALVES.

Many special tubes applying to different fields of science and industry are found under various headings in their related fields. One device, however, which deserves mention here is the Knowles Grid-Glow Tube or relay. This is a device for controlling electrical power which is so sensitive that it can be operated by the mere approach of the human hand. Superficially the Knowles Grid-Glow Tube resembles the radio tube for it has the anode, the cathode, and Grid. However, it has no filament; the connection of the anode and cathode are the reverse of the radio tube; the grid is merely a piece of heavy wire and the tube is filled with neon, argon, or some other gas. The ordinary relay is a device which is operated by a small current which controls a much l one. The relays commonly used in electrical engineering hav amplifying power of about 10,000, which means that they control a current 10,000 times greater than the current contro them. A Knowles Grid-Glow Tube has an amplifying pow the order of 100,000,000 and it is probably the most sens thing of the kind ever devised. The energy required to op it is about one one-thousand-millionth ($\frac{1}{1,000,000,000}$) of a This small amount of energy is sufficient to start a current high as 25 milli-amperes flowing through the tube. This cu is sufficient to close or open a switch of 25 amperes and th turn is ample for controlling almost any operation. It is possible by the use of this relay to turn on the lights of the start or stop a railway train, or manoeuvre a battleship. The is the invention of D. D. Knowles of the research staff o Westinghouse Electric and Manufacturing company.

TUBE RAILWAYS: *see* RAILWAYS, TUBE.

TUBERCULIN: *see* TUBERCULOSIS.

TUBERCULOSIS. Tuberculosis is a disease of man animals caused by the tubercle bacillus, which belongs to "acid-fast" group of bacteria, some of which are pathogenic others quite harmless. The most important pathogenic var are the "human," the "bovine" and the "avian." Whether are to be regarded as distinct organisms or merely as mutatio not yet settled but they are easily distinguished by their sele effects on test animals.

Fundamentally, tuberculosis consists in an inflammatory tion of any particular tissue to the invading bacilli, and tubercle bacilli are relatively little virulent, this tissue reacti subacute in character. It consists in the formation round bacilli of a microscopic agglomeration of cells constituting so-called "tubercle." In a typical tubercle there is usually a large or "giant" multi-nucleated cell in the centre, surrounde smaller epithelioid cells, and outside these again a zone of lym cytes. Blood vessels are completely absent, and the bacilli be contained within the giant cell or scattered among the Though in the earliest stage the tubercle is microscopic, several are formed close together they become visible to naked eye, and constitute the condition known as miliary tub from their supposed resemblance to millet seeds. Almost as as formed the tubercle undergoes central degeneration (c tion), believed to be directly caused by a toxin produced b bacilli, aided by the avascular character of the tubercle itself. further progress of the disease varies greatly according to resisting power of the individual and the presence or absen secondary, usually pyogenic, infection of the tuberculous f If resistance be low, and especially if pyogenic micrococci access, the focus becomes merely a specialized variety of ab and behaves like other abscesses, even, at times, to the exte invading the blood stream and leading to a generalized tub losis. If, on the contrary, resistance be high the inflamm reaction terminates in a reparative formation of fibrous tissue, often with local deposition of calcium salts. Between extremes are innumerable varieties according as one or condition predominates.

Tuberculosis, when it has reached the stage at which clinically recognizable, may be regarded as the end-result slow progressive and long unrecognized bacterial invasion should never be forgotten that, in the majority of infected sons in civilized communities, this clinically recognizable stage is never reached; in other words, only a relatively proportion of the number of infected persons actually bec clinically tuberculous.

Distribution Throughout the World.—A world-s shows that tuberculosis tends to be widespread in densely lated areas linked by commercial and social ties with the ou world, and is rare or absent in sparsely populated and cult isolated communities. Climatic, geological and racial fa appear to play a secondary part. Density of population, wit opportunities for frequent and close contact with infective pe which it involves, appears to be all-important in the dissemin of the germ, while wages, occupation, housing, diet, cli

ons and racial customs constitute ancillary factors of vary-nificance in so far as they bear upon the capacity of the ual to resist the infective dose or doses to which he has ubjected.

human tuberculosis, it is where men are herded together in tres of industry that the infection becomes so common as lmost universal. That this statement is true is proved by st-mortem findings of reliable pathologists in Europe and a who have investigated long series of cadavers of persons rom all diseases. In the words of M. Fishberg "no matter e cause of death may have been, whether the persons knew ad tuberculosis or not, between 50 and 100% of people n large cities show active, quiescent or healed tuberculous in some organ of their bodies."

e findings bring into sharp relief the importance of the dis- between infection and disease. The results of tuberculin pplied to healthy persons (Pollak, Vienna, 1911; Mantoux, 909 and 1910; Fishberg, New York, 1914; Calmette, Lille, ad others) show that, by the age of 15 years, nearly every ual living under urban conditions has already become d with the tubercle bacillus.

clear, therefore, that, in densely populated countries, ulous infection is far more widespread than tuberculous In sparsely populated and isolated countries, on the and, neither tuberculous infection nor tuberculous disease non. Borrel, for instance, found that only 3% of the Sene-soldiers summoned to Europe for the World War gave a e response to the tuberculin skin-test on arrival in France, numerous investigations carried out in the African and colonies and dependencies of the European Powers show rimitive tribes living under their natural conditions are free from tuberculosis.

as frequently been shown, however, that the members of rimitive communities, on quitting their native surroundings ming into contact with the "tuberculized" populations of , tend to show a marked susceptibility to tuberculosis; the course, in these cases, being of a rapidly progressive and fatal type.

ould seem, in fact, that, where there has been little or no s exposure to infection, the individual remains completely ected against tuberculous disease, while, on the other hand, manifest in the members of communities in which tuber- infection is widespread, a considerable power of resisting velopment of the tubercle bacillus and of rendering latent ve foci of infection.

ical Manifestations.—The primary clinical manifesta- f tuberculosis tend to vary with the portal of entry of the . In uninfected subjects, the germs can pass through the membranes of the respiratory and alimentary tracts, causing, at the moment, any marked local disturbance, eir transit thence is easy along lymphatic channels to the lymphatic glands. In these glandular filters, the tubercle end to be arrested and there they pullulate and set up the ci of disease.

formation of secondary foci of infection depends upon the of tubercle bacilli from their primary foci in the lymphatic to other tissues and organs. The presence of secondary us implies a generalization of the infection chiefly by way blood stream. This generalization can take place much asily in susceptible persons than in those who are more t, and in the young than the old. Thus the tendency to disseminated tuberculosis is much more marked amongst roups of individuals in which the "tuberculin test" shows hest proportion of negative results.

ne infants and young children of European and American nities, the proportion of bone and joint tuberculosis and of ulous meningitis is far higher than in adults; while, in the of "primitive" communities, brought for the first time into with infection, the same tendency to wide dissemination ns is always found.

reactive intolerance implied in a positive response to the ulin test which is only acquired as the result of a preceding infection, constitutes a factor of supreme importance in limiting the spread of tubercle bacilli within the body, by causing local inflammation, cell-proliferation and finally fibrosis, with arrest of the wandering germs and their confinement within a fibrous or calcified area. And this reactive intolerance is manifested, not only toward endogenous re-infection from pre-existing foci but to exogenous re-infection from outside the body.

Pulmonary Disease.—With this conception in mind, it is not difficult to understand why the tuberculosis of adult life in civilized and "tuberculized" communities usually takes the form of pulmonary disease. In the generalization of infection through the blood stream from the primary lymph-gland foci, the bacillary emboli must travel along the veins from the glands and since all the venous blood must necessarily pass through the capillary bed of the lungs before being re-distributed throughout the body, the lung tissue presents the first filter to be encountered by the blood-borne bacilli. It is into the lungs, too, that all contaminations are drawn in respiration. While both blood-borne and air-borne tubercle bacilli may pass unchecked through the "virgin" lung-tissue of children and non-infected adults, they tend, where "reactive intolerance" exists, to be arrested in the pulmonary tissue and to set up the inflammatory and ulcerative phenomena of phthisis.

I. IN GREAT BRITAIN

Changes in Clinical Type.—The statement is frequently made that the cases of pulmonary tuberculosis encountered 30 or so years ago were much more acute than those seen to-day, and a general impression exists amongst clinicians that phthisis is more acute even now in parts of Ireland, Scotland and Wales than in London and the big industrial centres. This clinical impression receives strong support from the statistical enquiries of J. Brownlee (M.R.C. Special Report Series No. 18, 1918), who has shown that, in males especially and to a less extent in females, the age-period of maximum death-rate has steadily receded from the "young adult" group to the "middle age" group in the succeeding decennia from 1851–60 to the present time.

This diminution of the "young adult" type of death-rate has, however, been less marked in certain counties of Ireland, Scotland and Wales, and indeed, in agricultural communities everywhere, than in the larger centres of population. Brownlee, in the report quoted, suggested that these differences might be due to the existence of para-tubercle bacilli of unequal virulence, but later researches by Tulloch have failed to discover any antigenic variants in a large series of "human" tubercle bacilli investigated by him. It may be assumed, therefore, that the recession of the age-period of maximum mortality from early adult to later life implies a more protracted clinical type of pulmonary tuberculosis now than formerly and in the larger centres of population as compared with the more sparsely populated agricultural districts.

Fall in Tuberculosis Mortality.—As will be seen from the appended table (extracted from the registrar general's *Statistical Review of England and Wales for the Year 1924*, Table 6, page 35) there has been, from 1838 onwards, a steady fall in the tuberculosis death-rate affecting both the pulmonary and all other forms of the disease. This fall, which has been observable in other civilized countries, though often claimed as evidence of the value of modern methods of prevention, was just as marked before the recognition of the infective nature of tuberculosis as after the discoveries of Villemin and R. Koch had given a definite direction to sanitary effort. Clearly therefore, some factor of natural adaptation must have been present to supplement the efforts of preventive medicine.

Those who favour the theory of an "hereditary disposition" to tuberculous infection see in this diminution of mortality the result of the dying off of susceptible stock and the survival of the more resistant. Others consider that, with the wide dissemination of infection resulting from the agglomeration of large numbers of persons into urban communities, there has been at work a factor of natural auto-immunization, individuals acquiring various degrees of resistance as the result of mild and repeated infections.

TABLE I. *Annual Mortality at All Ages per Million Persons Living*

Period	Tuberculosis (all forms)	Tuberculosis (of respiratory system)
1838–42 (5 years)	4,419	3,782
1847–50 (4 years)	3,714	2,889
1851–55	3,638	2,805
1856–60	3,323	2,572
1861–65	3,313	2,527
1866–70	3,201	2,447
1871–75	2,942	2,217
1876–80	2,817	2,038
1881–85	2,543	1,830
1886–90	2,324	1,635
1891–95	2,122	1,461
1896–1900	1,906	1,323
1901–05	1,743	1,218
1906–10	1,566	1,106
1911–15*	1,414	1,047
1916–20*	1,441	1,107
1921	1,126	884
1922	1,121	889
1923	1,062	836
1924	1,058	841
1925	1,038	833
1926	961	771

*The mortality for the years 1915–20 relates to civilians only.

In favour of the latter theory, it may be said that "acquired immunity" plays a part in limiting the spread of other bacterial diseases, that even the most susceptible animals may be made relatively resistant to tuberculosis through mild laboratory infections and that a high degree of resistance in any given community, as evidenced by a relatively low death-rate and a relatively chronic clinical type, goes hand in hand with a wide diffusion of infection as proved by tuberculin tests.

Prevention.—Man is liable to infection from two main sources, the first and infinitely the more important being infected persons and the second, milk from infected cows.

Not all infected persons are equally infective. Those suffering from the chronic type of pulmonary disease with cavities are, perhaps, the most dangerous of all, such cases producing, as a rule, copious expectoration of a sputum heavily charged with bacilli while, being relatively resistant, they often survive for years and are well enough to remain at home. There exist, too, cases whose symptoms are more suggestive of chronic bronchitis or asthma than of tuberculosis and who consequently remain undiagnosed, no precautions being taken. Not only the sputum of such persons but the droplets emitted in coughing and talking are sources of danger to others, while the excreted bacilli may accumulate on the clothing and bedding used by them and in the apartments which they occupy.

Such persons establish the greatest concentration of infective matter within the home, and the smaller, the worse ventilated and the more crowded the home, the more massive the infection and the more serious the danger to others. In the home contact with susceptible persons is most likely—for the home is the nest for infants and young children. It is upon the homes and the families of infected persons that preventive measures must be focussed.

Adequate provision of hospital and sanatorium accommodation is also a prime necessity so that infected persons may be removed from amongst their still healthy relatives. The use of sputum flasks, the ventilation of rooms, provision of good food for dependants—all these will help. In France, promising results are being attained on the Grancher System by which the young children of tuberculous parents are placed with selected foster parents in country districts.

Another interesting line of prophylactic effort now under trial in France is the protection of the infants born to tuberculous parents by "vaccination" with living but attenuated tubercle bacilli. A. Calmette and C. Guerin have succeeded, by special cultural methods, in so reducing the virulence of a selected bacillary strain that it no longer produces tuberculosis but r a transitory and benign infective process accompanied, ho by the development, in experimental animals, of a high of resistance against re-infection by virulent strains. This v of Calmette (B.C.G.) is now being administered not o calves but to the infants of tuberculous parents shortly birth. So favourable have been the results of experime laboratory animals that there are grounds for hope as t vention of human and bovine tuberculosis. Results publish Calmette and his co-workers have, however, been criticiz statistical grounds (notably by A. Wallgren in *Acta Ped* 1927, vii., 120) and it will take years to evaluate the s or failure of these experiments. In the interval, the want specific preventive measure throws us back upon general ures of hygiene, attempts to diminish the pool of infectiv sons by improved methods of treatment and the super control and, where possible, isolation of infected persons th the machinery of the tuberculosis schemes of local auth and by precautions against the sale or the use of milk cont living tubercle bacilli.

General measures of hygiene find their most important cation in arrangements for the conscientious notificati diagnosed cases, the inspection of "contacts," the medical i tion of school children, the provision of "clean milk," the ment of housing, the adequate disinfection of contam articles and places and tactful and efficient "health visitin

Recent Methods of Treatment.—Symptomatic trea while often affording relief, cannot cure. Even "specific" ment aiming at the production of immunity, while helpful tain patients, has proved disappointing. Tuberculin, in its forms, is no longer regarded as "a cure in the strict sense term" and is not entirely free from risk. The natural po the human body to amplify its powers of resistance is very and many cases do well if placed under favourable con of life. In this lies the secret of "sanatorium treatment" in the mode of life of the patient is carefully adjusted to the imposed by his disease. Within these limits he can exerci work with benefit to himself and an increase in the am of his resistance. For the more favourable types of pulm cases, sanatorium treatment offers a very definite prosp restoration to average health and working capacity. Al so much stress is laid on controlled exercise and work, th of the treatment is *rest*. In the case of "surgical tuberc too, where the bones and joints of the body are affected, v in rest the greatest of all adjuvants to recovery. A study results attained at such English centres as the Treloar H for Cripples at Alton, the Shropshire Orthopaedic hospit North Wales sanatorium and the Metropolitan Asylums' hospital at Carshalton will suffice to prove the curability gical tuberculosis in children by judicious immobilizatio rest. Fresh air (*see* PUBLIC HEALTH), sunlight (*see* THERAPY) and also the artificial sunlight produced by arc are being used, more and more, to help on the results of ment by surgical rest, and wonderfully favourable resu already claimed for these methods.

In pulmonary tuberculosis, too, the method of "surgica for the affected part is applicable where the disease is c or almost confined to one lung; and new vistas are being up through the use of artificial pneumothorax, apecolys thoracoplasty. Nothing is more certain than that the s treatment of pulmonary tuberculosis is destined to play creasingly beneficent part in the future. But, while al methods are of proven value in appropriate cases, none o can be claimed as a cure, and it is to Chemiotherapy t turn in our hope for the future.

Robert Koch found that salts of certain metals, and esp gold, had a lethal effect on the tubercle bacillus but only centrations which were also deleterious to the tissues. R however, has continued on these lines, and Prof. Möllgaa Copenhagen, has succeeded in producing a gold compound, aurothiosulphate or Sanocrysin, which, while still under te pears to have a definitely lethal effect on tubercle bacilli

or animal body, in concentrations which are non-toxic patient. Here, again, we appear to be upon the threshold eat advance in the treatment of tuberculosis. The method, er, is not without danger. (*See* THERAPEUTICS.)

erculosis Schemes.—Up to the end of 1910, the work of tuberculosis in Great Britain was left, for the most part, initiative of the more progressive local authorities, supple- by private enterprise and the work of voluntary organiza- Much knowledge was accumulated through the work of yal Commissions of 1890 and 1901 and through the ac- of the Local Government Board, but there was no co- ed national effort to deal with the disease.

Nov. 1911, it was made incumbent on every medical prac- attending on or called to visit any person suffering from nary tuberculosis to notify the case immediately to the l officer of health concerned. These regulations, the out- of orders by the Local Government Board of Dec. 1908, ade applicable to *all forms* of tuberculosis in Dec. 1912.

911, too, the National Insurance Act made provision for ium benefit for insured persons, the Local Government being empowered to authorize county councils to provide, in and manage institutions for the treatment of tubercu- Under the Finance Act, 1911, and the Insurance Act, a £1,500,000 became available for provision of or grants toward sanatoria and other tuberculosis institutions while vernment undertook to pay 50% of the annual cost of ti-tuberculosis work carried out by local authorities. The Health (Tuberculosis) Act of 1921 placed a statutory ion on each county and county borough council to make ements for the treatment of all persons suffering from ulosis, whether insured or not.

lly, in 1911, a departmental committee, presided over by (now Lord) Astor, was appointed to report on the gen- olicy in regard to tuberculosis in its preventive, curative her aspects. The tuberculosis schemes now operative here throughout England, Scotland and Wales are based, on the report of the Departmental Committee.

units in a complete scheme are as follows:

he Tuberculosis Dispensary or Institute.—The functions unit are to be "a receiving and clearing-house and a centre gnosis, consultation and observation, where persons can hemselves of the services of specially qualified medical On the dispensary or institute is based, too, the work of berculosis nurses and visitors "who advise and instruct s in a hygienic mode of life" and help the tuberculosis to keep in touch with the homes of tuberculous cases.

Year ended March 31, 1927	2,972,357	315,358	2,696,112

ultimate economy would seem to lie in the endowment of research directed towards preventive measures and curative treatment.

(S. L. C.)

United States.—During the present century tuberculosis has been a declining disease in all industrialized nations. A moderate though rather steady fall in its death-rate was interrupted by the World War, when all countries involved experienced increases of mortality that were roughly proportionate to the stresses and deprivations (as of food and shelter) incident to the conflict. After 1918 the decline in mortality reappeared at an accelerated pace and to an unprecedented degree.

This universal recession of the age-long principal cause of death was most pronounced in the United States. Here its outstanding features may be summarized as follows: (1) a drop in the tuberculosis death-rate from 202 per 100,000 population in 1900 to 80·7 in 1927. (2) An estimated total of 102,000 deaths among a population of approximately 117,000,000 in 1927 as compared with upward of 154,000 deaths among only 76,000,000 people in 1900. (3) Almost a million and a half fewer deaths from tuberculosis during 1900–25 than if the old high rate of 1900 had continued throughout the period. (4) The retreat of tuberculosis from first to fifth place as a cause of death. Until 1912 it had always been the most mortal of all diseases; in 1914 it yielded up this position permanently; and since 1924 it has been outranked by the classifications Diseases of the Heart, Pneumonia (all forms), Cancer and either Cerebral Haemorrhage or Nephritis.

This unexampled diminution of a formerly entrenched principal disease has attended a development and perfection of sanatoria for its treatment that have far outstripped similar efforts in any other country. Thirty-four of these institutions, with 4,485 beds, in 1900, had by 1910 grown to 145 with 20,195 beds and by 1925 to over 600, with facilities for 73,715 patients (including 13,401 under the auspices of the Federal Government). At present about 150,000 new patients with tuberculosis are being admitted to sanatoria annually, and Drolet has estimated that, up to 1926, a total of 1,234,000 individual patients had received treatment in the tuberculosis sanatoria of the United States.

As between the several States the disease varies widely in both

mortality and morbidity. Colorado, to which sufferers resort for climatic treatment, has long had the highest death-rate, while Utah, adjoining it, has reported the lowest rate (39 for 1924). In general, tuberculosis mortality is normally highest in the Southern States as a group, particularly those with relatively larger urban population (Kentucky, Maryland, Tennessee, Louisiana, Virginia). The high rates of these States are the direct result of the exaggerated toll of tuberculosis among their city negroes, for whom the disease is two to three times as deadly as for the whites. Nevertheless, encouragement is to be found in the fact that the tuberculosis mortality of the negro is also declining markedly.

The recent radical restriction of immigration has not been in effect long enough to disclose its influence on the nation's tuberculosis. In former times of unrestrained immigration, the pouring of new thousands of young and vigorous members of European stocks into the great Atlantic ports probably operated toward a reduction of local mortality by dilution of population. In general, the Russian Jews appeared to weather American urban life best, so far as tuberculosis was concerned, and in New York city would consistently show death-rates for the disease below those of the general community. Next usually came Italians, French (many from Canada), Germans and English, with rates not much higher than those for native American stock. The Irish have been notably prey to tuberculosis on American soil, while the Finns, whose numbers are small, have had rates almost as high as the negroes in New York city. Any attempts to explain these national (rather than racial) differences must no doubt take into consideration such a prime factor as relative adaptability to American life.

The diminution of mortality has been most pronounced in the large cities. For instance, in 1900 the tuberculosis death-rate for New York city was 39% in excess of that for the general population of the country (death registration area). By 1925 this disparity had fallen to 7% and exhaustive analysis will show that it represents a general phenomenon. There is no longer any doubt that tuberculosis is declining more rapidly in the cities than in the country districts of the United States.

It is also declining most at the earlier ages of life; that is, more among infants under two years of age than among children, and more among the latter than among the general population. In New York city the death-rate for infants in 1923 was only one-sixth that of 1898 (94 in 1923 and 609 in 1898), while for children under 15 the decline was from 136 to 33; meanwhile the rate for the general population was cut in three.

The forces that are combining to bring tuberculosis under control in the United States are by no means clear. They are, no doubt, numerous and complex. That the sanatoria are playing their part can hardly be questioned. These institutions annually remove tens of thousands of the ill from active life and thus interrupt innumerable infectious contacts between the sick and the healthy. They, meanwhile, train the patients in habits of better health and return them to the community as living object-lessons of the benefits of a hygienic regimen. That the American people have accepted the sanatorium movement is evidenced by the tens of millions of dollars that they are providing out of public funds for the founding and maintenance of sanatoria.

The sanatorium movement in the United States is the outgrowth of organized propaganda set in motion by the National Tuberculosis Association established in 1904. The efforts of this organization, working through its affiliated local societies, entered into every hamlet. For 25 years it has exhorted the people continuously on practices designed to avoid and treat tuberculosis, maintaining services and agencies to be applied to every phase of the disease. Its funds are recruited through the unique manner of selling, every year at Christmas-time, the so-called "Christmas Seals," stamps to be affixed to postal matter but not for postage. Their sale has become so enormous as to bring an annual gross return of over $5,000,000 though they cost but a cent each.

Working toward the reduction of tuberculosis must also be regarded the amelioration of existence and the rise of the standards of living that have characterized our era and which have, in turn, flowed from the extraordinary multiplication of national personal wealth in the United States. These resultants of industrial age have served to cut down tuberculosis; organ endeavour has been alive to their influence and for its own poses has moulded them to greater effectiveness.

In the United States sanatorium regimen is synonymous treatment of the disease to a degree that is unmatched elsew in the world. The attitude of the medical profession toward n and more special modes of therapy has been, in general, conservative than that of their European *confrères*. How artificial pneumothorax and the more radical surgical meas (thoracoplasty, phrenicotomy, pneumolysis, etc.) have bec standard procedures in selected cases of pulmonary tubercu and are in general usage. Heliotherapy and other forms of treatment are universally employed in non-pulmonary dise their utility in phthisis has not won the same general appr and at present the weight of opinion advises awaiting more gible results before expressing final judgment. Specific treat (tuberculin), valuable only in expert hands, holds its own most settled field embraces certain forms of ocular tubercul Chemotherapy has made no headway.

The X-ray is universally recognized as indispensable in nosis, but each succeeding year strengthens the conviction röntgenography cannot supplant tried and standard met of physical examination, but, on the contrary, gains in u only as it is brought into co-ordination with the latter. Of many specific and laboratory tests only the long-recogn demonstration of tubercle bacilli in tissue products is regarde decisive in diagnosis.

The spirit of study and research of the disease has devel enormously. It was given great impetus by *The American Re of Tuberculosis*, a monthly scientific periodical, founded in by the National Tuberculosis Association. Among the more pr nent centres of research in tuberculosis are the Trudeau Fou tion at Saranac Lake, the Henry Phipps institute at Philadel the Kenneth Dows laboratories of the Johns Hopkins unive at Baltimore, the National Jewish hospital at Denver, the mu pal sanatorium at Chicago, the Lymanhurst School for Chil at Minneapolis and the Colorado foundation at Colorado Spr all of which were established since 1910. (A. K. K

CKER, ABRAHAM (1705–1774), English moralist, ɔrn in London, of a Somerset family, on Sept. 2, 1705, a wealthy city merchant. He studied at Merton college, , and in 1727 settled down as a county gentleman at Betch- castle, near Dorking. His chief work was *The Light of Pursued* (7 vols. 1,765 pp.), which was completed but not t published when he died on the 20th of November, 1774. ome important points Tucker anticipates the utilitarianism ards systematized by Paley. "Every man's own satisfac- Tucker holds to be the ultimate end of action; and satis- or pleasure is one and the same in kind, however much it ary in degree. This universal motive is further connected, Paley, through the will of God, with the "general good, the here out all our rules of conduct and sentiments of honour branch."

Light of Nature was republished with a biographical sketch cker's grandson, Sir H. P. St. John Mildmay (1905), 7 vols. editions 1834, 1836, etc.), and an abridged edition by W. appeared in 1807. *See* James Mackintosh, *Dissertation on rogress of Ethical Philosophy* (Edinburgh, 1832); and ly Sir Leslie Stephen, *English Thought in the 18th Century,* 9–130.

CSON (tōō-sŏn′), a city in southeastern Arizona, lying in oad valley of the Santa Cruz river. It is about 2,400 ft. sea level and is sheltered by mountains 5,000–9,000 ft. high. 1910) 13,193; (1920) 20,292; (1925, Census Bureau esti- 26,733. In 1920 5,181 were foreign-born, of which 82% Mexicans. Tucson has many irrigated farms in its vicinity the centre of one of the oldest agricultural districts of the Its climate is dry, mild and equable and attracts many visitors. It is on the main line of the Southern Pacific y and is also the northern terminus of the Southern Pacific xico railway, which gives direct service to Guadalajara and o City. The Southern Pacific has its division headquarters pair shops in the city.

University of Arizona (1891; non-sectarian, coeducational) es a campus of 75 ac. upon a high hill in the northeastern f the city. Its attendance increased from 201 in 1909 to in the winter session 1926–27. There are 22 buildings, 11 n built since 1910. Among them are the University library, ning 70,000 volumes, and Steward Observatory. Connected he university is the State Museum, which houses extensive ological and natural history collections. At Tucson are also uthwest experiment station of the U. S. Bureau of Mines desert botanical laboratory maintained by the Carnegie In- on of Washington. In 1900 Tucson became the see of a n Catholic bishop and the church maintains a cathedral, seph's Academy and San Xavier Mission for Indians. The city has an excellent Carnegie library.

In the immediate vicinity lie ruined villages of the ancient Pueblo peoples. In history Tucson is first heard of in 1699 as an Indian rancheria or settlement. In 1763 it was a *visita* of the Jesuit mission of San Xavier del Bac, founded between 1720 and 1732, 9 m. south of Tucson. It was made a presidio (San Augustin del Tugison), or military outpost in 1776, and, although a few Spaniards may have lived there before, the founding of Tucson as a Spanish town dates from this time. It was never afterward abandoned during the Indian Wars. The first decade of the 19th century was the apex of its prosperity under Spanish rule, and its population was between 2,000 and 3,000 people. By 1848 this number had dwindled to 760. Tucson lay within the territory acquired by the United States by the Gadsen Purchase in 1853. It was occupied by the United States in 1856, and with the arrival of American troops and traders a new era of prosperity began. In the 60's and 70's the place witnessed considerable commercial activity, it being a general pack-train centre. In 1860 the *Weekly Arizonian,* the first newspaper in the State, was established there. Fort Lowell, 7 m. north-east of the city, was built in 1873 as a protection against the Apache Indians; it was abandoned in 1891. Tucson was occupied by the Confederates in Feb. 1862, and by the Union forces in May. It was the territorial capital from 1867 to 1877. The Southern Pacific railway arrived from the West in 1880, and in 1910 the connection with the Mexican railways was made. Tucson was chartered as a city in 1883.

TUCUMÁN, a northern province of Argentina, bounded N. by Salta, E. by Santiago del Estero, S. and W. by Catamarca. Area, 10,422 sq.m. Pop. (1924), 332,933; 1927 estimate, 409,358. The Sierra de Aconquija is on the western frontier of the province and there is also broken country in the north, but in the east the country is flat, alluvial and very fertile. The only large river is the Salí, or Dulce, which receives a large number of small streams from the Sierra de Aconquija and flows through Santiago del Estero to the Porongos lagoons on the frontier of Córdoba. Tucumán's main industry is the production of sugar. Nearly a million acres of irrigated land in this province are devoted to the raising of cane and there are some 30 mills operating. About 85% of the Argentine supply comes from this region, which yields an annual average of 500 million pounds of sugar as well as some seven million gallons of alcohol made from the residue of the cane.

TUCUMÁN or **SAN MIGUEL DE TUCUMÁN,** a city of Argentina, capital of the province of Tucumán, on the right bank of the Salí, or Dulce river, 780 m. by rail N.W. of Buenos Aires, in lat. 26° 50′ S., long. 64° 35′ W. Pop. (1914) 91,216. The climate is warm. A summer maximum of 104° F has been recorded, and frosts occur in occasional winters. The rainfall, which occurs almost wholly between September and April is moderate, about 30 in. per year. Malarial diseases, especially "chucho" (fever and ague), are common. Tucumán is laid out in regular squares, and still retains many of its old characteristics, low buildings enclosing large courts (*patios*), with large rooms, thick walls and tile roofs.

Tucumán was founded in 1565 by Diego Villaruel at the confluence of the Salí and Monteros rivers, but frequent inundations led to a removal to its present site in 1585. In 1680 it succeeded Santiago del Estero as the capital of the province of Tucumán, then under the government of the Spanish viceroy at Lima. The province of Tucumán then extended from Jujuy south to Córdoba. In 1776 the viceroyalty of La Plata was created and Tucumán was transferred to its jurisdiction. In 1816 a convention of delegates from the La Plata provinces met in Tucumán and signed (July 9) an act of independence, which formally dissolved all ties with the mother country.

TUDELA, a town of northern Spain, in the province of Navarre, on the Saragossa-Logroño and Tudela-Tarazona railways, and on the right bank of the river Ebro, which is here joined by its tributary the Queiles. Pop. (1920), 10,362. Tudela, the Roman *Tutela,* was taken from the Moors by Alphonso I. of Aragon in 1114. The town was an episcopal see from 1783 to 1851. The

Ebro is here crossed by an ancient bridge of 19 arches. The Romanesque collegiate church, Santa Maria, founded in 1135 and consecrated in 1188 is one of the most perfect in northern Spain. There are many sawmills in the town, and an active timber trade.

TUDOR (Family). The house of Tudor, which gave five sovereigns to England, is derived by all the Welsh genealogists from Ednyfed Vychan of Tregarnedd in Anglesey, who is named in 1232 as steward of Llywelyn, prince of North Wales, and seven years later, as an arbitrator in a convention to which Davydd, the son of Llywelyn, was a party. Tudor Vychan ap Gronw of Trecastell was the father of four sons, of whom the eldest, Gronw Vychan, was in favour with the Black Prince and with Richard II. He was forester of Snowdon and steward of the bishop of Bangor's lordship in Anglesey. He died in 1382, an infant son being heir to his lands in Penmynydd, whose sister carried them to her husband Gwylym ap Gmffydd of Penrhyn.

Gronw's brothers Gwylym and Rhys served Richard II. as captains of archers. Their youngest brother, Meredydd ap Tudor, escheator of Anglesey in 1392 and, like Gronw, an officer of the household of the bishop of Bangor, is said to have slain a man and fled to the wild country about Snowdon. He was the father of the handsome Owen ap Meredydd, commonly called Owen Tudor, a squire who appeared at the court of the infant king Henry VI., and attracted the admiration of the queen mother. About 1428 or 1429, it must have been common knowledge that Owen Tudor and Queen Catherine were living as man and wife. There is no direct evidence for their marriage. An act had but lately been passed for making it a grave offence to marry with the queen dowager without the royal consent: this act is said to have been afterwards cut out from the statute book. Richard III. denounced his rival Richmond as the son of a bastard, but it must be remembered that Richard was ready to foul the memory of his own mother in order to say the same of the young Edward V. But no one yet has found time or place of Owen Tudor's marriage with Catherine of France.

Five children were born to them, the sons being Edmund and Jasper and another son who became a monk. In 1436, a date which suggests that Bedford had been Owen's protector, the influence of Gloucester was uppermost. In that year the queen dowager was received within Bermondsey Abbey, where she died in the following January. Her children were taken from her, and Owen Tudor "the which dwelled with the said queen" was ordered to come into the king's presence. He had already seen the inside of Newgate gaol, and he would not obey without a safe conduct. When he had the safe conduct sent him he came up from Daventry and went at once to sanctuary at Westminster, whence even the temptations of the tavern would not draw him. Allowed to go back to Wales, he was retaken and lodged again in Newgate. He broke prison again and returned to his native Wales. When Henry VI. came of full age he made some provision for his stepfather, who fought on the Lancastrian side. At Mortimer's Cross (Feb. 4, 1461) Owen fell into the hands of the Yorkists, who beheaded him in Hereford market place.

His eldest son, Edmund of Hadham (b. *c.* 1430), was knighted in 1449, and in 1453 he was summoned as earl of Richmond. He was declared of legitimate birth, and in 1455 he married Lady Margaret, daughter of John Beaufort, duke of Somerset. His only child, afterwards Henry VII., was born three months after his death.

Edmund's younger brother, Jasper Tudor, survived him many years. Jasper was knighted in 1449 and, about the date of Edmund's patent, was created earl of Pembroke. He bore the royal arms of France and England, differenced with a blue border charged with the royal martlets of the Confessor's fabulous shield, and the same was formerly to be seen upon his Garter stall-plate of 1459. He fought at St. Albans in 1455 for the king who had advanced him, and two years later we find him strengthening the defences of Tenby. In 1460 he seized Denbigh, where the queen joined him after Northampton. He shared the defeat at Mortimer's Cross and left the country in 1462. In 1465 he made a last descent upon Wales, to be driven off by William Herbert, who was rewarded with his earldom of Pembroke, already forfeited by attainder. He came back again with Warwick in 1470 and hurrying to join the queen when Tewkesbury was fought and After many adventures he carried off his young nephew Richm to Brittany. The two came back together in 1485. After worth, Jasper was created duke of Bedford and restored to earldom, the earl-marshalship being given him in 1492. He to fight at Stoke in 1487 against Lincoln and Simnel his pu and to be one of the leaders of the host that landed in Franc 1492. He died in 1495 leaving no issue by his wife Catherine widow of the second duke of Buckingham and a daughter of R ard Widvile, Earl Rivers. But his bastard daughter Ellen is to have been mother of Stephen Gardiner, bishop of Winchest

TUDOR PERIOD, in architecture and the decorative a loose term covering the final phase of Perpendicular Go and the earlier phases of Elizabethan or even Jacobean w from which it is usually differentiated by the fact that t examples in which the Gothic influence predominates are ter Tudor, while those in which classic influence is more noticeable known as Elizabethan or Jacobean. Since the Gothic tradition sisted in various parts of England and especially in Oxford Cambridge until late in the 17th century, it is difficult to as date limits to the Tudor style. In ecclesiastical architecture Tudor period saw the climax of Perpendicular development. Perpendicular Period.) The characteristics in exterior sec work are: large groups of rectangular windows; rich oriel or windows; interesting and sometimes fantastic chimney t ments; complex roofs with many gables; much brickwork, quently in patterns and lavish half-timber (*q.v.*). In int secular work this period saw an extraordinary developmen wood panelling which was frequently used to cover all four s of a room, and often enriched with linen-fold (*q.v.*) decora and occasional naïve travesties of classic forms and the lavish of moulded plaster-work for ceilings, cornices and walls. C acteristic examples of the style are: the older portions of Ha ton Court palace (1515–25); Layer Marney (1522–25); Mor Old Hall, Cheshire (1550); Compton Winyates (*c.* 1520); ton Agnes (1602–10); Ford's hospital, Coventry (begun 15 at Oxford, Corpus Christi college (1516), the Founder's to (1492–1505) and the hall (1541) at Magdalen, the tower of old examination schools (*c.* 1620) and the chapel of Oriel (16 at Cambridge, Queens' college (*c.* 1450), the two earliest court S. John's (between 1511 and 1600), and the King's gateway Great Court at Trinity (built between 1518 and 1605).

(T. F. H

TUFF, a rock consisting of volcanic ash, the ejectam of craters in a state of eruption (Ital. *tufo*). The products volcanic eruption may be classified into (*a*) steam and o gases, (*b*) lavas, (*c*) ashes. The ashes have not been burnt in way, though they resemble cinders in appearance; they are me porous, slaggy pieces of lava which have been tossed into the and have become vesicular by the expansion of the gases wi them while they were still plastic.

Among the loose beds of ash which cover the slopes of m volcanoes, three classes of materials are represented. In addi to true ashes (*a*) of the kind above described, there are lump the old lavas and tuffs (*b*) forming the walls of the crater, and which have been torn away by the violent outbursts of ste pieces of sedimentary rocks (*c*) from the deeper parts of volcano, which were dislodged by the rising lava, and are o intensely baked and recrystallized by the heat to which they h been subjected. In some great volcanic explosions nothing materials of the second kind were emitted, as at Bandai Japan, in 1888. There have been many eruptions also at w the quantity of broken sedimentary rocks mingled with the a is very great; as instances we may cite the volcanoes of Eifel and the Devonian tuffs, known as "Schalsteins" in Germa In the Scottish coalfields some old volcanoes are plugged v masses consisting entirely of sedimentary débris; in such a we must suppose that no lava was ejected, but the cause of eruption was the sudden liberation and expansion of a l quantity of steam. These accessory or adventitious mater however, as distinguished from the true ashes, tend to occu

fragments; and when they form a large part of the mass
k is more properly a "volcanic breccia" than a tuff. The
ry in size from large blocks 20 ft. or more in diameter to
nutest impalpable dust. The large masses are called
"; they have mostly a rounded, elliptical or pear-shaped
wing to rotation in the air while still viscous. Many of
ve ribbed or nodular surfaces, and sometimes (at Vulcano
nt Pelée) a crust intersected by many cracks like the sur-
a loaf of bread. Any ash in which they are very abundant
l an agglomerate (*q.v.*).

ose layers and beds of tuff which have been spread over
rable tracts of country and which are most frequently
ered among the sedimentary rocks, smaller fragments pre-
te greatly, and bombs more than a few inches in diameter
absent altogether. A tuff of recent origin is generally loose
oherent, but the older tuffs have been, in most cases,
d together by pressure and the action of infiltrating water,
rocks which, while not very hard, are strong enough to be
r building purposes (*e.g.*, in the neighbourhood of Rome).
have accumulated sub-aerially, like the ash beds found on
Vesuvius at the present day, tuffs consist almost wholly
anic materials of different degrees of fineness with pieces
d and vegetable matter, land shells, etc. But many vol-
stand near the sea, and the ashes cast out by them are
l with the sediments that are gathering at the bottom of
ers. In this way ashy muds or sands, or even in some
shy limestones are being formed. As a matter of fact
f the tuffs found in the older formations contain admix-
f clay, sand and sometimes fossil shells, which prove that
ere beds spread out under water.

t from adventitious material, such as fragments of the
ocks, pieces of trees, etc., the contents of an ash deposit
described as consisting of more or less crystalline igneous
If the lava within the crater has been at such a tempera-
at solidification has commenced, crystals are usually pres-
hey may be of considerable size like the grey, rounded
crystals found on the sides of Vesuvius; many of these
y perfect and rich in faces, because they grew in a medium
was liquid and not very viscous. Good crystals of augite
vine are also to be obtained in the ash beds of Vesuvius
many other volcanoes; blocks of crystalline minerals (an-
olivine, augite and hornblende) are common objects in
fs of many of the West Indian volcanoes. Where crystals
y abundant the ashes are called "crystal tuffs." In St.
and Martinique in 1902 much of the dust was composed
ute crystals enclosed in thin films of glass, because the
the moment of eruption had very nearly solidified as a
ine mass. Some basaltic volcanoes, on the other hand,
ected great quantities of black glassy scoriae, which, after
dation, weather to a red soft rock known as palagonite;
this kind occur in Iceland and Sicily.

ographically tuffs are classified according to the nature of
canic rock of which they consist; this is the same as the
panying lavas if any of these were emitted during an
n, and if there is a change in the kind of lava which is
out, the tuffs indicate this equally clearly. Rhyolite-,
e-, andesite-, and basalt-tuffs are thus the most frequently
ng pyroclastic rocks of the present day. Tuffs are well
nted in the stratigraphical record ranging from the Pre-
ian to Recent. The older tuffs are most often greatly
d by silicification and devitrification. They may be com-
metamorphosed with loss of all original textures and can
nly be recognized by their chemical composition and field
nships. Many chlorite and hornblende schists in meta-
ic regions represent recrystallized ash beds of basaltic
ter. The Swedish hälleflintas (*q.v.*) include rocks of pyro-
origin of the nature of rhyolite-tuffs, but they are com-
changed by recrystallization to a granular assemblage of
, felspar, mica, etc. (*See* VOLCANO.) (J. S. F.)

FU (杜甫, A.D. 713–770), a Chinese poet and painter of
ang dynasty, considered by some Chinese critics as the
ne poet. Tu Fu was born in Tu Ling in the Shensi prov-
ince, and is therefore often called Tu Shao-Ling (杜少陵), although his father was a native of Hsiangyang in Hupeh. His family belonged to the military and literary class. At 15, his essays and fantastic verses won great admiration. After ten years of wandering, he went to the capital, Changan (長安), for his literary examinations. Although his written papers were excellent he was not given a degree, as his views were unorthodox. He then became a wanderer, and on the "Lute Terrace" in Ching Hsien, he met his much admired friend Li Po, whom he immortalized in verse.

In 749 the emperor (玄宗) invited all great scholars for examination. Tu Fu presented himself, but waited for four years until he managed to please the emperor with his three great *fu* (三大禮賦, a form of verse in six syllables in each line). He was given a post in the Chih Hsien library which he held for four years, he was then promoted to another post at Fêng-hsien. In 758, when the rebellion of An Lu-Shan (安祿山), which drove the emperor Ming Huang from the throne, broke out, he was exiled and went to live with a relative at White Water village (鄜州).

When a new emperor ascended the Dragon throne, Tu Fu went to pay his respects to him, but on the way he was captured by brigands, beaten, and made prisoner for a year. He escaped, and, emaciated and clad in rags, he reached the emperor. He was appointed to the post of censor, but fell into disgrace and was delegated to a minor post as governor of a small town in Shensi. This position he did not accept, and joined his family at Kansu. They were struggling for existence, and the poet supported them by digging up roots for food and by selling firewood. Several of his children, however, died of hunger. After six months in office in Hua Chou, he retired to Chêngtu in Szechwan, living in a house of grass roots. Here he wrote some of his most beautiful lyrics.

In 768 he took up nomadic life once more. He was caught by floods and compelled to go into a ruined temple at Hu Huang without food. After ten days' starvation he was given a feast by the local officials, and died (770) of over-eating.

TUGELA, the largest river in Natal, its basin being about 8,000 sq.m. in extent. It rises on Mont aux Sources, in the Drakensberg, at over 10,000 ft. above sea-level. After a mile or two it plunges over the great escarpment forming the most rugged and picturesque scenery, and then flows as a dignified stream in a broad, open valley to a point a few miles below Colenso, about 60 m. eastward from the source. Here the valley becomes steeper and narrower, owing to rejuvenation. This character persists until within a few miles of its mouth, the river being sometimes 2,000 ft. below the neighbouring plateau. The Tugela is quite unnavigable. Its volume has great seasonal fluctuations, being easily fordable in many places in winter, and often quite impassable during summer rains. The Tugela receives as tributaries on its right bank the Little Tugela, rising near Cathkin Peak, and the Bushman and Mooi rivers, which both originate near Giant's castle. On its left bank it receives the Klip river, which flows past Ladysmith, the Sunday's river from the Biggarsberg, and the Buffalo river, which rises near Majuba and flows not far from Isandhlwana, at which place, and also at Rorke's Drift, on the Buffalo, memorable actions were fought in the Zulu War. The boundary between Natal proper and Zululand follows the Tugela from its mouth to the confluence with the Buffalo river, and then runs up the latter to its junction with the Blood river, so called on account of the defeat of Dingaan's impi by the Boers in 1838.

TUGGURT, capital of the region of the Wadi Ghir, Algerian Sahara, 127 m. S. of Biskra, with which it is connected by a railway. It is the chief town of a "mixed" commune and of a territory of 212,783 inhabitants. Tuggurt, which has a population of 12,108, was formerly surrounded by a moat, which the French

filled up. The town is entered by two gates. Just within the northern gate is the market place, which contains the chief mosque. The surrounding oasis contains about 200,000 date palms. From Tuggurt a road 75 m. long leads across the desert north-east to El Wad (*q.v.*).

TUGUEGARAO, a municipality (with administration centre and 10 *barrios* or districts) and capital of the province of Cagayan, Luzon, Philippine Islands, on the Cagayan river, about 60 m. from its mouth, and near the southern boundary of the province. Pop. (1918), 19,298, of whom 75 were whites. The river is navigable to Tuguegarao for vessels of light draught. The Cagayan valley is the great tobacco-producing region of the Philippines, and Tuguegarao is an important shipping point for tobacco. Ibanag is the principal language but Ilocano and Tagalog are also spoken by many.

TUKE, the name of an English family, several generations of which were celebrated for their efforts in the cause of philanthropy.

William Tuke (1732–1822) was born at York on March 24, 1732. His name is connected with the humane treatment of the insane, for whose care he projected in 1792 the Retreat at York, under the management of the Society of Friends, which became famous as an institution in which a bold attempt was made to manage lunatics without the excessive restraints then regarded as essential. His son Henry Tuke (1755–1814) co-operated with his father in his reforms.

Henry's son Samuel Tuke (1784–1857) continued the work begun by his grandfather, and published a *Description of the Retreat near York,* etc. (York, 1813). He also published *Practical Hints on the Construction and Economy of Pauper Lunatic Asylums* (1815). He died at York on Oct. 14, 1857.

Samuel's son James Hack Tuke (1819–1896) is chiefly remembered for his philanthropic work in Ireland, which resulted from a visit to Connaught in 1847, where he witnessed much distress. Letters descriptive of the state of things he saw when he was distributing relief in 1880, were published in *The Times,* and in his pamphlet, *Irish Distress and its Remedies* (1880), he pointed out that Irish distress was due to economic rather than political difficulties, and advocated state-aided land purchase, peasant proprietorship, light railways, government help for the fishing and local industries, and family emigration for the poorest peasants. From 1882 to 1884 he superintended the emigration of poor families to the United States and the Colonies. To his reports on the distribution of seed potatoes in 1885, and his letters to *The Times,* which were reprinted under the title *The Condition of Donegal* (1889), were due in a great measure the bill passed for the construction of light railways in 1889 and the Irish Land Act which established the Congested Districts Board in 1891. He died on Jan. 13, 1896.

See *Report of the Select Committee of the House of Commons* (1815–16); Dr. Conolly, *Treatment of the Insane without Mechanical Restraints* (1856); Dr. Hack Tuke, *Chapters in the History of the Insane in the British Isles* (1882).

Daniel Hack Tuke (1827–1895), younger brother of James Hack Tuke, abandoned a solicitor's career to undertake work at the York Retreat. After studying medicine in London, he graduated M.D. at Heidelberg in 1853. In 1858, in collaboration with J. C. Bucknill, he published a *Manual of Psychological Medicine,* which was for many years regarded as a standard work on lunacy. In 1853 he visited a number of foreign asylums, and later returning to York he became visiting physician to the York Retreat and the York Dispensary. In 1859 he retired, but he resumed practice in London in 1875 as a specialist in mental diseases. In 1880 he became joint editor of the *Journal of Mental Science.* He died on March 5, 1895.

Among his works were *Illustrations of the Influence of the Mind on the Body* (1872); *Insanity in Ancient and Modern Life* (1878); *History of the Insane in the British Isles* (1882); *Sleepwalking and Hypnotism* (1884); *Past and Present Provision for the Insane Poor in Yorkshire* (1889); *Dictionary of Psychological Medicine* (1892).

TUKHACHEVSKY, MIKHAIL NICOLAEVICH (1893–), Russian soldier, was born in the government of Smolensk. He was educated in the corps of cadets and the Alexandrovsky military school, out of which he passed in July 1 In Feb. 1915 he was taken prisoner by the Germans, and, after eral fruitless attempts to escape, he succeeded in the autum 1917 and made his way back to Russia. He was at once taken the military service of the Soviet, took part in the operat in defence of Petrograd (Leningrad), and in June 1918 rece the command of an army. He commanded successively th VIII. and V. Armies and then the Caucasian front. After successful conclusion of operations against Denikin, Tukhac sky was given the command of the Western front. After Civil War he became chief of the military academy, and in A 1924 was appointed assistant chief-of-staff.

TUKULOR, a tall, long-headed, well-proportioned and r cular people with long faces and fine features, incorporating Se Wolof, Mandinga, Soninke and Fulani elements in Senegal the French Sudan. They call themselves *Futankobe* or *Futa* the Wolofs call them *Tokoror* or dwellers in the Tekrur (or S galese Futa, or Tukolor, the name adopted for them by French. Their language resembles Fulani and is related to W and Serer. The Tukulor organized a theocratic elective monar with a religious chief (*Almamy*), a functionary whose office abolished in 1881. Their present organization is by territ groups. The Tukulor are fanatical Muslims. The people skilled cultivators and cattle-raisers, and are very brave.

See Dr. Lasnet, *Une mission au Sénégal* (1900); Delafosse, *Sénégal Niger* (1912).

TULA, (1) a province of the Russian S.F.S.R., surrounde those of Kaluga, Moscow, Ryazan, Tambov and Orel, and coinciding with the pre-1917 province of the same name. 24,574 sq.km. Pop. (1926) 1,499,428, mainly Great Russi It consists of plateau land (950 to 1,020 ft.), deeply entrenc by the Don and its tributaries, the Upa and Sosna. About is forested, the northern region having coniferous trees, and south small and scattered patches of birch, ash and oak. south is in the steppe black earth region, where agriculture g a good guarantee to the peasant, but the north is poorer forest soil. There is little good pasture and dairying is much developed, though sheep, working and milch cattle, hor pigs and goats are bred to some extent. The climate is extre with five months' winter frost, an average July temperature 66° F and 16–18 in. of rain per annum.

The chief crops are rye (48·2%), and oats (28·3%). Bu wheat, potatoes, wheat, millet, grass, hemp and sugar beet grown, while along the Oka in the north-west of the provi apples, cucumbers, cabbages and onions are cultivated. working is not profitable and the electric stations at Aleksin Epifan use the local coal. This is mined along the railway tending eastwards from Aleksin on the Oka through Tula the province of Ryazan. The better agricultural conditions les the rôle of koustar (peasant) industries, which here con mainly of the manufacture of small metal goods, especi samovars and wooden wares.

(2) Tula is also the name of the chief town of the ab province, situated in the broad but low, marshy and unheal valley of the Upa, in 54° 12′ N. 37° 37′ E. Pop. (19 150,132. Tsar Boris Godunov founded the first Russian factory here in 1595, and in 1632 a Dutchman, Winius, est lished an iron factory. The factories were rebuilt on a lar scale in 1705 and 1714 and towards the end of the 18th c tury a marked expansion of the industry took place. The mak of rifles is still the main occupation of the town, other ind tries being the manufacture of samovars (tea urns), sugar fining, smelting, the making of cutlery, leather and sewn go and flour-milling. The town is first mentioned in 1147, but former site seems to have been higher up the Tulitsa, an affl of the Upa. Its wooden fort was replaced in 1514–21 by a st *kreml* or citadel, which still exists.

TULAREMIA, a specific infectious disease caused by *Bacterium tularense.* It occurs in rabbits and squirrels throu out the West and South of the United States and causes consid able loss of life among them. In many ways it is quite simi to a plague. The first authentic human case was reported in 1

h. Since then it has become increasingly important owing more general recognition and also to its undoubted increase quency. It is transmitted to man either by an intermediate s the louse or flea or by direct handling of infected animals. ally begins as a small swollen, ulcerated spot on the skin is followed by enlargement of the neighbouring glands. s soon followed by a chill and a high fever which has a ten- to remit daily. There is sometimes a generalized skin rash eneral involvement of the glandular system. Occasionally is a dull typhoid state. The average course is about two The death rate is rather low but numerous fatalities have eported. The disease is of particular importance because rapid spread to new territories indicating that it will prob- ccur more frequently in the future.

LCEA, the capital of the department of Tulcea, Rumania, esquely situated on the right bank of the Danube, 42 m. its mouth at Sulina. Pop. (1928) 28,000, including many ns, Turks, Greeks and Jews. A railway to Cerna Voda is ted. There is a large water-borne trade in cereals.

LIP, a genus (*Tulipa*) of bulbous herbs belonging to the mily (Liliaceae). The species are found wild along the rn shores of the Mediterranean, in the Levant, Armenia, sus, Northern Africa, Persia, and sporadically across North entral Asia to Japan. The cup-shaped flowers have six regu- gments in two rows, as many free stamens, and a three- ovary with a sessile stigma, which ripens into a leathery seeded capsule. The species are numerous, and are dis- hed one from another by the scales of the bulb being or smooth on the inner surface, by the character of the -stalks, by the filaments being hairy or otherwise, and by characters. Owing to the great beauty of the flowers they been favourites in European gardens for two or three cen- and have been crossed and recrossed till it has become impossible to refer the plants to their original types.

early flowering "Van Thol" tulips, the segments of which ostly scarlet with yellow edges, are derived from *T. suave-* a native of the Caspian region. *T. Gesneriana,* a native of ia and central Russia, is the origin of some of the later ing varieties. *T. pubescens,* which is probably a hybrid be- the two species just named, is the source of some of the lowering kinds known as Pottebakker, etc. *T. oculus-solis* *Clusiana* are lovely species, natives of southern Europe, *silvestris,* with elegant yellow flowers, is a doubtful native gland. More recently, owing to the exertions of Russian lists, a large number of new species have been discovered in stan, and introduced into Europe. Some of these are very ful, and render it probable that by intercrossing with the species still further difficulties will be presented in the way ntification. These difficulties are further enhanced by the hat, quite apart from any cross-breeding, the plants, when ted to cultivation, vary so greatly in the course of two or years from the original species from which they are directly ded that their parentage is scarcely recognizable. This in- ower of variation has enabled the florist to obtain, and ulti- to "fix," so many remarkable varieties. At the present day of all kinds are much more extensively grown than at revious period. Not only are millions of bulbs cultivated in nd for export every year, but thousands are now also for the same purpose in the Channel islands, more par- ly in Guernsey. Large quantities are also grown in the strict of England and about Belfast in Ireland. Tulips were uced into the Low Countries in the 16th century from antinople and the Levant.

florists' varieties of tulips, which have sprung from *Tulipa riana,* are arranged in separate classes named bizarres, emens and roses, according to their colour and marking. are readily raised from seeds, and the seedlings when they ower (after about 7 years cultivation) are of one colour— , they are self-coloured. Judged by the florists' rules, they ther good or bad in form, and pure or stained (white or yel- at the base; the badly formed and stained flowers are thrown while the good and pure are grown on, these being known as "breeder" tulips. The breeder bulbs and their offsets may grow on for years producing only self-coloured flowers, but after a time, which is varied and indefinite, some of the progeny "break," that is, produce flowers with the variegation which is so much prized. The flower is then said to be "rectified"; it is a *bizarre* when it has a yellow ground marked with purple or red, a *bybloemen* when it has a white ground marked with violet or purple, or a *rose* when it has a white ground marked with rose colour.

Tulips flourish in any good garden soil that has been deeply dug or trenched and manured the previous season. To secure perfect drainage and greater warmth a fair quantity of sand or grit should be present. Fresh manure should be avoided, but the remains from an old hot-bed or mushroom bed may be incorporated. The best time to plant is in September and October, the bulbs being buried about 6 in. deep and the same distance apart. The best effects are produced in formal beds by planting the same variety in each, to secure the plants being of the same height and in flower simultaneously.

Propagation.—Tulips are usually increased by offsets, which most varieties produce in fairly large numbers. These are taken off and sown in drills, like seed. They are usually strong enough to flower the third year from this sowing. Some varieties produce offsets sparingly and must be increased by seed—a slow and uncertain method. New varieties are raised from seed. (The colour variation in the flowers of seedlings is discussed above.) Seeds are sown in boxes or cold frames, in light sandy soil, and the young plants are allowed to remain undisturbed until the second year. They are then lifted and treated like offsets, being sown thinly in beds out of doors. They usually flower in about the seventh year. The soil in which tulips are propagated should be sandy, free working and thoroughly drained. A warm sheltered position is a necessity.

Cultivation.—Planting is best effected during September, October and early November. It is usual thoroughly to dig and manure the ground in preparation. Holes 6 to 8 in. apart and 5 in. deep are then made with a dibbler. Sometimes a little loose earth or sand is put in to the depth of about 1 in., and the bulbs laid singly thereon, the holes being closed by the dibbler and the whole raked over. Valuable varieties are planted at about the same depth, with a trowel, a little sand being placed around them.

The early flowering varieties should be potted as early in September as practicable, later batches for succession being potted during October. Pots 5 and 6 in. in diameter are the most convenient for the early-flowering kinds, but seven-inch pots give the better results for the "Darwin" section of the May-flowering kinds which are now used for gentle forcing. Five or six bulbs are put in each pot and the tops should be covered with half an inch of soil and half an inch left for water. The soil should be a light and fairly rich compost, comprising about 2 parts loam, 1 part decayed manure or horse droppings that have been thoroughly sweetened, 1 part leaf mould and half a part of sand. Pot firmly, and plunge the pots in several inches of ashes out of doors, to protect the bulbs from frost. As soon as growth commences at the top and a fair amount of roots are formed they may be introduced into gentle heat, in batches according to the need and amount of stock available. For market a slightly different method is adopted. The bulbs are placed in long shallow boxes, plunged in soil or ashes in semi-darkness, and are afterwards transferred to benches in the forcing houses where they flower. Bulbs which have been forced are of no further value for that particular purpose. If planted in borders and shrubberies, however, they will continue to bear fairly good blossoms in the open air for several seasons.

Varieties.—*Early Single* (or *Double*) *Flowering Kinds* are the most useful for bedding and pot culture.

Late Single Flowering Kinds.—These are all tall-growing hardy kinds suitable for growing in herbaceous borders where they can be left undisturbed; or for producing massed colour effects in flower beds. They include (a) "Cottage" or May-flowering tulips, so named because they were discovered in the gardens of old cottages, mansions, abbeys and monasteries, throughout England, Scotland, Ireland, Belgium and France; (b) "Darwin" tulips

which are a distinct race, having a wide range of large self-coloured flowers, but no yellows.

Parrot Tulips.—This late flowering group is supposed to be derived from the curious green and yellow striped *T. viridiflora.* The flowers are mostly heavy and drooping, petals brightly coloured, the edges being curiously notched and wavy.

TULIP-TREE (*Liriodendron Tulipifera*), a North American forest tree closely allied to the magnolia (*q.v.*), called also yellow poplar and whitewood, native from Rhode Island and Vermont west to Michigan and south to Florida and Louisiana. It is one of the handsomest trees of eastern North America, with a straight trunk sometimes 190 ft. high and 10 ft. in diameter, deeply furrowed bark, and large smooth leaves, truncate or broadly notched at the apex and two- to four-lobed at the base. The conspicuous tulip-like flowers, about 2 in. deep, yellowish-green on the outside and orange-coloured within, are followed by a dry cone-shaped fruit, from which at maturity the numerous seeds hang suspended on short slender stalks. From Virginia to the lower Ohio valley and southward, where the tulip-tree attains its maximum size and abundance, it is a valuable timber tree, furnishing the light, fine-grained lumber known as yellow poplar, whitewood or tulipwood. In 1925 the total cut of yellow poplar lumber in the United States amounted to 375,662,000 bd.ft., valued at the mill at $16,318,857. The largest and oldest tulip-tree in the eastern States is at Annapolis, Md.

The tulip-tree is widely planted for ornament, and, with protection when young, thrives in England, sometimes attaining a height of 80 ft.

TULL, JETHRO (1674–1741), English agricultural writer and farmer, was born at Basildon, Berkshire, in 1674, probably in March. He entered St. John's college, Oxford, in 1691, and was called to the bar at Gray's Inn in 1699 but never practised. In that year he married and began farming on his father's land at Howberry, near Wallingford, and here about 1701 he invented and perfected his machine drill, and began experiments in his new system of sowing in drills or rows sufficiently wide apart to allow for tillage by plough and hoe during almost the whole period of growth. In 1709 he moved to a farm near Hungerford and from 1711 to 1714 travelled in France and Italy, making careful observations of the methods of agriculture in those countries which aided and confirmed his theories as to the true use of manure and the importance of "pulverizing" the soil. He did not publish any account of his agricultural experiments or theories until 1731, when his *Horse-hoeing Husbandry* appeared. This was followed by *Horse-hoeing Husbandry, or an Essay on the Principles of Tillage and Vegetation,* by J. T., in 1733. He was attacked in the agricultural periodical *The Practical Husbandman and Farmer* and accused of plagiarizing from earlier writers. He died on Feb. 21, 1741.

TULLAMORE, a market town and the county town of Co. Offaly, Ireland, on the Grand Canal and a branch of the Great Southern railway, by which it is 58 m. west by south of Dublin. Pop. (1926) 4,924. There is considerable trade in agricultural produce, and brewing and distilling are carried on. There are several small ruined castles in the neighbourhood, notably Shragh Castle, dating from 1588.

TULLE, a town of central France, capital of the department of Corrèze, 58 m. S.S.E. of Limoges by rail. Pop. (1926) 10,520. Tulle (*Tutela*) owed its importance in the middle ages to the abbey of St. Martin, founded in the 7th or 8th century. The abbacy was raised to the rank of bishopric in 1317. The town was taken by the English in 1346. It was again conquered by the English in 1369; but, when the inhabitants succeeded in freeing themselves, they were exempted from all imposts by Charles V. The Protestants seized Tulle in 1585. The town extends along the narrow valley of the Corrèze, its streets here and there ascending the hill-slopes on either side by means of stairways. Of its 12th century cathedral, once attached to an abbey, only the porch, nave and a tower of the 13th century, with a fine stone steeple of the 14th century, remain. The neighbouring cloister (12th and 13th centuries) has been restored. The abbot's house (15th century) has a carved doorway and well-preserved windows. Tulle is the seat of a bishop, of a prefect, of tribunals of first instance of a chamber of commerce and a board of trade-arbitrators. principal industry is the manufacture of small-arms, establis in 1690, and now carried on by the state. There are other m industries. The well-known cascades of Gimel formed by Montane are near Tulle.

TULLOCH, JOHN (1823–1886), Scottish theologian, born at Bridge of Earn, Perthshire, in 1823, and received university education at St. Andrews and Edinburgh. In 184 became minister of St. Paul's, Dundee, and in 1849 of Kettin Strathmore, where he remained for six years. In 1854 he appointed principal of St. Mary's College, St. Andrews. appointment was immediately followed by the appearance his Burnet prize essay on *Theism* (1855). At St. Andrews, wh he held also the post of professor of systematic theology apologetics, he lectured on comparative religion and tre doctrine historically, as being not a fixed product but a gro In 1862 he was appointed one of the clerks of the General sembly, and from that time forward he took a leading par the councils of the Church of Scotland. In 1878 he was ch moderator of the Assembly. He did much to widen the nati Church of Scotland. He was deeply interested in the reorgan tion of education in Scotland, both in school and university, acted as one of the temporary board which settled the prim school system under the Education Act of 1872. He died at quay on Feb. 13, 1886.

Tulloch's most important works include: *Leaders of the Reforma* (1859); *English Protestants and their Leaders* (1861); *Rati Theology and Christian Theology in the Seventeenth Century* (18 a monograph on *Pascal* (1876); *Modern Theories in Philosophy Religion* (1884); *Movements of Religious Thought in Britain du the Nineteenth Century* (1885). *See* the *Life* by Mrs. Oliphant (18

TULLUS HOSTILIUS, third legendary king of Rome (6 640 B.C.). His successful wars with Alba, Fidenae and Veii sha forth the earlier conquests of Latian territory and the first tension of the Roman domain beyond the walls of Rome. It during his reign that the combat between the Horatii and Curi the representatives of Rome and Alba, took place. He is sai have been struck dead by lightning as the punishment of his pr Tullus Hostilius is simply the duplicate of Romulus. Both brought up among shepherds, carry on war against Fidenae Veii, double the number of citizens, organize the army, and dis pear from earth in a storm. As Romulus and Numa represent Ramnes and Tities, so, in order to complete the list of the f traditional elements of the nation, Tullus was made the repres tative of the Luceres, and Ancus the founder of the Plebs. distinctive event of this reign is the destruction of Alba, wh may be regarded as an historical fact. But when and by whom was destroyed is uncertain—probably by the Latins.

See Livy i. 22–31; Dion. Halic. iii. 1–35; Cicero, *de Republica,* ii and ROME: *Ancient History.*

TULSA, a city of Oklahoma, U.S.A., 218 m. (by air) S. W. of Kansas City, on the Arkansas river; county seat of Tu county. It is on Federal highways 64, 66 and 75; and is ser by the Frisco, the Midland Valley, the Missouri-Kansas-Tex the Oklahoma Union, the Sand Springs, the Santa Fe and elec railways. Pop. (1920) 72,075 (84% native white and 12% groes); estimated locally at 165,000 in 1928. It was the sec largest city of the State in 1920, and is frequently called "the capital of the world." The city occupies 17 sq.m., 800 ft. ab sea-level, at the meeting-point of the old boundaries of the Cre the Cherokee and the Osage Nations. The old council tree of Creeks, a large elm, still stands. There has been a commiss form of government since 1908; and a city plan and a regio plan have been adopted. The water supply is brought from reservoir in the Spavinaw Hills (60 m. E) by force of gra alone, though the difference in elevation of source and termi is only 90 ft. Mohawk Reservoir, a 500,000,000-gal. reserve the central feature of a park of 2,000 ac. of timbered land, w lagoons, lakes and watercourses fed by the surplus from reservoir. There are 34 public, two parochial and seve private schools. The University of Tulsa, founded at Musko in 1894 as Henry Kendall College, was moved there in 1907.

ssessed valuation for 1928 was $126,352,220. Tulsa is the rcial and financial capital of a rich agricultural country, and lds producing an average of 400,000 barrels of crude oil a ll but one of the large companies operating in the Mid- nt Field have headquarters here, and the International um Exposition is held here annually. White settlement be- 882, when an extension of the Frisco line was completed to lian trading post. "Tulsey Town," as it was called then, owly, reaching a population of 1,390 in 1900. It was char- a city in 1902. Oil developments began in 1901. By 1910 ulation was 18,182; from 1910 to 1920 it increased four-

LSĪ DĀS (1532–1623), the greatest and most famous of poets, was a Sarwariyā Brahman, born, according to n, in A.D. 1532, during the reign of Humāyūn, most y at Rājāpur in the Bāndā District south of the Jumna. her's name was Ātmā Rām Sukal Dubē; that of his mother to have been Hulasī. A legend relates that, having been nder an unlucky conjunction of the stars, he was aban- in infancy by his parents, and was adopted by a wander- hū or ascetic, with whom he visited many holy places in gth and breadth of India; and the story is in part supported sages in his poems. He studied, apparently after having d his family, at Sūkarkhēt, a place generally identified ōrōn in the Etah district of the United Provinces, but robably the same as Varāhakshētra on the Gogra River, W. of Ajōdhyā (Ayōdhyā). He married in his father's e, and begot a son. His wife's name was Ratnāwalī, er of Dīnabandhu Pāṭhak, and his son's Tārak. The died at an early age, and Tulsī's wife, who was devoted worship of Rāma, left her husband and returned to her s house to occupy herself with religion. Tulsī Dās followed d endeavoured to induce her to return to him, but in vain; roached him (in verses which have been preserved) with f faith in Rāma, and so moved him that he renounced rld, and entered upon an ascetic life, much of which was n wandering as a preacher of the necessity of a loving faith ia. He first made Ajōdhyā (the capital of Rāma and near dern Fyzābād) his headquarters, frequently visiting dis- laces of pilgrimage in different parts of India. During idence at Ajōdhyā the Lord Rāma is said to have appeared in a dream, and to have commanded him to write a *yana* in the language used by the common people. He this work in the year 1574, and had finished the third (*Āranya-kāṇḍ*), when differences with the Vairāgī Vaish- at Ajōdhyā, to whom he had attached himself, led him to e to Benares, where he settled at Asī-ghāṭ. Here he died 3, during the reign of the emperor Jahāngīr, at the great 91.

period of his greatest activity as an author synchronized he latter half of the reign of Akbar (1556–1605), and the ortion of that of Jahāngīr, his dated works being as fol- commencement of the *Rāmāyan*, 1574; *Rām-satsaī*, 1584; *ī-mangal*, 1586; *Rāmāgyā*, 1598; *Kabitta Rāmāyan*, be- 1612 and 1614. A deed of arbitration in his hand, 1612, relating to the settlement of a dispute between the f a land-owner named Ṭōḍar, who possessed some villages nt to Benares, has been preserved, and is reproduced in ile in Dr. Grierson's *Modern Vernacular Literature of stan*, p. 51. Ṭōḍar (who was not, as formerly supposed, 's finance minister, the celebrated Rāja Tōdar Mall) was tached friend, and a beautiful and pathetic poem[1] by on his death is extant. He is said to have been resorted a venerated teacher, by Mahārāja Mān Singh of Jaipur 18), his brother Jagat Singh, and other powerful princes; appears to be certain that his great fame and influence as gious leader, which remain pre-eminent to this day, were stablished during his lifetime.

sī's great poem, popularly called *Tulsī-krit Rāmāyan*, but l by its author *Rām-charit-mānas*, "the Lake of Rāma's " is perhaps better known among Hindūs in upper India *Indian Antiquary*, xxii. 272 (1893).

than the Bible among the rustic population in England. Its verses are everywhere, in this region, popular proverbs. Not only are Tulsī's sayings proverbial: his doctrine actually forms the most powerful religious influence in present-day Hinduism; and, though he founded no school and was never known as a *guru* or master, but professed himself the humble follower of his teacher, Narhari-Dās, from whom as a boy in Sūkar-khēt he heard the tale of Rāma's doings, he is everywhere accepted as an inspired and authoritative guide in religion and conduct of life.

The poem is a rehandling of the great theme of Vālmīkī, but is in no sense a translation of the Sanskrit epic. Besides the *Lake of Rāma's deeds*, Tulsī Dās was the author of five longer and six shorter works, most of them dealing with the theme of Rāma, his doings, and devotion to him. The former are (1) the *Dōhābalī*, consisting of 573 miscellaneous *dōhā* and *sōraṭhā* verses; of this there is a duplicate in the *Rām-satsaī*, an arrangement of seven centuries of verses, the great majority of which occur also in the *Dōhābalī* and in other works of Tulsī; (2) the *Kabitta Rāmāyan* or *Kabittābalī*, which is a history of Rāma in the *kabitta*, *ghanākshari chhappāī* and *sawaiyā* metres; like the *Rām-charit-mānas*, it is divided into seven *kāṇḍs* or cantos, and is devoted to setting forth the majestic side of Rāma's character; (3) the *Gīt-Rāmāyan*, or *Gītābalī*, also in seven kāṇḍs, aiming at the illustration of the tender aspect of the Lord's life; the metres are adapted for singing; (4) the *Krishnāwali* or *Krishna gītābalī*, a collection of 61 songs in honour of Krishna, in the Kanaujī dialect: the authenticity of this is doubtful; and (5) the *Binay Pattrikā*, or "Book of petitions," a series of hymns and prayers of which the first 43 are addressed to the lower gods, forming Rāma's court and attendants, and the remainder, Nos. 44 to 279, to Rāma himself. Of the smaller compositions the most interesting is the Vairāgya Sandīpanī, or "Kindling of continence," a poem describing the nature and greatness of a holy man, and the true peace to which he attains. This work has been translated by Dr. Grierson in the *Indian Antiquary*, xxii. 198–201.

A manuscript of the *Ayōdhyā-kāṇḍ*, said to be in the poet's own hand, exists at Rājāpur in Bānda, his reputed birthplace. One of the *Bāl-kāṇḍ*, dated *Sambat*, 1661 (A.D. 1604) 19 years before the poet's death, and carefully corrected, it is said, by Tulsī Dās himself, is at Ajōdhyā. Another autograph is reported to be preserved at Malihābād in the Lucknow district, but has not, so far as known, been seen by a European. Other ancient MSS. are to be found at Benares, and the materials for a correct text of the *Rāmāyan* are thus available. Good editions have been published by the *Khaḍga Bilās* press at Bānkipur (with a valuable life of the poet by Baijnāth Dās), and by the *Nāgarī Prachārinī Sabhā* at Allahabad (1903). The ordinary bāzār copies of the poem, repeatedly reproduced by lithography, teem with interpolations and variations from the poet's language. An excellent translation of the whole into English was made by the late Mr. F. S. Growse, of the Indian Civil Service (5th edition, Cawnpore, 1891).

The best account of Tulsī Dās and his works is contained in the papers contributed by Dr. Grierson to vol. xxii. of the *Indian Antiquary* (1893). In Mr. Growse's translation of the *Rām-charit-Mānas* will be found the text and translation of the passages in the *Bhaktamālā* of Nābhājī and its commentary, which are the main original authority for the traditions relating to the poet. In the introduction to the edition of the *Rāmāyan* by the *Nāgarī Prachārinī Sabhā* all the known facts of Tulsī's life are brought together and critically discussed. For an exposition of his religious position, and his place in the popular religion of Northern India, *see* Dr. Grierson's paper in the *Journal of the Royal Asiatic Society*, July 1903, pp. 447–466.

TULU LANGUAGE, otherwise TULUVA, a language of the Dravidian family, found chiefly in the south Kanara district of Madras. It has no literature, nor has it been adopted for official use even where it is spoken by the majority of the population. It is regarded as one of the most highly developed languages of the Dravidian family and must be classed as lying between Tamil and Kanarese, nearer to the latter than to the former. *See* Bishop Caldwell, *Comparative Grammar of the Dravidian Languages* (1875); *Linguistic Survey of India*, vol. iv. (1906).

TUMBEZ, a littoral province of Peru, located on the Pacific coast in the extreme north-west corner of the country, is bounded east by Ecuador and south by the department of Piura, from which it was created in 1901. Pop. 8,602; area 1,591 square miles.

Its capital is the city of Tumbez (pop. 2,000) located on the Tumbez river about 7 m. from its port on the Pacific ocean (Puerto Pizarro), with which it is connected by rail. Though a littoral province, it is administered by a prefect, and enjoys the other privileges belonging to a department. The province was an ancient stronghold of the Incas and when Pizarro landed in 1527, he found Tumbez already a prosperous city. Nearby the Spanish founded their first settlement in Peru. Because of its accessibility, modern development began early, dating from about 1883. The mountainous district behind the city contains oil and several hundred wells have been sunk. Refineries have been built at Tumbez, Zorritos and Talara. Sugar, tobacco, coffee and cocoa are produced in the district, and cobalt, coal, salt and sulphur are found. Local and foreign trade are growing rapidly.

TUMBLE-WEED, a botanical term for a plant which breaks loose when dry, and is blown about, scattering its seeds by the way. They are especially abundant in the prairie regions of the United States and Canada. Examples are: the old-witch grass (*Panicum capillare*), Russian thistle (*Salsola pestiver*), winged pigweed (*Cycloloma atriplicifolium*), bug-seed (*Corispermum hyssopifolium*) and tumbling mustard (*Sisymbrium altissimum*).

TUMBLING MUSTARD (*Sisymbrium altissimum*), a biennial herb of the cress family (Cruciferae, *q.v.*), native to Europe and extensively naturalized in North America, especially in the North-western States and adjacent Canada, where it has become a pestiferous weed. It grows from 2 ft. to 4 ft. high, with erect, freely branching stems; deeply cut leaves; pale yellow, mustard-like flowers, and long, very narrow, divergent seed-pods. (*See* TUMBLE-WEEDS.)

BY COURTESY OF THE IOWA GEOLOGICAL SURVEY

TUMBLING MUSTARD (SISYMBRIUM ALTISSIMUM), A FREELY BRANCHING PLANT WITH YELLOWISH FLOWERS

TUMKUR, a town and district of southern India, in the west of Mysore state. The town (pop., 1921, 14,246), which is a health resort on the Devarayadurga hills, has a station on the Madras and Southern Mahratta railway, 43 m. N.W. from Bangalore. The area of the district is 4,061 sq.m. It consists chiefly of elevated land intersected by river valleys. A range of hills rising to nearly 4,000 feet crosses it from north to south, forming the water-parting between the systems of the Krishna and the Cauvery. The principal streams are the Jayamangala and the Shimsha. The population in 1921 was 773,122. The cultivated products consist chiefly of millets, rice, pulses and oil seeds.

TUMMEL, a river of Perthshire, Scotland. Discharging from Loch Rannoch, it flows eastward to a point near the Falls of Tummel, where it flows south-east until it falls into the Tay, just below Logierait, after a course of 58 m. from its source in Stob Ghabbar (3,565 ft.). Its only considerable affluent is the Garry, 24 m. long, which issues from Loch Garry (2½ m. long, ¼ m. wide). About midway in its course the Tummel expands into Loch Tummel (2¾ m. long, ½ m. wide), between which and the confluence with the Garry occur the Pass and Falls of the Tummel.

TUMOUR, a term applied, from the earliest period of medical literature, to any swelling of which the nature and origin were unknown. Consequently a heterogeneous collection of swellings was described as tumours, including such diverse conditions as an abscess, a tuberculous gland, the enlarged spleen of malaria or a cancer. With the progress of bacteriology and the improved technique of histology it became necessary to separate these various "swellings" into groups: (1) *Inflammatory or Infective Swellings;* (2) *Swellings due to Hypertrophy;* (3) *Cysts;* (4) *Spontaneous Tumours, or New-growths.* By general consent the term "tumour" is now restricted to the last group. However, for the sake of completeness and because clinically it is not always easy to dia the true nature of a swelling, it is necessary to touch brie the distinguishing features of the first three groups.

1. **Inflammatory or Infective Swellings.**—These hav tain characteristics which separate them sharply from classes of swelling. In the first place they are due to the irri action of some micro-organism. Inflammation due to mic action always follows a typical course. First, numbers of wa ing cells derived from the blood, the lymph or the conn tissues collect at the site of irritation, and these, with the ulable serum poured out from the blood vessels produce the painful swelling with which every one is familiar. The mass gradually subside or it may soften in the centre so that an ab results. Thus an inflammatory swelling may be solid or according to circumstances. The common inflammatory bacte staphylococcus and streptococcus—cause suppuration in the jority of cases, but a few organisms such as the different var of streptothrix, Treponema pallida, and the tubercle ba set up an inflammation so chronic that it does not usually e the formation of pus, but rather in the development of a solid mass of very slow growth, that may persist for mont even years.

To the naked eye and to touch these solid inflammatory swe may closely simulate the spontaneous tumours and, often, th have been confused, but a microscopical examination will c the mistake in nearly every case. For the minute structure fective swellings, whatever their situation, is almost iden they consist merely of an irregular collection of inflamm cells; and this of itself is sufficient to mark them off fro group of tumours proper. To this statement there is one e tion, for a form of malignant tumour, known as a sarcoma, bear a very deceptive likeness to an inflammatory swelling.

2. **Swellings due to Hypertrophy.**—A tissue or org said to be hypertrophied when it is increased in size but re approximately normal in structure. The most familiar exam the hypertrophy of the skeletal muscles that follows incr use, or the hypertrophy of the heart muscle which helps to pensate for faulty action of the valves. But neither of constitutes a hypertrophic swelling. For an instance of th must turn to the enlargement of the spleen that occurs in m and certain forms of anaemia, of the thyroid gland in varieties of goitre, and of the lymphatic glands in Hod disease. In each of these conditions there is an increase o parently normal tissue, and from a microscopical examinati the hypertrophied organ it is difficult to say that it is unhe

3. **Cysts.**—A cyst may be defined as a collection of fluid rounded by a wall or capsule. The nature of the fluid varie cording to the site and origin of the cyst; the cyst-wall is us composed of a tough layer of fibrous tissue. Cysts arise b dilatation of a pre-existing space with fluid, the central dege tion and liquefaction of a solid mass, as in some varieties of ca the disintegration of blood clot as in some cysts of the brai natural growth of some parasites, *e.g.*, hydatid cysts. Whe cyst-wall is tensely stretched by the pressure of the fluid wit a cyst may easily be mistaken for a solid tumour.

4. **Spontaneous Tumours (Neoplasm, New Growth).**— following definition of a spontaneous tumour, or tumour pr suggested by Ziegler is perhaps the most satisfactory: "A plasm or tumour is a new formation of tissue, which is atypi structure, serves no useful purpose to the whole economy, an growth of which has no typical termination." In this defi the words "new formation of tissue" exclude the cystic swell the attribute "atypical in structure" excludes hypertrophies; the final clause "the growth of which has no typical termina excludes all inflammatory swellings which progress, how slowly, towards either suppuration or resolution and recovery

These tumours arise by the exaggerated and abnormal proli tion of a single cell, or a group of cells. They increase in size s by the multiplication of their own cells, and the only contrib which the surrounding tissues sometimes make to the proce the formation of a "stroma," or supporting framework of fi tissue; and even that is wanting in many cases. Inasmuch a

ly-formed cells of the tumour resemble the parent cells the ute structure of a tumour, whatever its situation, recalls that he tissue whence it originated. A tumour growing from skin efore imitates in its essential features the cell-structure of nal skin; the resemblance of some uterine tumours to normal ometrium is often so close as to make it a hard task to dis- uish the one from the other; whilst the similarity of bony cartilaginous tumours to true bone and cartilage is evident ll.

his imitation of the parent type by the spontaneous tumours he of their most remarkable characteristics, and provides a ble criterion by which they may be separated from the in- matory swellings, which, as mentioned above, are all built up he same general plan. Consequently it is almost always pos- to determine the origin of a tumour from an examination of istological appearances; and conversely we know that an epi- al tumour will never spring from a connective tissue nor a ective tissue tumour from an epithelium.

he spontaneous tumours are seen in every tissue and organ of body, though in some they are relatively infrequent. Nor hey confined to man, for they have been found throughout ertebrate kingdom. It is often stated that a higher state of zation brings with it a greater susceptibility to tumour forma- As to this, reliable evidence is hard to obtain, and the appar- mmunity of certain native races is, at least in part due to er death and lack of sufficient observations.

is usual to divide the new-growths into two groups: The *Non- gnant, Innocent or Benign,* and the *Malignant or Cancerous.* hese two groups the malignant have attracted most attention study, on account of the danger to life which they involve, n point of numbers they are greatly outweighed by the non- gnant group. Two or more non-malignant tumours, of dif- t varieties, are often found in the same individual; but with ancers this is rare.

on-malignant Tumours.—These are usually rounded in e. In size they vary enormously; a fibroid tumour of the s or a fatty tumour may be as small as a pea or may weigh pounds. Often they cease growing after attaining a certain but there are very many exceptions to this, and it is seldom ble to predict the subsequent course of one of these growths. possess, however, four constant characteristics by which may be distinguished from the malignant variety.

A non-malignant tumour, whatever its size, remains localized e part from which it originates. It is not an "infiltrating" h, *i.e.*, does not eat its way into the surrounding tissues, but r pushes them aside, and so may be called "expansive." More- it is separated from them by a thin but usually well-marked of fibrous tissue known as the "capsule" of the tumour and ed by the surrounding healthy tissues and representing their ion to its presence.

Non-malignant tumours are not of themselves dangerous to ut may be so from secondary conditions to which they give They may, however, cause a great deal of pain and even ; when situated in special positions. Thus, a small tumour ause intense pain by pressing on a nerve, or dropsical swell- f a limb by obstructing a vein, or death from suffocation by ing the larynx.

Non-malignant tumours never reproduce themselves in dis- parts of the body. More than one may be present in the individual, but each arises independently.

A non-malignant growth never recurs after operation. The laries of the growth are so well defined that complete removal ally easy, and the operation is a simple and satisfactory pro- g. Apparent exceptions to this statement as in adenoma of yroid are due to later growth of an adjacent but independent e neoplasm set free by removal of the pressure exerted by rger one.

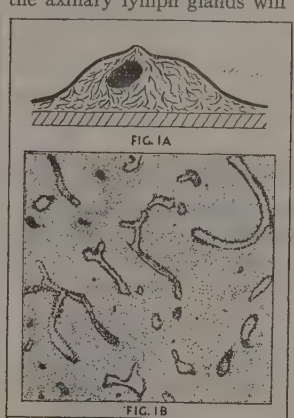
lignant Tumours, or Cancers. (*See* CANCER.)—There are main varieties of malignant tumour: the *Sarcomata,* arising the connective tissues; the *Carcinomata,* arising from epi- l tissues; the *Endotheliomata,* arising from endothelium. It tomary to describe them as cancers. The main features of these tumours are as follows:—

1. *Infiltrating Nature.*—A cancer follows a course very different from that of an innocent tumour. Its growth has no appointed termination, but continues until death; moreover, it is more rapid than that of the innocent tumours, and does not permit of the formation of a capsule by the neighbouring tissues. In consequence such a tumour shows no well-defined boundary, but from its margin fine tendrils of cancer cells, travelling by the lymphatic channels in all directions invade the surrounding parts and induce pressure atrophy of the essential tissue cells in the process. Thus a cancer of the breast will attack both the skin covering it and the underlying muscle and bone; a cancer of the womb will eat its way into the rectum, bladder and even sacrum, until these organs become to a great extent replaced by cancer cells, and can no longer perform their proper functions.

2. *Formation of Secondary Growths.*—In addition to this spread of growth by direct extension, another characteristic of malignant tumours is their tendency to reproduce themselves in parts of the body far removed from the original site. These secondary deposits, or metastases, are due to the tumour cells making their way through the walls of the small lymph and blood vessels and becoming detached in small groups by the force of the circulation, by which they are carried to some distant part of the body, there to continue their career of uncontrolled growth.

The sarcomata and carcinomata differ somewhat as regards the path of dissemination. The sarcomata are tumours with blood-containing spaces between the cells; consequently dissemination usually occurs by way of the blood-stream, and the commonest site for the secondary deposits of sarcoma is the lung. In carcinomata the blood vessels are well formed, and the growth invades the small lymph channels, and the first metastases are in the lymphatic glands; later, these deposits may occur throughout the body, particularly in the liver and other abdominal organs, the lungs and the bones.

The formation of metastases is of the utmost importance from a clinical point of view, as the success of an operation for cancer depends on the removal of all cells of the growth. For instance, a few months after the first appearance of a cancer of the breast the axillary lymph glands will be found to be hard and enlarged. This means that some of the cells of the primary growth have been carried in the lymph stream to these glands, and have multiplied there; consequently any operation for the removal of the cancer of the breast must include the removal of these glands. If the breast tumour only be taken away the growth will continue unchecked in the glands. In many cases where there is no evident enlargement the microscope reveals cancer cells; and a certain opinion can only be given after a microscopical examination.



FROM BARLOW, "PATHOLOGICAL ANATOMY AND HISTOLOGY" (J. & A. CHURCHILL)

FIG. 1A.—DIAGRAM TO SHOW RELATIONS OF AN INNOCENT TUMOUR (ADENOMA) OF THE BREAST
Showing tumour; normal breast tissue, and underlying muscular tissue

FIG. 1B.—SECTION OF TUBULAR FIBRO-ADENOMA OF BREAST X 180

In operations for cancer of the breast or tongue the modern practice is to regard the lymphatic glands of the axilla or neck respectively as infected in every case, however early it be, and to remove them accordingly. In other parts of the body where the glands are inaccessible, the only solution of the difficulty is to urge the removal of the tumour at the earliest possible moment.

The frequency and rapidity of metastasis formation varies greatly. As a general rule cancer of the breast is more liable than other forms of growth to be followed by widespread secondary deposits. On the other hand, in cancer of the skin secondary infection is usually confined to the neighbouring lymphatic glands, and in a large proportion of cases affecting the neck of the womb,

the cancer extends locally but forms no metastases whatever.

3. Nature of Termination.—In one or two well authenticated cases a malignant tumour has disappeared of its own accord without any treatment, and a natural cure may be said to have occurred. But these form such an infinitesimal proportion of the whole that they do not affect the general truth of the statement that the universal and natural tendency of a malignant tumour is to cause death.

Although the separation of new growths into the malignant and non-malignant groups is supported by their respective clinical and histological characters, the difference between them is probably one of degree rather than of kind. It is beyond doubt that occasionally a tumour, which for years has been devoid of malignant characters may suddenly become cancerous. Moreover, certain tumours seem to lie on the border line, for example, rodent ulcers and cancers of the parotid gland. These are malignant in that they are undoubtedly infiltrating tumours, they are innocent in that they never form metastatic deposits. Therefore it seems that malignancy or the reverse is not to be regarded as an absolute and constant attribute of any particular tumour or class of tumours, but rather as an expression of the balance struck in the conflict between the opposing forces of the tumour and its host.

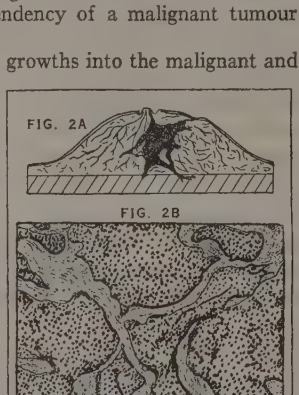


FIG. 2A.—DIAGRAM TO SHOW RELATIONS OF MALIGNANT TUMOUR
FIG. 2B.—SECTION OF SPHEROIDAL-CELL CARCINOMA

Histology of Tumours.—In tumours it is generally true that the essential cells behave approximately in the same fashion as in the corresponding normal tissue. In a duct or tubular gland the lining columnar cells are arranged in a single layer side by side to leave a lumen, and in tumours formed from duct-like structures the same tubular arrangement is recognizable. Similarly, just as in a secreting gland the epithelium multiplies and breaks down into the secretion so in tumours formed from secreting glands the cells multiply and fill the acini (spheroidal cell carcinoma) or in part break down into a representative of the normal secretion (adenoma). So also the characteristic of a connective tissue cell that it forms some substance around it, *e.g.*, fibrous tissue, cartilage or bone, is reproduced more or less faithfully in the connective tissue tumours.

To understand clearly the differences and likenesses that obtain between the malignant and the non-malignant new growths it is necessary to compare the histology of the two groups. These are shown in Figs. 1a, 1b, 2a, 2b, 3 and 4.

In the adenoma the individual gland cells and their mutual relations resemble those of the normal breast from which the adenoma is derived and follow the normal arrangement very closely though the collections of cells are irregularly disposed throughout the stroma. Finally the growth is surrounded by a well defined capsule of fibrous tissue.

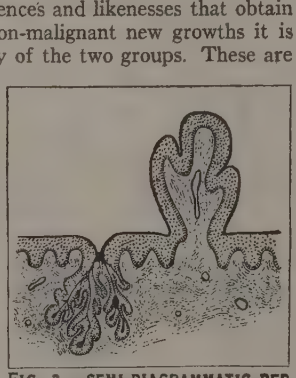

FIG. 3.—SEMI-DIAGRAMMATIC REPRESENTATION OF MALIGNANT AND NON-MALIGNANT TUMOUR

In the carcinoma, the resemblance of cancerous to normal breast cells is slight; their mutual arrangement is disturbed; the collections of cells are arranged in disorderly masses not enclosed by any semblance of a capsule, but transgressing their proper boundaries and invading the underlying muscles. Figs. 3 and 4 show semi-diagrammatically analogous changes in the formation of an innocent and a malignant tumour of the intestinal mucosa and the skin respectively.

Speaking generally it may be said that the cells of an epit non-malignant growth are fully differentiated and typical normal, whereas the cells of a carcinoma show less perfec ferentiation, are in some degree atypical and resemble rath actively growing cells found at an early stage of embryoni But it is in the cells of a sarcoma that the widest departure type is seen. A sarcoma is a malignant growth arising fron nective tissue, but the resemblance to adult connective tis almost non-existent and the cells are essentially of an embr type. These differences between the innocent and the mali cell bear out the well-established physiological rule that th the functional development of a cell or tissue the great power of growth.

In theory it is always possible to distinguish with certain tween an innocent tumour and a cancer by means of the m scope. In practice this is, unfortunately, not the case. The some tumours whose histological appearances are on the b line between the two conditions, and often these are the very in which the clinical features give no direct clue to their n In such circumstances it is only by taking into consideration detail, that an opinion can be formed.

The Causation of Tumours.—Innumerable suggestions the causation of tumours have been put forward from ti time. Here, reference can only be made to the more importa

First in point of time comes *Virchow's hypothesis* that tu arise as the direct result of chronic irritation or injury. A of the lip or tongue may follow the irritation of a clay pip jagged tooth, cancer of the urinary bladder may result fro irritation of Bilharzia ova (*see* BILHARZIASIS), of the gall-b from irritation of a gall-stone, of the skin from prolong posure to X-rays. But, on the other hand, there must numerable instances in which such causes of irritation ha been followed by a tumour. As a complete explanation Vir hypothesis is insufficient, is certain that chronic irri has, at least, an accessory disposing influence in t formation.

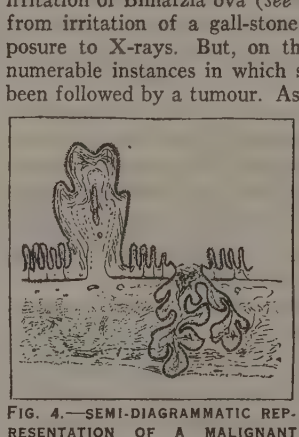

FIG. 4.—SEMI-DIAGRAMMATIC REPRESENTATION OF A MALIGNANT (RIGHT) AND A NON-MALIGNANT (LEFT) TUMOUR INVOLVING INTESTINAL MUCOSA OR ENDOMETRIUM

Another theory is *Cohn hypothesis of embryonic nants*. According to Coh more cells are, at times, pro in embryonic life than a quired for the development body, and a remnant is left propriated. Owing to thei bryonic nature, these cells p an exaggerated power of liferation, and if at a later of life this should be rouse activity by some mechanical or other form of stimulus, the of growth will outstrip that of the adult cells and a tumou develop. This is at best only a partial explanation which m applicable to a small proportion of tumours.

The *Parasitic hypothesis* is still a matter of keen debat CANCER RESEARCH). In some degree cancer with its loc primary growth and widespread secondary deposits resembl tain infective diseases of microbial origin, such as pyaemia, from a small primary site of infection the bacteria becom seminated throughout the body. From this analogy it was that tumour formation was due to the activity of some pa But if the mode of dissemination of a cancer and of a organism be carefully examined this analogy is found to be When a micro-organism lodges in a gland or other part body, by its irritative action it stimulates the cells of that or tissue to increased activity, and any swelling that occ produced by the proliferation of those cells. But when a of cancer-cells is deposited in a gland the subsequent g arises entirely from the multiplication of those cancer-cell the gland cells take no part whatever in its formation.

At the present time the general weight of evidence see

our the idea that tumour formation is ultimately due to some insic cause, whereby the normal processes of growth are dis-ed, rather than to any extrinsic cause such as microbial in-ion. Therefore it is from a careful study of the laws of growth, from research directed along broad biological lines that the results are to be looked for in the future.

lassification of Spontaneous Tumours.—Many classifica-s have been suggested but one on a scientific basis is not yet in reach. That given below is suggested as convenient for the moner varieties but owing to the complexity of new growths n a specimen cannot be placed in a single group and is better sified, for example, as a fibro-myoma, myxo-chondroma, chon-sarcoma, adeno-carcinoma, etc. Rarer neoplasms such as the rnephroma, chloroma, chordoma, seminoma and sympathoma ot considered here.

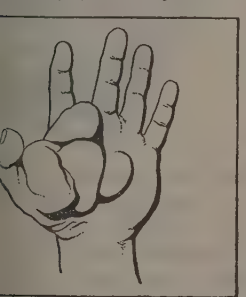
III. ENDOTHELIAL TUMOURS (MESOBLASTIC)

Innocent	*Malignant*
me parotid and similar growths.	Some pleural, peribroneal, and similar growths.

Connective-tissue Tumours[1].—*Lipoma* (fig. 5).—Of the ective-tissue group the fatty tumours are the most common. often arise from the layer of fat beneath the skin on the , though at times they are found on the limbs and elsewhere. are soft, painless swellings, sometimes of great size; though lly single, as many as a dozen may be present in the same individual. Lipomata are also found in the abdominal cavity, growing from the subperitoneal layer of fat.



. 5.—LIPOMA OF THE PALM

Fibroma.—Pure fibromata are rare and chiefly seen in the sheaths of nerves (fig. 10) where they are often multiple, the larynx, the gums forming one variety of so-called *epulis* and the subcutaneous tissue (painful subcutaneous nodule). But almost all tumours contain some admixture of fibrous tissue and of these commonest and most important are the so-called fibroids of terus (*see* under *Myoma*).

yoma.—This tumour is composed of muscle fibres, unstriated ot in one very rare variety *rhabdo-myo-sarcoma.* Pure myo- are rare and sometimes found in the oesophagus, stomach bladder. In the uterus, with more or less admixture of fibrous e, and therefore better termed fibro-myomata, they are very mon. They originate in the wall of the uterus, but generally to project either internally into the cavity of the uterus, or nally into the peritoneal cavity; and often their sole con-on with the uterine wall is a stalk or pedicle formed from the ule of the tumour. Fibromyomata of the uterus occur in ied and unmarried women and are most common from 35 to ars of age; in girls under 20 they are almost unknown. They attain a great size and are often multiple. Not every fibroid is a source of danger or discomfort, for in many cases they are discovered by chance or not until after death. On the other hand they may give rise to severe symptoms, in many different ways (*see* GYNAECOLOGY). A fibroid tends to prevent conception, whilst, should pregnancy occur miscarriage is common, and if carried to term, labour is greatly impeded. Occasionally a fibroid undergoes sarcomatous change.

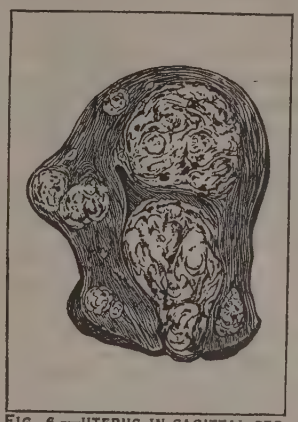


FIG. 6.—UTERUS IN SAGITTAL SECTION SHOWING INTERSTITIAL AND SUBMUCOUS FIBROIDS

Osteoma (fig. 7).—Bony tumours not infrequently arise from the bones of the head or face. They grow very slowly, and are so hard that surgical removal may be very difficult. They also occur as irregular outgrowths from the bones of the limbs, and are then known as *Exostoses* (fig. 8). A common site for these is the inner and lower end of the femur, at the point of attachment of the adductor muscle, and such a tumour seems to originate from an ossification of the tendon of this muscle.

Chondroma (fig. 9).—Cartilaginous tumours occur chiefly in children and young people, growing from the bones of the limbs in the neighbourhood of the joints. They are frequently multiple, especially in the hands and feet, but never affect the terminal phalanges. These tumours grow slowly and are quite painless.

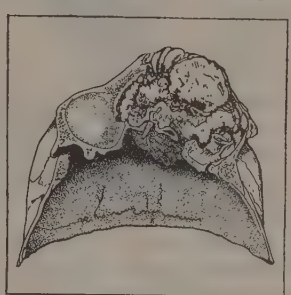

FIG. 7.—OSTEOMA OF THE LEFT FRONTAL SINUS (SEEN FROM BELOW)

Odontoma.—Several varieties of this tumour have been described arising in connection with the teeth and due to delayed or faulty development. They may cause great deformity of the jaw.

Myxoma.—This is composed of loose, gelatinous connective tissue similar to that found in the umbilical cord. Some nasal polypi seem to be of this nature, but true myxomatous tumours are rare. It is, however, not uncommon for a fibroma or a sarcoma to be converted by degeneration into myxomatous-like tissue.

Neuroma.—A pure neuroma is very uncommon, but a tumour known as a *Pseudo-neuroma* is to be often found in the course of a nerve. This is formed by a localized overgrowth of the fibrous tissue of the nerve sheath.

FIG. 8.—EXOSTOSIS OF THE FEMUR PRODUCED BY THE OSSIFICATION OF THE TENDON OF THE ADDUCTOR MAGNUS

Glioma.—This variety of tumour arises from the neuroglia, the supporting tissue of the brain and spinal cord. Consequently gliomata are only found in these two structures, and the retina which is really an extension of the brain.

Angioma.—This consists of a mesh-work of blood vessels bound together by a small amount of fat and fibrous tissue. Two varieties are described: (*a*) The *simple naevus*, or *port-wine stain*, scarcely deserves to be called a tumour. It appears as a reddish-blue discolouration of the skin due to over growth and dilatation of the underlying blood-vessels. This condition is most commonly found in the face or scalp, and may be of congenital origin. (*b*) In the *cavernous naevus* the vascular hypertrophy is on a larger scale, and may produce a definite pulsating tumour. Here, again the head is the usual situation. (For illustrations *see* PATHOLOGY.)

Sarcoma.—This is the malignant type of the connective-tissue

gs. 5, 6, 7, 8, 13, 14 and 16 have been redrawn from Bland Sut-*Tumours*, by permission; figs. 9, 10, 11 and 12 are from Rose & ss, *Surgery*, by permission.

tumour. Hence, fibro-sarcoma, chondro-sarcoma, osteo-sarcoma, glio-sarcoma, etc., are met with. The general arrangement of a sarcoma shows a mass of atypical cells loosely bound together by a small amount of connective tissue. The cells vary greatly in size and shape in different tumours, and in accordance with the prevailing type the following varieties of sarcoma have been described: (i.) *round-cell sarcoma,* (ii.) *spindle-cell sarcoma,* (iii.) *melanotic sarcoma,* (iv.) *myeloid sarcoma.* Nevertheless the melanotic growth is held by many authorities not to be of connective tissue origin and therefore a sarcoma, but epithelial and therefore a carcinoma. To it the non-committal name *melanoma* is often given. Similarly the myeloid variety owing to its peculiar characters is by many excluded from the group of sarcomata and placed in a separate class "myeloma." The round and spindle cell varieties contain the great majority of all sarcomata, and may occur in almost any part of the body, but they are especially liable to attack the bones (fig. 11). A sarcoma of bone may be either *periosteal* when it grows from the periosteum covering the outer surface of the bone, or *endosteal* when it lies in the medullary cavity. A peculiar form of sarcoma, by many classified as an endothelioma, is found in the parotid and other salivary glands. The cells are usually spindle-shaped, and among them lie scattered masses of cartilage and fibrous tissue. These tumours are seldom very malignant, and dissemination is rare (fig. 12). The melanoma consists of cells widely irregular in shape and may be pale yellow or brown or black owing to the presence of few or many granules of pigment (melanin) in and among the tumour cells. A melanotic sarcoma may arise from a pigmented wart or mole, or from the pigmented layers of the retina. The primary growth is usually small, but dissemination occurs with great rapidity throughout the body. Melanomata are intensely malignant, whether the cells contain little or much melanin. The *myeloid sarcoma,* or *myeloma* (fig. 13), is composed of irregularly shaped cells amongst which are large multinucleated cells like the myeloplaxes of bone-marrow (*see* BONES, ANATOMY OF; BONES, DISEASES OF). It is only found in the interior of bones, chiefly in those of the arm and leg. The degree of malignancy is low, dissemination possibly never occurs, and recurrence after operation is rare.

FIG. 11.—PERIOSTEAL SARCOMA OF FEMUR

II. Epithelial Tumours.—*Papilloma.*—The familiar example of a papilloma is the wart, which is formed by a proliferation of a few papillae of the skin together with the overlying squamous epithelial layers (fig. 3). It seems probable that some warts are of an infective nature, for instances of direct contagion are not uncommon and in special regions they occur in the definitely infective diseases gonorrhoea and syphilis. Occasionally warts are pigmented, and as noted above the melanoma is apt to start in such a
Papillomata are also found in the bladder (fig. 14), as long
cate filaments growing from the bladder wall. These consi
a connective-tissue core covered by a thin layer of epitheliu

Adenoma.—(Figs. 1*a* and 1*b*.) The glandular tumours are
mon in the breast, the ovary and the intestinal canal. The s
ture of an adenoma of the breast has already been described
supra), and the structure of other adenomata is on the
general plan, subject to the difference imposed by the tubul
acinous character of the gland concerned (*see* GLAND). The main features of an innocent glandular tumour are: (*a*) the presence of a rounded, painless swelling with a well-defined margin; (*b*) the swelling is freely movable in the surrounding tissues, not attached to skin; (*c*) neighbouring lymphatic glands are not enlarged.

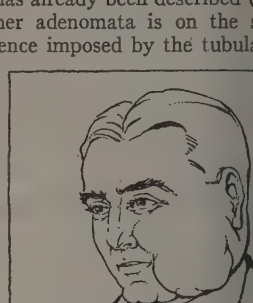

FIG. 12.—MALIGNANT TUMOU
THE PAROTID GLAND

Carcinoma.—The following varieties of carcinoma are described:—

i. Squamous-cell carcinoma (fig. 4), arising from those parts of the body covered by squamous epithelium, namely the lips, tongue, mouth, pharynx, oesophagus, vagina, anus and bla

ii. Spheroidal-cell carcinoma (figs. 2*a* and 2*b*), arising spheroidal epithelium, as in the breast, pylorus, pancreas, and prostate.

iii. Columnar-cell carcinoma (figs. 15 and 16), arising columnar epithelium, as in the intestine, stomach and ducts of the breast.

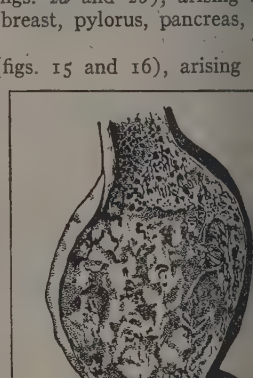

FIG. 13.—LOWER END OF A F
IN LONGITUDINAL SECTION, S
ING A MYELOMA

The general histology of these tumours corresponds to that of a spheroidal-cell carcinoma already described (*vide supra*), variation between the three groups being dependent on the character of the cells. Thus Keratinization is a common feature of squamous cell carcinoma and when colloid degeneration of a carcinoma occurs it is always either a spheroidal or a columnar cell growth. Amongst spheroidal cell carcinomata great variation occurs in the amount of fibrous tissue present; when fibrosis is very great the growth is often termed a "scirrhus." The clinical characteristics of a carcinoma, whatever its situation, are: (*a*) the
ence of a swelling which has no well defined margin, but
away into the surrounding tissues to which it is fixed; (*b*)
the tumour lies in or near the skin it becomes fixed to thi
ulcerates at an early date; (*c*) the tumour is painful and t
though the degree of pain varies widely, and in the early stages there may be none; (*d*) the neighbouring lymphatic glands soon become enlarged and tender, showing that they are the seat of metastatic deposits.

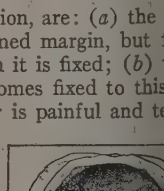

FIG. 14.—VILLOUS
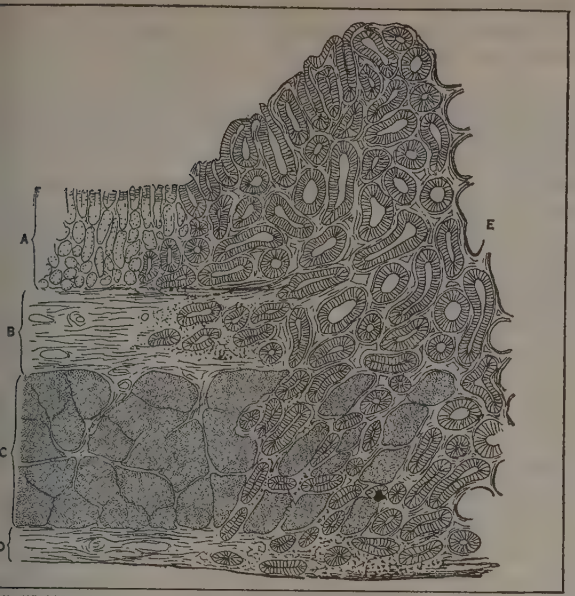
ILLOMA OF THE BL

iv. Rodent cancer or rodent ulcer, often called basal cell carcinoma, is a special variety of squamous cell carcinoma arising from the germinal layer of the skin probably in the close relation to the sebaceous glands. It shows itself as a slowly progressing ulceration of the skin, and is especially common o
face near the eye or ear. The condition is one of purely
malignancy, and dissemination does not occur.

III. Endothelial Tumours.—*Endothelioma* is a variet

wth that is rather inferred on general histological grounds than nded upon indisputable miscroscopic or clinical characters.



M ZIEGLER, "PATHOLOGICAL ANATOMY" (MACMILLAN)

G. 15.—SECTION THROUGH ADVANCING MARGIN OF COLUMNAR CELL NCER OF STOMACH SHOW'NG, (A) MUCOSA, (B) SUB-MUCOSA; (C) ISCULAR COATS; (D) PERITONEUM

ce endothelial cells lie next one another without intervening stance they resemble in this respect epithelial cells but em- logically they are mesodermal and therefore allied to the con- tive tissue group. The features of en- helial tumours therefore might be ex- ed to resemble now the one, now the er group and, indeed, there is some dency to refer to the endotheliomata sual varieties of growth which cannot be placed in recognized groups. Nev- eless a primary subdural growth or of the pleural cavity cannot be glan- r however much it may resemble a car- oma microscopically. Growths involv- proliferation of the endothelium lining d and lymphatic channels (*perithelio- a*) are perhaps the most convincing nples of endothelioma.

UMULUS, an artificial mound of earth or stone, usually cal in shape, erected either as a memorial, or over the grave royal personage, noble or hero, or the relic of a saint. erary tumuli are sometimes known as barrows (*q.v.*).

UNBRIDGE WELLS, a municipal borough and inland ring-place of England, chiefly in the Tonbridge parliamentary ion of Kent, but extending into the eastern division of Sussex, n. S.E. by S. of London by the S. railway. Pop. (1921) 51. It owes its popularity to its chalybeate spring and its tiful situation in a hilly wooded district. The wells are situ- by the Parade (or Pantiles), a walk associated with fashion the time of their discovery. It was paved with pantiles in reign of Queen Anne. Reading and assembly rooms adjoin pump-room. The town is built in a picturesquely irregular ner, and a large part of it consists of districts called "parks" occupied by villas and mansions. On Rusthall Common about a mile from the town is the curiously shaped mass of sandstone known as the Toad Rock, and a mile and a half south-west is the striking group called the High Rocks. The Tunbridge Wells sanatorium is situated in grounds sixty acres in extent. Five miles south-east of Tunbridge Wells is Bayham Abbey, founded in 1200, where ruins of a church, a gateway, and dependent buildings adjoin the modern Tudor mansion. The vicinity of Tunbridge Wells is largely residential. To the north lies the urban district of SOUTHBOROUGH (pop. 7,102). There is a large trade in Tunbridge ware, which includes wood-tables, boxes, toys, etc., made of hard woods, such as beech, sycamore, holly, and cherry, and inlaid with mosaic. Tunbridge Wells was incorporated in 1889.

The town owes its rise to the discovery of the medicinal springs by Dudley, Lord North, in 1606. Henrietta Maria, wife of Charles I., retired to drink the waters at Tunbridge Wells after the birth of her eldest son Charles. Soon after the Restoration it was visited by Charles II. and Catherine of Braganza. It was a favourite residence of the princess Anne previous to her accession to the throne, and from that time became one of the chief resorts of London fashionable society. In this respect it reached its height in the second half of the 18th century, and is specially associated with Colley Cibber, Samuel Johnson, Cumberland the dramatist, David Garrick, Samuel Richardson, Sir Joshua Reynolds, Beau Nash and Mrs. Thrale. The Tunbridge Wells of that period is sketched in Thackeray's *Virginians*.

TUNDRA, the cold, desert, treeless plains which form the Arctic lowlands of Europe and Asia. The name is also generally applied to a similar area in North America. The word is of Russian origin and means a marshy plain. The prevailing low temperatures are consequent on high latitude and proximity to the frozen northern ocean and result in very scanty vegetation.

TUNGABHADRA, a river of southern India, the chief tributary of the Kistna. It is formed by the junction of two streams, the Tunga and the Bhadra, which both rise in Mysore in the Western Ghats. The united river for nearly all its course forms the boundary between Madras and the dominions of the nizam of Hyderabad. On its right bank stood the capital of the ancient Hindu dynasty of Vijayanagar, now a wilderness of ruins.

T'UNG-CHOW, a city in the province of Chih-li, China, on the banks of the Peiho, 12 m. E. of Peking. Its population is estimated at about 50,000.

It is situated at the highest point of navigation of the Peiho, and is the port of Peking. It is an old settlement known to the founder of the Han dynasty (206 B.C.) as Lu-Hien; under the T'ang dynasty (A.D. 618) its name was changed to Hūan-Chow, and at the beginning of the 12th century, with the advent of the Kin dynasty, Hūan-Chow became T'ung-Chow. During the Boxer outbreak in 1900 T'ung-Chow was occupied by the allied armies, and a light railway built connecting the city with Peking.

TUNGKWAN, a Chinese fortress near the junction of Wei-ho and Hwang-ho. The way down the valley is hemmed in by great loess walls, sometimes on one side of the valley, sometimes, as at Tungkwan, on both. The river is rapid and flows, at places, over a rocky bed, so it is unsuited for navigation in this region.

TUNG OIL. Two varieties are known, differing slightly in their physical properties, termed Chinese Tung Oil (China wood oil) and Japanese Tung Oil according to the country of origin. In China the oil is prepared from the seeds of *Aleurites cordata;* these are roasted in flat dishes over a fire, then coarsely powdered and expressed in primitive wooden presses. The kernels which contain up to 53% of oil yield in practice about 40%. The pale yellow oil for exportation, known as "white tung oil" is obtained by expressing the seeds in the cold; the hot-pressed oil—"black tung oil"—is dark brown in colour and possesses a strong, unpleasant odour. Chinese tung oil has the highest specific gravity (0·940 to 0·944) of all known fatty oils, with the exception of castor oil, and the highest refractive index. The characteristic property of Chinese tung oil is the readiness with which it becomes polymerized, setting to a hard jelly on being heated for a short time to a temperature of 250° Centigrade. Polymerization is also induced by dropping saturated solution of iodine on to the

surface of the oil, which immediately solidifies. The pronounced drying properties of tung oil render it suitable for use in the manufacture of paints and varnishes. In China it is further used for water-proofing paper. Tung-oil trees have been successfully introduced in the United States in the north-central part of Florida where more than 1,500 acres are planted. Up to 1929 all available seed was being used for planting. More than 100,000,000 pounds of the oil are imported annually and it is hoped that eventually the domestic supply will meet American needs. (*See* also OILS AND FATS; and M. Toch, *Chemistry and Technology of Paints*, 1926.) (E. L.; G. H. W.)

TUNGSTEN. The name tungsten means "heavy stone" (Sw. *tung*, heavy, *sten*, stone), and directs attention to the high specific gravity of the element and its ores. (Symbol W, atomic number 74, atomic weight 184·0.) Up to the middle of the 18th century the mineral then known as tungsten, but now called scheelite, together with wolfram, were both considered to be ores of tin. In 1781, K. W. Scheele showed that this mineral contained a peculiar acid, which he named tungstic acid, combined with lime as a base, and in the same year Bergmann advanced the opinion that the new acid was a metallic calx. Two years later the Spanish chemists, the brothers d'Elhuyar, proved that this acid was present in wolfram, and by heating the acid with carbon produced metallic tungsten for the first time.

Tungsten occurs in nature in the form of tungstates of iron, manganese and calcium, which may be divided according to their crystalline form into two groups. The iron and manganese tungstates, crystallizing in the monoclinic system, form the wolfram group, whilst calcium tungstate or scheelite belongs to the tetragonal system. Pure iron tungstate ($FeWO_4$) is known as ferberite and pure manganese tungstate ($MnWO_4$) as hübnerite. The mineral wolfram or wolframite is normally a mixture of these two compounds in varying proportions. Wolfram generally occurs in columnar, blade-like or massive forms, though sometimes it is found in well formed prismatic or tabular crystals. It breaks up readily into thin flakes and its specific gravity ranges from 7·2–7·5. The colour may vary from nearly black to a brownish tinge characteristic of specimens rich in manganese. Scheelite or calcium tungstate ($CaWO_4$) may occur in the form of well developed crystals which are usually double tetragonal pyramids, but frequently it is found in a massive form with four good cleavages. The specific gravity is about 6 and the colour variable. It is generally grey, pale-yellow, or pale-brown, rarely green or reddish, with a waxy lustre. The world's principal supplies of tungsten ores have come from China, Burma, Japan, Australia, Bolivia and the United States.

Extraction and Manufacture.—The tungsten content of the ore as mined is usually 0·5 to 2·0%, so that a concentration process is necessary for extraction. The wolfram in the ore is associated with quartz and other gangue material, but it can be readily separated from these impurities owing to its high density. To remove cassiterite (SnO_2) which is present in a large proportion of wolframite ores, magnetic methods are employed. Wolfram, containing iron, is fairly magnetic, whilst cassiterite is not attracted as a rule even by powerful magnets. With scheelite, fortunately, the association of cassiterite is not common, otherwise (since scheelite is non-magnetic) chemical processes would have to be employed to effect the separation.

Many methods are available for the extraction of tungsten from its ores but the general principles involved in the extraction from wolfram may be illustrated by a brief summary of the sodium carbonate fusion process. The concentrate, after removal of cassiterite and other deleterious impurities, is mixed with excess of sodium carbonate and heated in a reverberatory furnace to about 1,000° C in an oxidizing atmosphere. Thereby sodium tungstate is produced, and the iron and manganese present are converted to oxides:

$$4FeWO_4+O_2+4Na_2CO_3 = 4Na_2WO_4+2Fe_2O_3+4CO_2$$
$$6MnWO_4+O_2+6Na_2CO_3 = 6Na_2WO_4+2Mn_3O_4+6CO_2.$$

The soluble sodium tungstate is extracted with boiling water and on treatment with boiling hydrochloric acid an amorphous yellow precipitate of tungstic acid (H_2WO_4) is obtained which y WO_3 on calcination. In the preparation from scheelite the f ground ore is decomposed with hydrochloric acid, whereby cium chloride passes into solution, and tungstic acid, tog with insoluble impurities like silica, remains as a sludge:

$$CaWO_4+2HCl = CaCl_2+H_2WO_4.$$

To purify the tungstic acid produced in these processes, it be dissolved in ammonia and crystallized out as ammonium tungstate, $5(NH_4)_2O,12WO_3,xH_2O$. This is decomposed by drochloric acid to yield purified tungstic acid, or ignited in a tungstic oxide (WO_3).

Freedom from impurities and a suitable physical condition absolutely necessary if tungsten is to be used for incandes lamps or for wireless work. In this case, the method univer adopted for the preparation of the metal is reduction of oxide by hydrogen, whereby the tungsten is obtained as a pov For alloying purposes, however, where greater latitude is all in the amount of impurity and where the physical condition o metal is of minor importance, the oxide is reduced by carbon the resulting powder used for tungsten steels and other alloys.

The high melting point of tungsten precludes its indus manufacture in the cast state from the powdered metal, and if this were possible the product would be of little value would be both brittle and difficult to work mechanically. I the researches of Coolidge, who took out his first patent in a process has been developed which is capable of producin fine tungsten wire that can be manipulated with little more culty than any other fine wire. In this process the powd compressed in a hydraulic press into bars which are then he to a high temperature in a furnace in an atmosphere of hydro whereby a strong but brittle product results. This is now verted into rods by a mechanical hammering process in which metal, previously heated to 1,500° C in an electric furnace hydrogen atmosphere, is subjected to 10,000 blows per minu a special swaging machine. Further reduction of the diamete the wire—usually from 1mm.—is effected by drawing thr dies. Tungsten wire can be drawn to 0·011mm. diameter, w by immersion for 45 seconds in a fused mixture of sodium ni and nitrite at 340° C a wire of diameter 0·014mm. is unifo reduced to 0·007mm.

Physical and Chemical Properties.—Tungsten in the of wire or sheet is dull white. The physical properties alter changes in the structure of the metal, so that values for den tensile strength, specific electrical resistance, etc., vary with stage of swaging or drawing. The theoretical value for the de of pure tungsten, calculated from the atomic spacings, is The probable melting point is 3,382° C, although the 3,267°±30° C is also quoted. Tungsten has the highest me point of the metals. X-Ray analysis shows that tungsten body-centred cubic lattice, the length of the cube edge 3·155±0·001 Å. For further physical data, *see* C. J. Smith *Tungsten* (1926). Tungsten undergoes no appreciable oxida on heating in air below red heat nor does it react with nitro except when in the state of vapour. It is very resistant to action of acids, neither *aqua regia* nor hydrofluoric acid attac it to any appreciable extent. The best solvent for the fused m is a mixture of concentrated nitric and hydrofluoric acids. A ous alkalis are without action but fused alkalis dissolve the m

Tungsten in its compounds exhibits valencies of 3, 4, 5 an whilst, in addition, compounds of the empirical formula (where R=Cl, Br, or I) are known. In the case of chloride, ever, the molecular formula is W_3Cl_6. The trioxide WO_3 bright canary-yellow powder which becomes dark orange heated and fuses between 1,300°–1,400° C. It is insolubl most acids including *aqua regia* but hydrofluoric acid dissolve With aqueous alkali hydroxides or carbonates it forms tungst containing varying proportions of WO_3 to metallic oxide. A h chloride and hexafluoride are known. The compounds $[WO_2$ $K_2[WOCl_5]$, $K_4[W(CN)_8]$ exhibit tungsten with co-ordina numbers of 4, 6 and 8.

Applications.—Tungsten finds wide application as a filan

lectric lamps, and as it has a hardening effect on other metals h which it is alloyed it is a constituent of some of the most portant industrial alloys. Tungsten steels are employed in the nufacture of cutting tools and permanent magnets. The stellite ys containing cobalt, chromium and tungsten are extremely d and are used for cutting tools and surgical instruments, as y are not affected by organic acids and ordinary antiseptics. er uses of the metal include X-ray targets, thermionic devices, anometer suspensions, electrical contacts, refractory crucibles,

(W. Wa.)

TUNGSTEN STEEL. The earliest alloy of this type is shet steel (*q.v.*). It contains from 5·5 to 9·0% of tungsten also carries enough manganese to give it air-hardening perties and to class it as a quaternary alloy. This article siders principally commercial ternary alloys of tungsten. High on steels containing tungsten up to 6% are essentially water-dening steels. (*See* Iron and Steel Heat Treatment; TALLOGRAPHY.) The atoms of tungsten, being so much larger heavier than those of iron, diffuse comparatively slowly in l metal, so that a high temperature is required for solution ore the quench. Accumulation of carbide particles upon pering is also slow, hence the ability of tungsten steels to l their hardness at high temperatures. Tungsten carbide also a very high intrinsic hardness, approaching that of the mond. For keen edged tools tungsten in the alloy seems to ent small particles from being torn away during use, and retards dulling.

teel containing 0·9% carbon or more together with 1 to 2% gsten is used for hack saw blades and for reamers, broaches other tools which must show a minimum change in dimension r heat treatment. Steels with 1% carbon or more, and 3 to tungsten, are much used for "fast-finishing" tools to cut metals or to make a fine smooth cut on softer tough metal. for cold drawing wire and other shapes are made of higher on steels (2%) with tungsten ranging from 1 to 12%. Dies the higher tungsten percentages are used for the harder ls or the finer wires.

hromium is often added to facilitate the diffusion of tungsten. n 0·5% or more is present the alloy may crack during water ening. An oil quench, however, will harden it through to the re. Chromium also causes the useful hardness to be retained igher working temperatures. For working hot metal, tools ld be made of 0·3% carbon steel with 10% tungsten and chromium (known as "semi-high-speed"). Permanent mag- for electric meters, magnetos, radio and telephone equipment rb annually several thousand tons of steel containing 0·7% on and 5 to 6% tungsten.

tungsten-iron alloys, substantially free from carbon, tungsten the property of lowering the temperature at which delta iron ges to gamma iron and also of raising the temperature at h gamma changes to alpha iron. Consequently the American llurgist W. P. Sykes was able to show that no gamma iron rmed in carbon-free alloys containing more than 7% tungsten. an alloy is permanently austenitic, and cannot be hardened empered by heat treatment. In the alloys containing more sten the compound Fe_3W_2 appears; its solubility decreases the temperature, and it is precipitated throughout the metal slow rate. To harden such an alloy it is necessary to anneal age" it at a moderate temperature for several hours or days. ell hardness numbers indicate the extent of this action:

	Brinell
rbon free iron	70
rbon free solid solution alloy, 80% iron, 20% tungsten	160
ove after aging	330
rbon free aged alloy, 78% iron, 22% molybdenum	530

aged alloys of iron and tungsten and of iron and molybdenum gsten and molybdenum being very similar chemically) form lent wire drawing dies, and have given 10 to 40 times the ce that can be had from best high speed steel before the needs re-dressing. (*See* Iron and Steel; High Speed L.)

(E. E. T.)

UNGUSES, a widespread north Asiatic people. They are the *Tung-hu* of the Chinese, probably a corrupt form of *tonki* or *donki*, that is, "men" or "people." The Russian form *Tungus*, wrongly supposed to mean "lake people," appears to occur first in the Dutch writer Massa (1612); but the race has been known to the Russians ever since they reached the Yenisei. The Tungus domain stretches from long. 60° E. to the Pacific ocean and from the Arctic to the Chinese frontier. The Tunguses are known to the Samoyedes by the name of *Aiya* or "younger brothers." The Oroches, Chapogir, Goldi, Lamut, Manjour, Manegre and Oroke are partly in Manchuria and are Tungusic. The Tungus type is essentially Mongolic, with broad flat features, small nose, wide mouth, thin lips, small black and somewhat oblique eyes, black lank hair, dark olive or bronze complexion, low stature, averaging not more than 5 ft. 4 in. The square shape of the skull and the slim, wiry, well-proportioned figure are features especially of the typical Tunguses. They are classed according to their various pursuits, as Reindeer, Horse, Dog, or Sedentary, Nomadic and Wandering Tunguses. A few have become settled agriculturists; but the great bulk of the race are still essentially forest hunters, using the reindeer both as mounts and as pack animals. Nearly all lead nomad lives in pursuit of fur-bearing animals, whose skins they barter in exchange for provisions, clothing and other necessaries of life. The national costume shows in its ornamentation and general style Japanese influence, due to intercourse at some period previous to the spread of the race to Siberia. Many of the Tungus tribes are reckoned as "Greek Christians"; but most of them are still Shamanists and nature-worshippers, secretly keeping the teeth and claws of wild animals as idols or amulets, and observing Christian rites only under compulsion. Family and exogamic clan organization is relatively strong. Intercourse begins before marriage as soon as a portion of the bride price has been paid. Some practise polygamy. Exchange marriages occur. The levirate is common. A man may take his son's widow. Cousin marriage occurs and tree-burial (*q.v.*) is found among them.

See M. Czaplicka, *Aboriginal Siberia* (1914).

TUNICATA, a well-marked class of marine animals, normally distinguished by the possession of an external cuticle of cellulose (the *tunic* or *test*), and of two more or less prominent *siphons*, one inhalant, the other exhalant, leading into corresponding internal chambers (the *branchial sac* and *atrium*), which communicate with one another by a system of ciliated *gill-slits* or *stigmata*. These maintain through the body a circulation of sea-water subservient both to food-collection and respiration. The class was instituted and named in 1816 by Lamarck, who included the fixed Solitary Ascidians or Sea-squirts (the Tethya of Aristotle) and the Compound Ascidians, which form colonies by budding (first distinguished from Alcyonarian polyps in the previous year by Savigny), together with various pelagic free-swimming forms (*Thalia, Salpa, Pyrosoma*), at that time very imperfectly known. The minute tailed Appendicularians, first described in 1819 by Chamisso, were added to the class thirty years later either as larval forms (Joh. Müller, Krohn, Vogt, 1846–1854) or as a definite adult type (Huxley, 1851).

"Acephalous Mollusca."—Cuvier (1798, 1815) ranged the Ascidians alongside the bivalved Lamellibranchs as "Acephalous Mollusca," being led to this view by the similarity of their siphons, and by the interpretation of the combined branchial sac and atrium as a mantle-cavity containing a pair of "branchial membranes." The opening of the oesophagus into the branchial sac was regarded as the true mouth. This view dominated zoology until 1871, when it became clear, as a result of Kowalevsky's observations on the development, that the so-called "branchial sac" was simply a dilated *pharynx*, and that the real affinities of Tunicata were with the Vertebrates, owing to the larval possession of *notochord, dorsal nerve-tube* and *gill-slits*. The group is now recognised as forming with *Amphioxus* (*q.v.*) the lowest section of the Chordata, the subphylum Protochordata of Balfour.

The feature which, above all others, distinguishes this subphylum from the rest of the Chordata is the possession throughout life of an endopharyngeal ciliary feeding mechanism of subdivided *gill-slits*, glandular *endostyle*, and ciliated *peripharyngeal bands*. This apparatus, beautifully adapted for straining off mi-

nute floating particles is still represented by vestiges in Vertebrate embryos (*cf.* development of thymus and thyroid glands, which are modified remnants of tongue-bars and endostyle). Thus the Protochordata have the unique interest of preserving some of the characters of the immediate ancestors of the Vertebrata.

Apart from this the class Tunicata presents a number of special features of considerable physiological interest, such as the presence in the test of "animal cellulose" (*tunicin*, $C_6H_{10}O_5$), the presence in the blood-cells of the rare element *Vanadium*, which probably acts as a catalyst, and, with its five oxides, accounts for the diversified colouring of these animals (Henze, 1911–1913; Hecht, 1918); the reversibility in the direction of the heart-beat; the prevalence of gemmation of different types, whether simple or complicated by polymorphism; and, in Appendicularians, the phenomena of cell-reduction and of partial neoteny.

Classification.—With the exception of a few imperfectly known forms, existing Tunicata fall readily into one or other of three sub-classes named by Herdman (1891) Ascidiacea, Thaliacea and Larvacea. The first includes the fixed Ascidians, both simple and compound, the second the pelagic, tailless, free-swimming types reproducing by budding (inclusive of *Pyrosoma*, which Herdman referred to the Ascidiacea), and the third the minute, solitary, tailed, Appendicularians. The name Larvacea, however, has not received general recognition, and is here replaced by Gegenbaur's older (1878) and in other ways more acceptable term Copelata (from *Kopēlātēs*, oarsman, sculler).

The order in which these groups are here presented is believed to represent the natural, or phyletic, sequence; but the pelagic Thaliacea and Copelata, though far less rich in numbers and variety than the Ascidiacea, are treated in greater detail, both on account of their importance to students of evolution, and from the fact that our knowledge of them has been greatly extended by the oceanic expeditions of recent times, which renders more complete treatment desirable. The classification adopted will perhaps be more readily intelligible as a record of Tunicate evolution if it be added that the ground-plan of the Tunicate pharynx, like that of *Amphioxus*, consists of a median ciliated and glandular groove below (the endostyle), flanked by gill-slits of the *Amphioxus* pattern on either side, *i.e.*, each U-shaped, completely bisected by a tongue-bar, and each half (or *protostigma*) further divided into a row of stigmata by outgrowth of processes (*synapticulae*) from the tongue-bar. It should also be noted that the power of budding is assumed to have been possessed by the earliest Tunicata, since in some form or other many solitary Ascidians, even *Amphioxus* and Appendicularians, retain structures which are probably vestiges of the endodermal budding organ or *epicardium*. (*See* below.) Indeed *loss* of budding has probably been no slight factor in the evolution of the later forms, both fixed and free, by releasing energy for increased size and longer life, or more continuous muscular activity.

Class Tunicata

Unsegmented, hermaphrodite Protochordata with an atrio-cloacal cavity, a recurved intestine and a gelatinous resistant cuticle or test of cellulose.

Order I. Ascidiacea

Sessile, with dorsal atriopore (*cloacal siphon*); pharynx with transverse rows of ciliated stigmata, variously shaped, and an internal accessory apparatus of ciliated bars, ridges or papillae.

Section I. **Enterogona,** Perrier, *sens. lat.* (= *Endoblastica,* Garstang)—Gonads unpaired, lodged in the intestinal loop or projecting behind it; budding epicardial; larva with cerebral eye and otolith.

Suborder 1. Phlebobranchia, Lahille (=*Dictyobranchia,* Seeliger).—Pharynx with accessory, tubular, internal longitudinal vessels, often supporting ciliated papillae; intestinal loop usually alongside pharynx; budding rare (*Perophora, Diazona*), the epicardium in other cases sterile (*Ciona*) or absent.

Families: Perophoridae, Diazonidae, Cionidae, Phallusiidae (=Ascidiidae), Corellidae.

Suborder 2. Haplobranchia, Lah. *emend.* Garst. (=*Krikobranchia,* Seeliger). Pharynx without internal longitudinal vessel bars, but with transverse ciliated ridges (horizontal membran body elongated, with distinct abdominal region, *i.e.*, intestinal always behind the pharynx; budding universal.

Families: *Clavelinidae* (including *Distomidae=Polycitorid* Gonads in intestinal loop, heart alongside, budding purely cardial; *Didemnidae,* Intestinal loop short, gonads projec budding epicardio-intestinal; *Polyclinidae* (=*Synoicidae,* H Gonads and heart behind the intestinal loop, budding by p abdominal (rarely abdominal) fission.

Section II. **Pleurogona,** Perrier (=*Periblastica,* Garst.). (ads parietal (in atrial wall), usually paired; body comp budding peribranchial (lateral); larval brain with otolith, bu separate eye; larval suckers reinforced by a peripheral rin adhesive papillae.

Suborder 3. Stolidobranchia, Lah. (=*Ptychobranchia,* liger). Pharynx with internal longitudinal bars, not tubular sels; its walls often folded longitudinally, or with clusters of representing folds; budding rare (*Botryllidae, Polystyelin* epicardium vestigial or absent.

Families: *Botryllidae, Styelidae* (=*Tethyidae,* Hart), *Te dae* (Huntsman, not Hartmeyer; =*Pyuridae,* Hart, form *Cynthiidae*), *Molgulidae* (=*Caesiridae,* Hart).

Order II. Thaliacea

Pelagic, with mouth and atriopore at opposite ends; pharynx persistent undivided protostigmata; budding from a com ventral stolon, containing both pharyngeal and peribranchial growths.

Suborder 1. Pyrosomata has the following characteris Oozooid incompletely developed. Blastozooids forming a pe nent colony, each hermaphrodite and capable of budding. Pr stigmata numerous, and crossed by internal longitudinal A cerebral eye, and a sub-neural gland, with duct and cili funnel, always present. Fam. *Pyrosomatidae.*—Colony a ho cylinder closed at one end, the zooids imbedded in its w mouths outside, atriopores inside, and endostyles towards closed end (the starting point). Each zooid has a pair of t verse lateral muscles connected with fibres in the common (*colonial muscular system*). A single egg develops in each cl into a ring-like primal colony of 4 zooids (*tetrazooid colo* Phosphorescent.

Pyrostremma, nov. gen. (from *stremma*—a twist or spi =*Pyrosomata fixata*). Protostigmata oblique; a cloacal lang "colonial" muscle crossing the pharynx; also an anterior bira muscle-plexus, concentrated dorsally. Stolon multi-annulate, not migratory. Orifice of colony guarded by 4 test-processes taining muscular test-vessels. Two species, *P. spinosum, agas*

Pyrosoma, s. str. (=*Pyrosomata ambulata*). Protostigmat right angles to endostyle. No cloacal languet or anterior mu plexus. "Colonial" muscle crossing the cloaca. Stolon short; carried to their places by phorocytes. Orifice of colony sphincter in a test-diaphragm containing vascular processes, *P. atlanticum, verticillatum,* etc.

Suborder 2. Doliolida (=*Cyclomyaria*) is characterized Oozooid asexual, free-swimming, and budding freely. Perib chial cavities shallow. Pharynx without internal longitudinal Peripharyngeal bands twisted spirally at their dorsal junc (ciliated spire). Protostigmata in oozooid few (4 pairs), formi transverse series behind the endostyle, in blastozooids more n erous. Oozooid with a dorsal outgrowth to which the free buds carried from the ventral stolon by phorocytes. Blastozooids p morphic, the first being nutritive and sessile (*trophozooids*), second sterile and locomotive (*phorozooids*), the last se (*gonozooids*). Cloaca posterior, atriopore terminal. Intestin oozooid uncoiled, with posterior anus. A subneural gland, duct and ciliated funnel. Eye absent.

Fam. I. *Doliopsidae.* Atria and protostigmata entirely be endostyle. Ciliated spire behind the brain. Somatic muscles forming loops. Stolon extended on to dorsal outgrowth. Bl zooids globose, arranged on the outgrowth in groups, not r *Doliopsis,* Vogt (=*Anchinia, Esch.*). (Oozooid known only

ARTLY AFTER (2) SEELIGER, (3) KOROTNEFF AND NEUMANN, (5) FOL AND LOHMANN; FROM (6, 8) GARSTANG, "MORPHOLOGY OF TUNICATA" IN THE QUARTERLY JOURNAL OF MICROSCOPICAL SCIENCE (CLARENDON PRESS)

TYPES OF THE VARIOUS ORDERS OF TUNICATA

Ascidiacea: top row, Phlebobranchia; middle row, Haplobranchia; bottom row, Stolidobranchia. 2. Pyrosoma colony and a single zooid. 3. Doliopsis (left to right), gonozooid, oozooid and phorozooid; dorsal fragment, oozooid of Doliolium (bottom). 4. Salpida. Salpa fusiformis oozooid (top) and gastozooid (below). 5. Copelata. Top row across, Oikopleura, Fritillaria, Appendicularia; bottom row, Oikopleura, Fritillaria and Kowalevskia. 6. Stages in retrograde evolution: a. Ascidian (cionid); b. Pyrosoma (blastozooid); c. Doliolium (oozooid with gonads); d. Appendicularian, with rudimentary gonads. 7. Clavelina, showing two stages of buds. 8. Budding: a. Hypothetical Protunicate; b. Protothaliacean; c. Endoblastic ascidian (Enterogona); d. Periblastic ascidian (Pleurogona)

ments of dorsal outgrowth.) Phorozooids and gonozooids a praeoral and a supracloacal tentacle, lacking in the trophods. Somatic muscles a pair of S-shaped strands.

am. II. *Doliolidae*. Oozooid and locomotive buds barrelped, the former with 9, the latter with 8, muscular hoops. ooid with an otocyst on the left side, and 4 longitudinal rows uds on its dorsal process—trophozooids along the sides, ozooids down the middle, the latter carrying gonozooid buds heir stalks of attachment. Trophozooids with gaping mouth half-obliterated cloaca. Phorozooid and gonozooid without a-cloacal outgrowth or otocyst. Ciliated spire before the n. Stolon short; buds all migratory.

oliolina, Borgert. All protostigmata (<50) in a transverse s behind endostyle. Intestine U-shaped; e.g., *D. müllleri*, *rohni* (with 3 pairs of lateral vascular appendages). *Dolio*- Q. and G. with antero-dorsal atrial extensions in gonozooid, ying numerous additional protostigmata. Intestine directed wards or twisted to right, e.g., *D. denticulatum*.

Suborder 3. SALPIDA (=*Desmomyaria*)

ooid (*solitary form*, or *nurse*) asexual, free-swimming and budfreely, in general resembling the blastozooids, but tending to ter size (often twice as large) and muscularity. Blastozooids ocomotive and hermaphrodite. Cloaca dorsal, atriopore posdorsal, separated from pharynx by an oblique median vascular (the *gill*), with transverse ciliated stripes and an elongated on either side. Muscles as transverse bands often connected ally (*i.e.*, Desmomyarian), usually incomplete ventrally (*i.e.*, imyarian), with a tendency to polymerisation and elongation loacal siphon in oozooid. Oesophagus ventral. Gut a sinistral , protruding as a postero-ventral hernia, or compressed into mpact "nucleus." A cerebral eye, but no otocyst. No typical al (hypophysial) gland, but a detached ciliated pit in front, below the brain a pair of peculiar pharyngeal diverticula *ra-neural glands*), unpaired in *Thetys*, rarely absent (*Thalia*). olon long. Buds at first vertical in a linear series; then wo alternating rows with atriopores outwards; finally adher- o one another merely by papillae (usually 8). Portions de- ed at intervals as free colonies, usually in chains, rarely els (*aggregated* or *chain forms*), certain features of the blastols being related to this phase (asymmetry of right- and left- l individuals, elevation and forward rotation of eye, adhesive ns, etc.). Ultimately the blastozooids become free and give to embryos (usually 1 each) with placental development.

alp Classification.—The classification of Salps has hitherto based on the idea that a *Doliolum*-like arrangement of cle-bands and an elongated intestine are primitive for the p, as exemplified in *Cyclosalpa*. It is not easy to reconcile view with the retention by Salps of a dorsal cloaca, sinistral stinal loop, and bud-retaining stolon, primitive features which been lost by every Doliolid. It is more probable that the culature in both groups was originally plexiform (*cf. Pyroma*), that Salps have retained this condition more completely Doliolids (the blastozooids more completely than the oids), and that the partial resemblances of certain oozooids to omyaria are examples of simple convergence.

ending completion of certain investigations on the endostyle rstang and Platt, 1928), some results of which are here odied, the following attempt at a phyletic grouping of ous forms is provisional. Metcalf's sub-genera (1918) are ted as natural groups of species, though the homogeneity he *Ritteriella* group is not above question. In *R. amboinensis* marginal bands of the endostyle are asymmetrical.

bbreviations.—M=Muscles, OZ=Oozooid, BZ=Blastozo- The fractions represent the number of conspicuous muscle-

ds in $\frac{OZ}{BZ}$, omitting those of the siphons. Unless otherwise ed the muscles are complete dorsally and incomplete ventrally, the embryos are single on the right cloacal wall.

am. I. *Salpidae*.—Colonies as chains. Intestine in a sinistral , or if elongated (*Ritteriella*), produced backwards. (i.) Inal hernia moderate. Marginal bands of endostyle symmetrical (*Traustedtia?*).

Sub-fam. i. *Pegeinae*.—M in two small dorsal bundles, forking laterally, nearly alike in OZ and BZ: a pair of "tails" in BZ. —*Traustedtia*, $\frac{5}{5}$, with radiating appendages in OZ; *Pegea*, $\frac{4}{4}$ endostyle deep.

Sub-fam. ii. *Iasinae*:—M separate, but incomplete dorsally in OZ, embryos 3–5, endostyle shallow, the accessory gland-tract reduced or obsolete. *Iasis*, $\frac{5}{5}$, no tails, *Thetys*, $\frac{18-20}{5}$, tails in OZ.

(ii.) Intestinal hernia inconspicuous or absent. Marginal bands asymmetrical, the left vestigial or absent.

Sub-fam. iii. *Thaliinae*.—M usually grouped (3–4) in front and separate (2–5) behind, especially in OZ, sometimes complete ventrally. *Thalia*, $\frac{5-6}{5}$, tails in OZ; *Salpa*, $\frac{8-9}{6}$, BZ with unpaired pointed processes in front and behind; *Ihlea*, $\frac{7-8}{6}$, all M in OZ complete ventrally.

Incertae sedis.—*Ritteriella*, $\frac{10-25}{6}$, M connected dorsally by a long anastomosis, intestine loosely coiled and protruding, or in OZ produced backward beneath extended cloaca; *Brooksia*, $\frac{7}{4}$, with ventral muscular proboscis in OZ.

Fam. II. *Cyclosalpidae*.—Colonies as wheels (except *C. virgula*). Intestine in OZ extended forward above the gill. Endostyle with interlocking lips, left marginal band obsolete.

Cyclosalpa, $\frac{6-7}{3-4}$, M highly variable, intestinal hernia in BZ enormous, except *C. pinnata* in which the intestine extends forward below the endostyle! Usually phosphorescent.

Order III. COPELATA (=Larvacea)

This order is characterised by small pelagic forms with one pair of tubular gill-slits (spiracles), reduced endostyle, and a horizontal tail bent forwards beneath the body. Cloaca absent, represented behind by a large, thin-walled tunic-free area which includes the apertures of intestine, spiracles, and gonads (genito-spiracular area). Test differentiated and expanded as a filtering mechanism (the house), formed by thickened ectoderm of the pregenital region (oikoplastic epithelium). From its boundary frequently arises a transverse dorso-lateral fold, directed forwards (dorsal hood or veil). Intestine normally coiled to right of oesophagus. No budding, but epicardial vestiges possibly represented by the pharyngeal packets of *Fritillaria* (and oral glands of *Oikopleura?*). The minute structure of the body is characterised by great economy of cellular elements.

(As elaborations of the test in Appendicularians replace in bionomical value the internal modifications of other Tunicates, a phyletic classification of Copelata should rest largely upon the structure of the house, but various uncertainties prevent us from making use of more than a few conspicuous features. Fol's account of the house of *Appendicularia* [1874] seems to have been misunderstood by Lohmann, who has nevertheless made valuable observations on the house-rudiment [1896, 1899]. This genus is regarded by the present writer, in agreement with its discoverer, as the most central and primitive type of the Copelata. The classification adopted differs accordingly in various respects from Lohmann and Bückman's recent revision [1926]).

(N.B. The terms *anterior*, *posterior*, etc., when applied to the house, are here used in their usual morphological sense, and not with reference to the direction of locomotion, as used by Lohmann. For brevity *oikothelium* is used for *oikoplastic epithelium*.)

Suborder I. ENDOSTYLOPHORA (Garstang, 1895). Pharynx with endostyle. House bilaterally symmetrical, with separate inhalant and exhalant apertures.

Fam. I. *Appendicularidae*.—Intestine tubular, to right of stomach. Rectum ventral, directed forwards. Endostyle an open groove with an anterior tuft of cirri. House enclosing the body, with an anterior (oral) aperture, a paired filtering mechanism above, and a caudal chamber below.

Sub-fam. i. *Appendicularinae*.—Anus behind spiracles, to right of tail-base. Oesophagus ventral. Oikothelium broad and long, giving rise to two dissimilar pairs of fibrillated membranes. Dorsal hood arising far back. House not much expanded, taller and broader than long, caudal chamber vertical (with postero-ventral

aperture?), tail pointing downwards.

Only genus and species, *Appendicularia sicula*, Fol.—body <0·5mm; house <2·6mm. in greatest diameter.

Sub-fam. ii. *Oikopleurinae*.—Anus mid-ventral, between or in front of spiracles. Oesophagus dorsal. House much expanded, usually with lateral filtering windows; caudal chamber horizontal, tail pointing forwards.

Oikopleura.—Stomach bilobed, clamped between dorsal oesophagus and ventral rectum. Mouth with projecting under-lip. The species in general fall into two sections, which differ in details of the oikothelium—(i.) *fusiformis, longicauda*, etc. without oral glands, and (ii.) *labradoriensis, albicans, dioica*, etc. with oral glands. *O longicauda* (=*spissa*, Fol.) is the only species with a postero-dorsal "veil," and a median posterior inhalant aperture to the house, without filtering windows.

In various oceanic types related to the second group, but with gelatinized blastocoele, the intestinal loop opens out, either (i.) vertically (e.g., *Folia, Stegosoma*, etc.) or (ii.) horizontally (viz., *Bathochordaeus* and *Althoffia*). In several respects *Bathochordaeus* approaches *Appendicularia*. The houses of all are unknown. Only *Folia* and *Stegosoma* possess oral glands.

Fam. II. *Fritillaridae*.—Stomach and intestine reduced (oligocytic) and vesicular; anus behind spiracles, on right side. Endostyle without flagella, nearly closed. Genital region produced, blastocoele gelatinised. Oikothelium short and narrow, covered by a dorsal hood arising far forward. No house, but an elastic *filtering capsule*, projected over the mouth from the hood-cavity.

Fritillaria.—Hood not produced in front of snout. The numerous species mostly fall into two groups: (i.) with tail forked, mouth complicated, usually a "pharyngeal packet" behind endostyle, e.g., *borealis, pellucida* (=*furcata*, Fol.), and (ii.) with tail pointed, mouth structure very simple, pharyngeal packet completely wanting or when present very greatly reduced to a small number of peculiar cells, e.g., *haplostoma*.

Tectillaria.—Hood greatly produced and pointed, arising in front of spiracles, and bearing the far greater part of the oikothelium on its lower surface.—*T. fertilis*, Lohm.

Sub-order II. Polystylophora (Garstang, 1895). Endostyle absent. Spiracles slit-like. Peripharyngeal and ventral ciliated bands replaced by 4 longitudinal rows of ciliated processes, forming an endopharyngeal sieve. House capacious, bi-radially symmetrical round a single aperture.

Fam. *Kowalevskidae*.—Oikothelium mainly dorsal, radially arranged around a central boss, under a delicate hood arising far back (Lohmann, 1896). Oesophagus ventral, gut bi-vesicular, stomach left, rectum and anus right.

Only genus and species, *Kowalevskia tenuis*, Fol. (1872).

If the preceding classification accurately resumes the facts of structure and the affinities of the numerous living forms of Tunicata, it presents some remarkable features: the three orders stand at three different morphological levels, but in descending, instead of ascending, order. The Ascidiacea with their transverse rows of stigmata are followed by the Thaliacea, with undivided protostigmata, and these by the Copelata with a single pair of simple perforations. The situation is much the same with regard to atrial cavities and endostyle.

The following considerations appear to justify the order in question as representing a true phyletic sequence. The development of Ascidians shows that protostigmata are the bisected halves of tongue-barred U-shaped slits, as in *Amphioxus*, and that lateral atria actually precede their formation. The possession by Appendicularians of a testless area behind an anterior test-producing one, indicates that the genito-spiracular area is really a shallow atrio-cloacal cavity, like that of *Doliolum*, reduced and everted. The intestinal loop of Tunicates, adult or larval, is sinistral (*i.e.*, rectum to left of oesophagus) except in Doliolids and Appendicularians. Only in these and in one or two Salps is the loop straightened out: only in the same two groups are rectum and anus twisted to the right. The Appendicularian condition is thus the climax of a retrograde evolutional process of which the Thaliacean, especially the Doliolid, type, with posterior cloaca, reduced atria, and a few simple protostigmata (in the oozooid stage of development) is regarded as an intermediate step.

ANATOMY

A general impression of the structure of a fairly typical Asc can be gathered from the figure of *Clavelina* (Pl. fig. 7). In form, as in all Haplobranchs, the intestinal loop lies comp behind the pharynx, and the latter is free from the comple caused by the presence of internal longitudinal bars or ve but these are the only conspicuous points—apart from th rangements for budding—in which the general structure d from that of such a typical "simple" Ascidian as *Ciona*. In the body is erect, fixed by a multitude of "rootlets," and car mouth and atriopore at its upper extremity, the mouth tern the atriopore a little to one side. Between the two siphon the small solid brain, giving off nerves in front and behind defining the dorsal side of the body by its presence. O opposite (ventral) side the endostyle runs along the v length of the pharynx, which contracts immediately behir and is continued by the dorsal oesophagus into the dige portion of the alimentary canal. This consists of a desce limb, including the stomach, and an ascending limb (m rectum) which crosses the other on its left side, the two connected at the bend by a mid-gut or intestine. From lower end of the stomach issues a slender diverticulum forks repeatedly on the wall of the rectum opposite (the py gland). The rectum opens into the cloaca by a dorsal anus.

The cloacal cavity extends along the dorsal side of the pha the cloacal siphon or atriopore being situated in this case a *Ciona* at its anterior extremity. Right and left this cavi continued over the sides of the pharynx as the lateral or peribranchial cavities, which terminate ventrally on e side of the endostyle. Beneath the endostyle runs a large ve blood-channel, which is continued behind into the abdome corresponding dorsal blood-channel runs longitudinally bet the pharyngeal roof and the cloacal floor, and is also conti into the abdomen. The two are connected by transverse nels between the rows of stigmata, and these are connecte smaller channels running longitudinally between adjacent stig the whole constituting a vascular network moulded to the of the pharynx. The heart is always situated in the cour the ventral blood-sinus, but at different points according t position of the intestinal loop. In "simple" Ascidians, in v the loop lies against the left side of the pharynx, the hear close behind the endostyle, as it does also in the young *Clave* but during the later growth of *Clavelina* and its allies the intes loop stretches considerably downwards, and the heart is ca with it, in Polyclinids even beneath it into the "postabdome

The heart itself in all Tunicates is part of a larger struc the *cardio-pericardial vesicle*. This is at first a closed oval arising ventrally to the gut. Its dorsal wall becomes invagin and the invaginated epithelium becomes contractile. The vesicle constitutes the heart, the outer the pericardium, the being separated by the pericardial cavity. The lips of the ca invagination tend to meet, thereby closing its cavity, except a two ends, where they remain open to the blood in the ve sinus. The heart undergoes waves of contraction either behind forwards, or from before backwards, the whole co of the circulation being subject to periodic reversal.

In *Clavelina* the roof of the cardiac groove is partly prov by a third structure, the *epicardium*, an epithelial septum v arises as a pair of outgrowths from the hinder wall of the pha on either side of the endostyle. These epicardial diverticula behind the pharynx into a single tube, which becomes flatt dorso-ventrally and extends down the abdominal cavity thin broad septum between the main dorsal and ventral b channels. It continues its course into the small branching lets by which the *Clavelina* is attached (*the creeping stolon*) relations with the circulatory system appear to be secondary real *raison d'etre* is to be found in the budding process.

In *Ciona*, which never buds, the two epicardial outgrowth present in a modified form; they remain distinct, and the c of each expands to form a *perivisceral space* behind the pha

e left sends prolongations into the numerous rootlets of attach-nt, and thus also functions as a septum dividing afferent and erent blood-streams both in the free rootlets and in other ular outgrowths (the *test-vessels*) which penetrate the sub-nce of the test covering the body itself. In other less primitive lebobranchs, in which the test becomes greatly thickened, these entitious outgrowths become greatly multiplied, but in the jority of these cases the epicardium is vestigial or altogether ent, and the septation of the test-vessels is accomplished by gitudinal folds of their own walls. This secondary process of tation may proceed so far as to divide each vessel into two nplete and parallel halves, the so-called *double-vessels*. In lgulids, which possess such vessels, the vestigial epicardia are verted into a pair of renal excretory organs; but both in lgulids and *Ascidia*, the test-vessels are mainly or entirely ived from a basal vessel opposite the end of the endostyle.

The reproductive organs, as in all Enterogona, consist of a gle lobulate ovary and testis, each provided with its own t, which runs alongside the intestine to open into the cloaca. e two glands occupy the typical position in the loop of the stine. Among the Pleurogonous Ascidians the loop of the stine tends to open out, and the lobules of the gonads become pendent and dispersed (*polycarps*) over the wall of the atrial ities, in some cases with a remarkable degree of metameric ularity, recalling that in *Amphioxus*.

MODE OF NUTRITION

The Endopharyngeal Apparatus.—The *endostyle* has a racteristic and very constant structure throughout the Asci-cea. It is a deep groove with high upstanding edges, which strongly ciliated as the *marginal bands*, the general pharyngeal helium being unciliated. The bands unite behind the endostyle, at the anterior end they diverge right and left and encircle pharynx in front of the first row of stigmata as the *peri-ryngeal bands*. In the mid-dorsal line they unite once more form a single ciliated tract which runs backwards as the or *hyper-pharyngeal band* until it merges in the general cilia-at the entrance to the oesophagus. On one side the dorsal es of the various *horizontal membranes* are produced as a es of *dorsal languets*, which in life are recurved upon them-es like so many flexible hooks. The edges of the horizontal mbranes are ciliated. Between the endostyle and the oesopha-aperture runs the *retropharyngeal band*, also ciliated.

Within the groove of the endostyle run 3 pairs of longitudinal ts of gland-cells, of which the two lower pairs resemble one ther in their wedge-like section, and may be distinguished as *primary tracts*, comparable with those in *Amphioxus*, while upper pair, consisting of cylindrical cells, constitute the *ac-ory tracts*. When any reduction takes place, these are the to go (e.g., *Distaplia, Doliolum, Iasinæ*). The three tracts separated from one another on each side by two narrow ds of minute ciliated cells (the *intermediate bands*). The floor he groove is composed of a few rows of small cells bearing flagella, which reach to the top of the groove. These dis-ear only in the Copelata.

This apparatus works as follows. The gland cells pour into the ve a constant stream of mucus-like slime, and, apparently by action of the long median flagella, this is thrown out into the eral cavity of the pharynx. The cilia bordering the stigmata t outwards into the atrial cavities, and cause a strong stream vater to pour in through the open mouth. The slime from the ostyle is carried with the water towards the nearest gill-slits , the ventral ones), but is at once worked into the form of gitudinal threads which, alighting upon the ciliated edges of horizontal membranes, are swept dorsally, and entangle ended food-particles as they are rolled upwards in rapid cession. The combined marginal and peripharyngeal bands vey a separate stream of mucus directly round the front end he pharynx into the hyper-pharyngeal groove, along which it ams backwards to the oesophageal aperture, supported by the sal languets. Fringes of slime trailed off the peripharyngeal ds connect with the series rolled up from the endostyle, and all become entwined together dorsally into a single rotating cord of mingled slime and food-particles which passes uninterruptedly into the oesophagus.

In *Clavelina*, owing to its perfect transparency, this process can be readily observed by adding powdered carmine to the sea-water round a living example under a binocular microscope. In other types of Ascidians the phenomena cannot be followed so completely, but there is good reason to believe that all the elaborations of the Ascidian pharynx are so many contrivances to the same end. The longitudinal bars and terminal papillae of Stolidobranchs and Phlebobranchs assist the process by muscular means, swinging to and fro transversely in such a way as mechanically to pick up the longitudinal slime-ropes and push them upwards from one bar or papilla to the next. The concave "minute plications" or "meshes" of Phlebobranchs, and the longitudinal folds of Stolidobranchs subserve the same purpose by withdrawing the perforated surface of the pharynx away from the collecting surface, and by concentrating the longitudinal bars of the latter into closer proximity. In this way a secondary collecting sieve is produced within the primary current-producing one—which enables a stronger stream to be poured through the pharynx without waste of food-particles. The formation of this inner cyclinder of muscular bars and ciliated ridges explains the elevation of the side-walls of the endostyle to its own level.

In Thaliacea the mode of food-collection changes. Except at its extremities, the endostyle of *Doliolum* is closed by apposition of its lips, and the slime is all driven forwards and upwards along the peripharyngeal bands, from which it is trailed off in fringes by the current which sets towards the gill-slits behind. The fringes of each side are carried dorsally until their bases meet in the "ciliated spire," where they are twisted together into a rotating cord, the free end of which is directed diagonally through the pharyngeal cavity into the oesophageal aperture. The moving fringes thus constitute a conical sieve at the entrance to the pharynx, although the individual threads are constantly being caught into the food-rope dorsally and renewed from the endostyle ventrally (Fol, 1878).

In *Salpa* the *modus operandi* is not so clear. The ciliated stripes across the sides of the gill appear to play much the same part as true gill-slits and the food-rope passes backwards along its lower face, instead of freely traversing the pharyngeal cavity. (Fol, *l.c.*). The fringes of *Doliolum* are replaced by an almost continuous "curtain" of mucus in *Thalia democratica*, but the whole process needs re-examination in relation to the great variations now shown to exist in the structure of the Salp endostyle, which presents every gradation from a flat symmetrical *Amphioxus*-like pad in *Iasis* and *Thetys* to a closed tube with asymmetrical marginal bands in *Salpa* and *Cyclosalpa*.

In Copelata Fol's experiments on *Oikopleura* leave no doubt that the mucus from the small endostyle only supplies the peripharyngeal bands, which function essentially as in *Doliolum*. The pharynx, however, merely imbibes food-particles already concentrated by previous filtration in the "house," one function of which, at least in forms with "filtering windows," is the exclusion of all but the minutest pelagic organisms (the *Nannoplankton* of Lohmann). The meshes of the filtering windows of *Oikopleura* exclude almost every organism exceeding 30μ in diameter, and the internal filter-tubes entrap organisms as small as 3μ. Thus *Chaetoceras*, the elongated *Rhizosolenias*, *Ceratium* and most Radiolaria are excluded, while the food captured consists mainly of small *Nitzchia*, Chrysomonads, Peridinia, naked Flagellates, Rhizopods and Bacteria between 3μ and 20μ in diameter (Lohmann). Thus the reduction of size and structure in Appendicularians is to be connected with their having tapped a rich reserve of minute food which is wasted by other Tunicates, and the organ elaborated to this end is no longer the pharynx, but their wonderful filtering house, the only clue to the origin of which is provided by *Doliolina*, which has the habit of periodically exuviating its barrel-like test.

DEVELOPMENT

The egg of Ascidians furnishes one of the typical examples of

"mosaic" structure and predetermined development, contrasting remarkably in these respects with that of *Amphioxus*. In *Styela* (*Cynthia*) *partita* destruction of one blastomere in the 2-celled stage results in the formation of a half-gastrula, which may develop even into a half-larva, with notochord, muscles, and mesenchyme all lying on one side of the neural folds. The embryo possesses little or no power of regenerating the missing parts—a remarkable fact when one notes the great regenerative powers of adult Ascidians.

It follows that the early stages of development throw no particular light on pre-Tunicate history; they point forwards to the larval organisation, and not backwards to pre-Chordate ancestors. Neural and neurenteric canals are formed; the archenteron differentiates into pharynx in front, into notochord and mesoderm behind; and the tail in its growth backwards carries with it extensions of the neural tube and of the posterior group of archenteric derivatives. The whole of the intestinal loop arises as an outgrowth from the pharyngeal rudiment. The mesoderm divides at once into somatic and caudal portions; no enterocoeles are produced; the somatic portion breaks up into blood corpuscles and wandering cells, and the extended caudal portion differentiates *in situ* into muscle-cells on either side of the notochord. The whole of the embryonic processes lead directly by the nearest route to the building up of the larva, which is characterised by three features, a locomotive tail, an organ of fixation, and a transitory sensory and nervous mechanism controlling them. Until the close of larval life feeding is entirely suspended, and usually only the rudiments of the pharyngeal mechanism are established prior to fixation and metamorphosis.

The larval brain is developed from an enlargement of the neural canal near its anterior extremity (the *cerebral vesicle*), in the wall of which two sense-organs normally arise, a stalked unicellular *otolith* in front, and a multicellular *eye* behind. As the cerebral vesicle dilates unequally, the otolith cell migrates from a mid-dorsal to a ventral position, while the eye remains postero-lateral. Simultaneously the cerebral vesicle becomes gradually constricted off on the right side, and from before backward, leaving a narrow canal on its left, which is continuous with the neuroporal extremity in front and the main part of the neural canal behind. According to the extent of the constriction the cerebral (now the *sensory*) *vesicle* may open into the neural canal behind, or be completely cut off from it (*Botryllus*). Its postero-ventral wall becomes greatly thickened as the *larval brain* ("visceral ganglion"), and gives off nerves to the adhesive papillae in front and, along the neural canal, to the caudal muscles behind, but gives no nerves to the viscera. There is thus a stage of development when the neural canal is forked in front, and into two unequal branches,—a short dilated branch on the right, the sensory vesicle, and a longer narrower canal on the left. The apex of this canal fuses with the pharyngeal wall close to the base of the oral siphon, and becomes converted into the *ciliated funnel* in front, and the *subneural duct and gland* behind. This remarkable feature of the development is not without many minor modifications in different types (esp. *Botrylloides*), but the important point remains that, except in Salps, ciliated funnel, duct and neural gland are invariably developed from the foremost region of the neural canal.

The sensory vesicle, larval brain and caudal nerve-cord are entirely destroyed by phagocytes at the metamorphosis. The adult brain arises as a proliferation from the hinder end of the sub-neural ("hypophysial") duct, and the viscera are first innervated after its formation. The caudal part of the neural canal naturally disappears with the tail at metamorphosis, but the pharyngeal portion appears to persist in certain cases as the "rapheal" or "visceral" cord. The neural canal accordingly gives rise to two independent nervous systems, one after the other, for larva and adult respectively, as well as to ciliated funnel, duct, and gland in front of them.

In Enterogona the atrium arises in the embryo as a pair of ectodermal invaginations, and their dorso-lateral apertures usually remain separate until fixation, when they unite dorsally to form the cloacal siphon. Two pairs (rarely one only) of simple gill-slits now arise, either simultaneously (Enterogona) or succ sively (Pleurogona). Normally the pharynx persists in this st over the larval period, but after fixation it expands greatly, rapidly increases its fenestration. The various modes are ducible to the remarkable process exemplified in *Ciona*. E primary perforation elongates ventrally, turns back on itself its lower end, and divides into two at this point. The short li extends dorsally until two equal and parallel "protostigma have been produced from the original single perforation. Thi the evidence for regarding the gill-slits of Ascidians as essenti similar to those of *Amphioxus*. Here, however, by a modificat of the growth-process, the U-shaped form is attained by the slit extending round the tongue-bar, instead of the tongue- growing down into the slit. Although the rows of stigmata u mately produced may be very numerous, no Ascidian ever sh more than 3 pairs of these potential U-shaped slits, for with creased size the later fenestration of the pharynx is produced the subdivision of the 6 rows of stigmata first formed.

The process just described undergoes considerable abbre tion in most types. In Stolidobranchs, other than Molgulids, primary perforations elongate into protostigmata, but do not curve; and in all Haplobranchs even protostigmata cease appear as such, owing to the precocity of synapticulation.

BUDDING AND REGENERATION

It is highly characteristic of Tunicata that their buds poss a certain complexity from the outset of their formation. Ascidiacea the ectodermal envelope of the bud, continuous w that of the parent, includes from the start an inner vesicle, rived as an outgrowth from some internal organ. The in vesicle gives rise to all the organs of the bud except the out most skin with its covering of test. It usually becomes trilob the lateral lobes developing into atrial chambers, the middle l into pharynx, gut, pericardium and nervous system. But original inner vesicle has a different origin in the two prim groups of Ascidians—in Enterogona from the endoder pharynx, through the intermediation of the epicardium, and Pleurogona directly by outgrowth from the outer peribranch (ectodermal) wall. Thus two modes of budding are distingui able, viz., epicardial (or pharyngeal) and parietal (or p branchial). The former alone is associated with the formation a stolon, the apex of which is provided by a ventral promine of the larval body beset with three "suckers" for fixation. Af fixation (e.g., *Clavelina*) the larval body rotates on this vent prominence, through a horizontal to an upright position, and epicardium enters the stalk thus produced, dividing with it in its subsequent ramifications. In Haplobranchia the intestinal l also usually extends into the stalk, and the dilatation of this form the abdominal cavity causes the epicardium to be greatly tended between its point of origin behind the endostyle and basal zone where budding normally proceeds.

In the Pleurogona (e.g., *Botryllus*) these changes do not ta place. The adhesive papillae are surrounded in the late larva a marginal ring of additional processes (ampullae), fixation tak place over a much wider area, and the body normally retains more or less horizontal attitude. The apex of the stolon is th buried beneath the area of fixation, and only Molgulids prese vestiges of the original epicardium. The parietal origin of buds in this section is thus correlated with a distinctive type metamorphosis, which is plainly secondary.

In Thaliacea the primitive ventral position of the epicard stolon is retained, but the stolon itself presents a more compl structure, uniting the two modes which in Ascidiacea are sep rated. It is traversed by a median or paired outgrowth from back of the endostyle as well as by a pair of atrial diverticu The buds are produced by direct segmentation of the stolon, a in *Pyrosoma* the various parental outgrowths give rise in the b to the same organs as those from which they arise, *i.e.*, t pharyngeal outgrowth reproduces a pharynx, and the atrial ou growths produce atria. In *Salpa* this specificity of the stolon components is less complete, and in *Doliolum* it has largely d appeared.

ssuming the process in *Pyrosoma* to be relatively primitive, ould seem that budding has much in common with regenera- . In *Amphioxus* the various tissues have a certain power of -regeneration, like repairing like, but incapable of more drews, Franz). Many small Ascidians undergo periodically a cess of thoracic degeneration followed by repair, which implies retention of undifferentiated material at the base of pharynx atrium, where growth normally takes place most actively *Diazono-Aphanibranchion,* Oka). We may safely assume in primitive Tunicates thoracic degeneration was a normal nomenon, and that the machinery for rapid repair took the mon form of regenerative disks or pockets in these places. there is a certain antithesis between regeneration and bud- . Only when budding is slight is regeneration useful: the ir of the individual ceases to be important when new indi- uals are turned out rapidly by mass-production.

t thus seems possible to account for the variety in the modes Tunicate budding by assuming that the primitive Tunicate sessed a simple stolon like that of *Cephalodiscus* and regener- e pockets at the base of pharynx and atrium. As the special- ion of the ectoderm for test-production tended to disqualify ectoderm from playing its original major part in the budding cess (e.g., *Cephalodiscus*), the descent into the stolon of ex- ions from the regenerative pockets would produce a complex on like that of Thaliacea, with the result of speeding up the of budding and reducing the value of mere regeneration. elimination of one or other pair of stolonial elements in idiacea may be readily associated with the changes already cribed in their respective attitudes after metamorphosis.

he organisation of the buds to form locomotive colonies in the liacea has been outlined in the systematic part. Both in *osoma* and the wheel-colonies of *Cyclosalpa* the integration hes a notable degree, even though in the latter case the zooids ain capable of a free life after break-up of the colonies. The owing early account of the wheels of *C. pinnata* is worth ing from oblivion: "A beautiful sight, these rings of a dozen tinous finger-long individuals, all set vertically with their ths above (and with their ventral 'ins' converging to the tre like the spokes of a wheel), swimming about with thmic motions as if controlled by a common will, now gently king, now twisting and turning, or steering straight on through quiet water" (translated from Carl Vogt, *Bilder aus dem er-leben,* 1852).

Equally noteworthy are the arrangements in Doliolids by ch clusters of small amoeboid "phorocytes" take possession he small buds, as they are detached from the ventral stolon, transport them to their places on the dorsal outgrowth. In *osoma,* where the conditions are simpler, these phorocytes emble the ordinary stellate and spindle-shaped "test-cells," must be regarded as test-cells devoted to this particular task. *Doliolum* they are proliferated in great numbers by the ecto- m at the base of the stolon (Neumann), although the test lf is homogeneous and ordinary test-cells are absent. The arkable capacity of some Tunicates to return to a less differ- iated condition is discussed in detail in the article DEDIFFEREN- TION.

TUNICLE, the distinctive vestment of the subdeacon at mass, ctically identical with the dalmatic (*q.v.*)

TUNING-FORK, a two-pronged instrument of high-grade el, which by the vibration of its prongs gives out a single pure musical tone of constant pitch. The pitch depends upon the natural period of vibration of the prongs, that is, upon their length and thickness. Tuning-forks may be made for all musical pitches in the audible range, and the fork which gives the A above middle C is usually taken as the musical standard. For laboratory purposes the forks may be mounted upon hollow boxes to increase the volume of sound by resonance. They may be set in momentary vibration by a light blow, or kept in constant vibration by the action of an intermittently energized electromagnet upon one of their prongs. The tuning-fork was invented by John Shore in 1711. (*See* PITCH.)

THE TUNING FORK, INVENTED IN 1711

TUNIS, capital of Tunisia, situated in lat. 36° 48′ N., and long. 10° 12′ E. The town stands on a mountainous isthmus which separates the Sebkha Sedjumi from the Bahira, or Lake of Tunis, the west bank of which it occupies; La Bahira communicates with the sea 10 km. E.N.E. of the town by a narrow, open channel, on the margin of the shore. Tunis has the same natural advantages as those which made the fortune of Carthage, being situated on the threshold of the western bay of the Mediterranean, at the natural outlet of the Tunisian Tell, and in easy communication with the south and centre of the Regency. But its topographical situation differs profoundly from that of the ancient town; built at the end of a shallow lagoon, it has been obliged, until recently, to make use of an intermediate town, La Goulette, for its sea trade. While Carthage had an almost insular position, Tunis was sheltered from the attacks of Christian fleets and has an almost continental site.

Tunis consists of two towns side by side; the old native town lies between the hills of Bir-Kassa and those of Ras-Tabia, on a slope down to the Bahira; the European town has developed in chequer-pattern on the flat, low-lying ground between old Tunis and the lake.

European Tunis is built on a regular, somewhat monotonous plan; the blocks of houses are bordered by rectilinear avenues, some of which are planted with trees. One large avenue, 1,500 metres long, has been laid out from east to west, and bears successively the names of Avenue Jules-Ferry, Avenue de la Marine and Avenue de France. On this artery stand the Residency, surrounded by gardens, the cathedral, the casino-theatre, the banks, and the principal hotels and cafés. It is cut at right angles, near the middle of its length, by another avenue called, in its southern part, Avenue de Carthage, and in its northern part Avenue de Paris, which stretches for more than 3 km. from north to south. From these two main avenues numerous streets branch off, the chief being the rue Es-Sadikia, which ends at the railway station, the rue de Rome and the rue d'Italie, with the post office, the market and the Protestant church. The Avenue de France is the most animated street of Tunis and is the centre of the city's life; it ends at la porte de France, from which start the tramways that go around the native town, and beyond which is the small Place de la Bourse, with the British consulate and the old Frank quarter, where the Europeans and the various consular representatives live.

The native town itself includes three distinct parts; the Médina, or central city, which represents the primitive settlement, several gates of which are still standing, and recall the nearly oval form of the ramparts, now replaced by a girdle of streets and boulevards; the suburb of Bab-Souika on the north, where the Jews live; and that of Bab-Djazira on the south. The rue de la Kasba and the rue de l'Eglise cross the Médina; they lead to the Djamâ Zitouna, or mosque of the olive-tree, which is the seat of an important Muslim university, founded in 732 by the Ommiad governor, Obeid-Allah, and reconstructed by the Aghlabides (9th century); most of its buildings date from the 13th to the 15th centuries. Behind the Zitouna are the suks, which are the most interesting feature of the native town; they date from the Hafside period, and are composed of little shops opening on

to narrow, tortuous streets, covered by arches or roofs of planks, where only foot passengers can go. Each kind of trade, each group of craftsmen, has its special quarter. Tunis possesses many mosques, notably those of the Kasba (13th century) and Sidi-Mahrez (17th century), but Christians may not enter them.

The port of Tunis was constituted in 1893 by the digging of a sea channel more than 10 km. long, with a depth of 6½ metres, recently increased to 9 metres; this channel gives access to a basin 12 hectares in extent; a second basin, for the export of phosphates, was made in 1905; 3,985 ships, registering 3,589,000 tons have entered the port of Tunis-la-Goulette; the tonnage of merchandise has reached 1,695,000 tons and the number of passengers 111,000.

The population of Tunis is 185,996, of which 82,729 are Muslim, 24,131 Jews, and 79,136 Europeans (27,922 French, 44,076 Italians, 4,994 Maltese, 2,144 various other Europeans). If the suburban population be added, the total is 118,000 natives and 86,000 Europeans.

South-east of the city, along the valley of the Wadi Melain, are hundreds of large stone arches, magnificent remains of the Roman aqueduct from Zaghwan to Carthage. At Zaghwan (38 m. by rail from Tunis), over the spot whence the spring which supplies the aqueduct issues from the hill, are the ruins of a beautiful Temple of the Waters. The spring is now diverted direct into the aqueduct and is not visible at the surface.

Tunis existed in the Carthaginian epoch, but its importance dates only from the Muslim conquest; it was then that Tunis replaced Carthage politically and commercially. It became capital towards the end of the 9th century, under the Aghlabides, and reached its greatest prosperity in the Hafside period, when it is said to have surpassed Cairo. Attacked in 1270 by Saint Louis, who died under its walls, it was taken by Keir-ed-Din Barberousse in 1533. Charles V. took possession of it in 1535; the Spanish were driven out in 1569, re-took it in 1573, but ceded it to the Turks in 1574. Since then the history of Tunis is merged in that of Tunisia (*q.v.*).

TUNISIA, a country of North Africa under a French protectorate, bounded on the west by Algeria, on the north by the Mediterranean, on the east by the Syrtis (Gulfs of Hammamet and of Qabes) and by the Italian territory of Libya from the sea to Ghadamès, on the south by the Sahara (Southern Territories and Algeria). It reaches from 30° to 37° 20′ (Cap Blanc) N. lat., and from 7° 35′ to 11° 40′ E. longitude. The total area is somewhat less than 49,000 sq.m., of which about 21,500 sq.m. is Saharan territory beyond the Shott Jerid, while the remainder is Tunisia proper. The country is placed half way between the Straits of Gibraltar and the Suez canal and, with Sicily, forms the barrier between the eastern and western Mediterranean. This situation, to which ancient Carthage owed its greatness, together with the possession of nearly 900 miles of coastline, gives Tunisia special economic and political importance.

Structure and Relief.—The mountains are formed of Secondary and Early Tertiary rocks, while later Tertiary and Quaternary rocks cover the plains. The folds are Miocene in the main, as in the Atlas, but movement continued long after that period. There are numerous short discontinuous chains of varying orientation, and a number of small circular or elliptical domes.

The *Northern Zone,* continuing the Algerian coastal forest, includes Kroumirie and the Mogods; Numidian sandstone is a dominant element. It is bounded southwards by the Medjerda valley, which widens into the plain of Suk-el-Arba (Dakhla basin), an old lake basin filled with alluvium, then narrows to form the gorges of Bejaura, and finally enlarges into the great plain of Late Tertiary deposits that extends between Bizerta, Mateur and Tunis. The large *Central Zone* is nearly 180 m. long by 90 broad, extending from Tebessa to Cap Bon, and from the Medjerd Sbeïtla, and including the continuations of the Saharan Atl Algeria. South of the chains of Kef and Tebursuk are the ce plateaux of Tunisia, the Mactar massif, a large Cretaceous c partly covered by Lower Eocene deposits, including phosp marls, while the calcareous elements stand out as hammadas kalaas, plateaux with abrupt sides, *e.g.*, the Kalaa-es-Senan (ft.). In this massif folding is barely discernible. Next follow chains of Thala, a projection of the main Tunisian ridg Zeugitan chain which begins at Jebel Serdj, is continued in Bargou and the Zaghouan (4,249 ft.), an important dom liassic limestone with sharp features and almost vertical walls ends in Jebel Ressas and Bou-Korneïn, on the Gulf of Tuni related fold forms the Cap Bon peninsula. Attached to the system are the Chambi and Feriana chains. The *Southern* includes the chains of Sidi Aïch, of Gafsa, which include phosphatic deposits (Metlaoui-Aïn-Moularès), of Shott Fed in an elliptical curve from Tozeur to Qabes. Eastern Tunis occupied by large plains (less than 1,300 ft. above sea-le which form 80% of the surface of Tunisia and are the Byza of the ancients, the Sahel of Sous and Sfax, with their sp climatic and vegetative features. Beyond the great depressio the Shotts Gharsa, Djerid and Fedjedj, which are in part b sea-level, are the calcareous platforms of the Matmatas and Ourghammas (Jebel Demmer and Jebel Douirat), separated the sea by the coastal plain of Jeffara.

Climate and Hydrography.—With a Mediterranean clim Tunis shows less contrasts in its different regions than do the the steppe and the Sahara in Algeria. Here the Tell is, in pl half steppe, and the steppe half Tell. The average January perature at Tunis is 52·7° (max. av. 59·7°, min. av. 45·6°); hottest month has an average of 79·2° (max. av. 92°, min 66·4°). The winds are chiefly north-west in winter and north in summer; the rainy season runs from October to May, and dry one from May to September; January is usually the rai month, but in the interior spring rains are rather importa summer rains are less exceptional. The distribution of rai however, highly irregular from region to region and from to year; North Africa, in general, is in a zone of climatic dis tinuity, and a small change of the winds may mean great cha in rainfall. One zone gets more than 600 mm. of rain per an and this includes the massifs of Kroumirie and Mogods Draham, 5,384 ft.); the next zone, with 400–600 mm. of includes central Tunisia, the valley of the Medjerda, Cap and the region of Tunis (Tunis 404, Teboursouk 513, Kef 4 a zone with 200–400 mm. south of the Tunisian ridge includes region of Qairwan and the Sahel (Qairwan 289 mm., Susa Sfax 209); a zone with less than 200 mm. in the south and extr south (Qabes 180 mm., Gafsa 155, Medenine 136). The Tuni ridge forms a climatic barrier; the north-western side is a pa the Tell (Tunisian-Friquia); the south-eastern slope belong the steppe region. In the Sahel, the olive prospers, in spite o low rainfall, on account of nearness to the sea and importanc the dew. In the extreme south the influence of the sea still t pers that of the Sahara.

The principal river is the Medjerda, rising in Algeria near Ahras and flowing into the Mediterranean near Porto Farina is 228 m. long; its chief affluent is Wad Mellègue, which joi on the plains of Suk-el-Arba; Wad Siliana brings it the drai of central Tunisia. In flood time the volume of the Medjerda be 1,000 cu. metres; in drought it may go down to 1 cu. m This river has formed large alluvial plains, filling up the anc Gulf of Utica and joining up a series of shore islets. The ri of the eastern slope (Wad Zeroud, Wad Merguellil) dry u basins of the lowland which communicate with the sea only w rains are exceptionally heavy.

The north coast is much dissected with outstanding poi C. Negre, C. Serrat, C. Blanc, Ras Sidi Ali el Mekki. Stan out to sea is the island of Galite; the Lake of Bizerta has kept depth because the alluvium is deposited in the Garra. Agi above it. The Lake of Tunis, on the other hand, is very shal

Beyond the Cap Bon peninsula, the eastern limit of the

Tunis, the east coast is low and sandy, bordered by lagoons in eral places, and shelving slowly into shallow water around the kennah archipelago and Gerba island.

lora and Fauna.—These are Mediterranean, 1,350 out of 00 plant species occurring also in Italy. Forest, scrub and ope are the characteristic formations. The cork oak and the n oak are dominant in the north and, in Kroumirie, form com- t blocks (160,000 hectares). The woods of the centre are far compact, and the Aleppo pine (850,000 hectares) and the ever- en oak are the chief forms. In the south one finds, chiefly, the iper and the wild olive, with some Aleppo pines and pistachio s. Wad-Tala has a forest-steppe with gum trees (*Acacia ila*), the most northerly occurrence of a species found from egal to Arabia. The scrub is usually degraded forest, and its st characteristic tree is *Zizyphus lotus*, the spiny jujube tree. steppe is covered by grass-like types such as the alfa. Of Salsolaceae alfa covers about 1,500,000 hectares.

he mammalian fauna is mainly eurasiatic, but among reptiles fishes some Africano-Brazilian forms persist. In general, the na is much like that of Algeria, with European species, espe- ly in the forests of cork oak. *Cervus elaphus barbarus* (stag) ound in Kroumirie and the sleeved mouflon in the mountains.

eople.—The population (1926 census) is 2,159,708, of whom 2,184 are Muslim, 54,243 are Jews and 173,281 Europeans. ost everyone, native and European, lives in towns or on the st; the interior is almost empty. The Muslim are mostly ber mixed with Arab, but Berber speech has died out, though urvives in Morocco, Algeria and Tripolitania. The population Gerba belong to the same Muslim group as the Mozabites of eria, that of the Kharedjites or Ibadhites. Of the Muslim some ,000 are tent-dwellers, 572,000 live in gourbis, and 477,000 in ses. The Matmatas are troglodytes, and dwell in caves or fas cut in rock or clay (100,000). The native element in the ns is much stronger than in Algeria, 90 agglomerations have e than 2,000 natives each and account for 40% of the total. rt from rural folk who have become urban, the towns contain e primarily urban elements such as the Andalusian Moors and Jews. Europeans include 71,020 French, of whom 33,272 are isian-born; 89,216 Italians including 50,395 Tunisian-born; 6 Maltese, and 4,649 other Europeans. In 1911 the number rench was 46,000, against 88,000 Italians. By a law of 1923, dren born in Tunis of parents who were born in Tunis too me French on attaining their majority, whatever their ulti- e origin, unless they definitely choose otherwise. For Maltese xtra generation is needed, and individual naturalization of ans is possible only in virtue of the terms of the Franco- an convention of 1896. Under the new legislation about o Maltese and 5,000 Italians have acquired French nationality. Tunisian towns have 109,000 European inhabitants, or about % of the total, nearly 50% being in Tunis itself.

owns.—Tunis (*q.v.*) is the chief city, with 185,996 people ,860 native and 79,150 European). With its suburbs, the lation is 204,000 (118,000 native and 86,000 Europeans). ; the capital of the south, has within its walls 27,723 people 84 Europeans), but in the olive groves near the town an tional 44,000 raises the real population of the agglomeration 2,000. Susa has 21,298 people (6,856 Europeans), Bizerta 93 (6,738 Europeans), besides 4,155 Europeans at the arsenal erryville. Qairwan has 19,426 people (629 Europeans), Beja 68 (1,911 Europeans). Another type of agglomeration is the agricultural village: Msaken (16,583), Moknine (12,155), a Kebira (11,830). Still another type is that of the southern s, Qabes (15,119), Mafta (13,250), Tozeur (11,056), Zarzis 05), El-Hamma (4,905) and Gerba (4,645).

overnment and Administration.—Tunisia became a pro- rate of France by the Treaty of Bardo (May 12, 1881), se rights were defined by this treaty and by the convention of 8, 1883. A resident-general of France, under the Ministry oreign Affairs, sits beside the native bey and controls all the ic services. The army, education, finance, public works and ulture have French directors; the native ministers, under ch supervision, are the minister of State and the minister of justice. The budget is examined by the Grand Council of Tunisia, constituted under decrees of July 13, 1922, with elected members, some French and some native. There are also five regional councils (Bizerta, Kef, Tunis, Susa, Sfax), and also caïdate councils. Municipalities have been established in the most important towns. Native administration is based upon the division of the population into caïdates and sheikhates. French officials called *contrôleurs civils* are stationed beside the caïds, and play the same rôle with regard to them as does the resident with the bey. Tunisia is divided into 19 *contrôles civils* and 37 caïdats. The south forms military territories administered by officers of native affairs. The principal direct taxes are the capitation tax (*istitan*), the tax upon olive trees and date-palms (*canour*), upon cereals (*achour*), upon vineyards, and upon cattle; the chief indirect taxes are the customs dues, postal duties, registration, etc. To these must be added the revenues from monopolies, the receipts from postages and transfers of domanial. The budget amounts to 380 million fr. of receipts and expenditure. There are two tribunals of first instance, those of Tunis and of Susa, with reference to the court of appeal of Algiers, and 15 justices of the peace. For natives, the cadi is judge in all matters concerning personal matters and real estate, when Europeans are not involved; other affairs are judged by the caïds, or regional tribunals.

Land, Tenure and Settlement.—Tunisia has *Melk* lands which are completely freehold, *Habou* lands subject to special rules of inheritance, and tribal or group-lands. A Cadastral register was established by law in 1885, with the object of lessening doubts as to ownership of land and of giving proper publicity to transactions involving landed property. Since 1886, 1,200,000 hectares of land have been registered. Colonization depends mainly on private enterprise, and the Government has come late into the matter. By laws of 1914, 1920 and 1924, those who take up previously domanial lands must live on them for life or 20 years. *Habou* lands can be leased for long terms on payment of a perpetual rent (*Enzel*), which rent may be redeemed on a basis of 20 years' purchase. European lands are extensive; the domain of l'Enfile has an area of 120,000 hectares, 1,700 French proprietors own 554,000 hectares, 1,500 Italians own 60,000 hectares.

Agriculture.—Tunisia has 2,859,000 hectares of cultivable land, of which 1,371,000 hectares are planted to cereals. The returns are generally poor, and variable from year to year, especially in the hands of the natives. The crops are hard wheat (540,000 hectares and 1,800,000 quintals), barley (450,000 hectares and 1,500,000 quintals), soft wheat (51,000 hectares and 400,000 quintals), oats (54,000 hectares and 395,000 quintals), maize and sorghum (17,000 hectares and 58,000 quintals); beans occupy 27,000 hectares and give 185,000 quintals. The vine is essentially a European production; it covers 28,000 hectares, of which 15,000 belong to Italians; the principal vineyards are in the regions of Tunis, of Grombalia and of Suk-el-Arba; the production averages 700,000 hectolitres. Tunisia, especially in its eastern part, is very suitable for olive-growing; there are 16 millions of trees, ten millions of which are in full bearing; the three principal districts are those of Cap Bon (1,500,000 trees), Susa (three millions) and Sfax (two millions). One of the greatest achievements of French colonization of Tunisia is the reconstruction of a great olive forest in the region of Sfax. Fine olive yards reach to the extreme south, at Gerba (400,000 trees) and at Zarzis (500,000). The average production of fruit and oil is about 300,000 quintals, with great variations (150,000 quintals in 1917, 450,000 in 1920). The orange (68,000 trees) is grown chiefly in the region of Cap Bon, early vegetables in the neighbourhood of Tunis. The oases provide 1,200,000 date-palms.

Cattle-rearing and Natural Products.—Cattle-rearing and crop-growing are both carried on extensively rather than intensively, with arable, fallow and stubble pasture. There are considerable variations, both in stock and crops. On an average, Tunisia raises 350,000 oxen, 80,000 horses, 30,000 mules, 167,000 asses, 100,000 camels, 15,000 pigs, 1,500,000 sheep, 1,000,000 goats. Transhumance is practised in the rearing of sheep, but in Tunisia the journeys of the nomads are shorter than in Algeria; 50,000 sheep are exported annually and 6,000 quintals of wool.

The principal product of the forests is cork (35,000 quintals). Alfa (100,000 tons) is exported chiefly to England, for the manufacture of paper-pulp. Sea-fishing is carried on in Tunisia under more favourable conditions than in Algeria. The continental plateau is of wider extent, the lakes of Bizerta, of Tunis, of Biban, form natural nurseries, and the fish are more varied in kind. There are 15,000 fishermen, of whom 10,000 are natives and 4,000 Italians. Sponge fishing is carried on along the whole of the east coast, from Monastir to the frontier of Tripoli, especially at Sfax and in the Kerkennah islands; the production of sponge fishing reaches 160,000 kilogrammes.

Mines.—Tunisia possesses practically inexhaustible deposits of phosphates. The chief exploitation is carried on in the Gafra region (Metlaoui, Aïn, Moularès, Redeyef), from which two railway lines run to the ports of Sfax and Susa; two other deposits, those of Meheri Zebbeus and Moilla, are in course of organization. The phosphates of Kalaá-es-Senan and Kalaá-Djerda, found as a prolongation of those of Tebessa, are exported through Tunis. The Tunisian production exceeds 2,500,000 tons; that of the whole world is eight million tons. Iron ores, abundant and of good quality, are found, especially to the south of Kef and not far from the Algerian frontier, at Jebels Slata, Djerissa, Hameïma; to the north of Kef, at Nebeur, and at the Nefzas in Kroumirie. The production exceeds 500,000 tons. Tunisia is thus an important mining region.

Zinc (12,000 tons), and lead (40,000 tons) come from Khanguet-Kef-Tout, between Bija and Tabarka, from Zaghouan and Jebel Ressas. Apart from the somewhat poor lignites of Cap Bon, no fuel minerals have been found up to the present; petrol has been sought at Slougonia and at Medjez-el-Bab. The minerals are exported in the raw state, and the only important industries are those dependent upon agriculture, flour-milling, oil-refining, distilling. Thermal and mineral springs are numerous.

Communications.—Tunisia possesses 5,180 km. of roads, of large and medium size, and 2,000 km. of railway lines. The line from Medjerda, built before the French protectorate, is a trunk line of Central North Africa and links Algeria with Tunis; two branches diverge to the north towards Bizerta; they reunite at Mateur, from which a line runs to Tabarka; in the south, a line reaches Nebeur. From Tunis a line runs parallel to the east coast, passing through Susa, Sfaz and Gabes; three lines linking the interior with the sea join this coastal one, the lines Tunis-Kalaá-es-Senan, Susa-Henaghir-Souatir, Sfax-Gafsa, with branches to Tozeur and Metlaoni. The law of April 6, 1902, gave Tunisia the control of its railways; they are managed by two companies, the leaseholding company of the Tunisian railways and the Sfax-Gafsa company. The Medjerda and Bizerta lines are broad gauge (1·44m.), the other lines narrow gauge (1·055m.).

The four ports of Bizerta, Tunis, Susa and Sfax are very well equipped, the other ports being of only secondary importance. Of a tonnage of 3,900,000 tons, Tunis takes 1,700,000, Sfax 1,300,000, Susa 390,000 and Bizerta 250,000. The French warehouse stores 900,000 tons.

Trade.—For a certain number of products, notably cereals, Tunisia, France and Algeria are under one customs union. For other products, notably wines, Tunisia is under a contingent *régime*, that is to say, its products are allowed free into the metropolis in quantities determined each year. On the other hand, French goods receive privileged treatment in Tunisia. The trade of Tunisia in 1927 rose to 2,798 million fr. (imports 1,772 millions, exports 1,026 millions). The share of France was 1,378 millions (imports 999 millions, 56%, exports 383 millions, 37%); that of Algeria 215 millions; that of Great Britain 122 millions (imports 51 millions, especially cotton goods and coal; exports 61 millions, especially alfa, phosphates and iron ore); that of Italy 360 millions.

Tunisia imports manufactured articles, particularly cotton goods, colonial produce, sugar, tea, coffee, machines (especially motor-cars), coal and petrol. She exports cereals (37 million fr., 81,000 quintals of wheat, 100,000 of barley, 40,000 of oats), olive oil (269 million fr., 245,000 quintals), sheep (two million fr., 14,000 head), wine (65 million fr., 327,000 hectolitres), alfa (54 million fr., 84,000 tons), fishery products (20 million fr., of which 14 lion are sponges), phosphates (201 million fr., 2,956,000 to iron ores (60 million fr., 992,000 tons), lead (12 million fr., 9 tons), zinc (17 million fr., 36,000 tons).

HISTORY

The history of Tunisia begins with the establishment of Phoenician colonies (*see* PHOENICIA and CARTHAGE). The P settlers semitized the coast, but left the Berbers of the inte almost untouched. The Romans entered into the heritage of Carthaginians and the vassal kings of Numidia, and Punic sp and civilization gave way to Latin, a change which from the of Caesar was helped on by Italian colonization; to this re the Romans gave the name of "Africa," apparently a latini of the Berber terms "Ifriqa," "Ifrigia" (in modern Ar *Ifriqiyah*).

Rich in corn, in herds, and in later times also in oil, and pos ing valuable fisheries, mines and quarries, the province of Af of which Tunisia was the most important part, attained u the empire a prosperity to which Roman remains in all p of the country still bear witness. Carthage was the second of the Latin part of the empire, "after Rome the busiest and haps the most corrupt city of the West, and the chief centr Latin culture and letters." In the early history of Latin C tianity Africa holds a more important place than Italy. It here that Christian Latin literature took its rise, and to province belong the names of Tertullian and Cyprian, of A bius and Lactantius, above all of Augustine. Lost to Rome the invasion of the Vandals, who took Carthage in 439, the vince was recovered by Belisarius a century later (533–534), remained Roman till the Arab invasions of 648–669. The queror, 'Oqba-bin-Nafa, founded the city of Kairwan (which was the residence of the governors of "Ifriqiyah" u the Omayyads and thereafter the capital of the Aghlabite prin the conquerors of Sicily, who ruled in merely nominal depend on the Abbasids.

Arab and Berber Dynasties.—The Latin element in A and the Christian faith almost disappeared in a single generat the Berbers of the mountains, who had never been latinized never really christianized, accepted Islam without difficulty, showed their stubborn nationality, not only in the characte their Mohammedanism, which has always been mixed with worship of living as well as dead saints (marabouts) and o peculiarities, but also in political movements. The empire of Fātimites (*q.v.*) rested on Berber support, and from that forth till the advent of the Turks the dynasties of North A were really native, even when they claimed descent from s illustrious Arab stock. When the seat of the Fātimite em was removed to Egypt, the Zirites, a house of the San Berbers, ruled as their lieutenants at Mahdia, and about Mo'izz the Zirite, in connection with a religious movement aga the Shi'ites, transferred his very nominal allegiance to the basid caliphs. The Fātimites in revenge let loose upon A about A.D. 1045 a vast horde of Bedouins from Upper E (Beni Hilāl and Solaim), the ancestors of the modern no of Barbary. All North Africa was ravaged by the invaders, though unable to found an empire or overthrow the se

ernment in the towns, forced the agricultural Berbers into the ountains, and, retaining from generation to generation their less and predatory habits, made order and prosperity almost ossible in the open parts of the country until its effective upation by the French. The Zirite dynasty was finally ex-tinguished by Roger I. of Sicily, who took Mahdia in 1148 and ablished his authority over all the Tunisian coast. Even slim historians speak favourably of the Norman rule in Africa; it was brought to an early end by the Almohade caliph Abd-lumin, who took Mahdia in 1160.

The Almohade Empire soon began to decay, and in 1336 Abū arīyā, prince of Tunis, was able to proclaim himself inde-dent and found a dynasty, which subsisted till the advent of Turks. The Hafsites (so called from Abū Ḥafs, the ancestor Abū Zakarīyā, a Berber chieftain who had been one of the mate disciples of the Almohade mahdi) assumed the title of ice of the Faithful, a dignity which was acknowledged even Mecca, when in the days of Mostanṣir, the second Hafsite, fall of Bagdad left Islam without a titular head. In its best s the empire of the Hafsites extended from Tlemçen to Trip- and they received homage from the Merinids of Fez; they l their own against repeated Frankish invasions, of which most notable were that which cost St. Louis of France his (1270), and that of the duke of Bourbon (1390), when Eng- troops took part in the unsuccessful siege of Mahdia. They rned Tunis with mosques, schools and other institutions, oured letters, and in general appear to have risen above the al level of Muslim sovereigns. But their rule was troubled continual wars and insurrections; the support of the Beduin os was imperfectly secured by pensions which formed a heavy den on the finances of the state; and in later times the asty was weakened by family dissensions. Leo Africanus, ing early in the 16th century, gives a favourable picture of "great city" of Tunis, which had a flourishing manufacture ne cloth, a prosperous colony of Christian traders, and, in-ing the suburbs, nine or ten thousand hearths.

urkish Conquest.—The conquest of Algiers by the Turks a dangerous neighbour to Tunisia, and after the death of ammed the Hafsite in 1525 a disputed succession supplied irad-Dīn Barbarossa with a pretext for occupying the city e name of the sultan of Constantinople. Al-Ḥasan, the son of ammed, sought help from the emperor, and was restored in as a Spanish vassal, by a force which Charles V. commanded erson, while Andrea Doria was admiral of the fleet. But the uest was far from complete, and was never consolidated. Spaniards remained at Goletta and made it a strong fortress, also occupied the island of Jerba and some points on the n-east coast; but the interior was a prey to anarchy and civil until in 1570 'Alī-Pasha of Algiers utterly defeated Ḥāmid, on and successor of Al-Ḥasan and occupied Tunis. In 1573 Turks again retreated on the approach of Don Juan, who had ns of making himself king of Tunis; but this success was not wed up, and in the next year Sultan Selim II. sent a strong dition which drove the Spaniards from Tunis and Goletta, reduced the country to a Turkish province. Nevertheless the ish occupation left a deep impression on the coast of Tunis, ot a few Spanish words passed into Tunisian Arabic.

ter the Turkish conquest, the civil administration was placed r a pasha; but in a few years a military revolution trans-d the supreme power to a Dey elected by the janissaries, formed the army of occupation. The government of the lasted till 1705, but was soon narrowed or overshadowed he authority of the Beys, whose proper function was to ge the tribes and collect tribute. From 1631 to 1702 the of Bey was hereditary in the descendants of Murād, a Cor- renegade, and their rivalry with the Deys and internal dis-ons kept the country in constant disorder. Ibrahīm, the last e Deys (1702–05), destroyed the house of Murād, and ab-d the beyship in his own office; but, when he fell in battle the Algerians, Ḥussein b. 'Alī, the son of a Cretan renegade, proclaimed sovereign by the troops under the title of "Bey," being a prince of energy and ability, was able to establish the hereditary sovereignty, which has lasted without change of dynasty to the present time.

A Pirate State.—Frequent wars with Algiers form the chief incidents in the internal history of Tunisia under the Beys. Under Deys and Beys alike Tunisia was essentially a pirate state. Occasionally acts of chastisement, of which the bombardment of Porto Farina by Blake in 1655 was the most notable, and repeated treaties, extorted by European powers, checked from time to time, but did not put an end to, the habitual piracies, on which indeed the public revenue of Tunis was mainly dependent. The powers were generally less concerned for the captives than for the acquisition of trading privileges, and the Beys took advantage of the commercial rivalry of England and France to play off the one power against the other. The release of all Christian slaves was not effected till after the bombardment of Algiers; and the definite abandonment of piracy may be dated from the presentation to the Bey in 1819 of a collective note of the powers assembled at Aix-la-Chapelle. The government had not elasticity enough to adapt itself to so profound a change in its ancient traditions; the finances became more and more hopelessly embarrassed, in spite of ruinous taxation; and attempts at European innovations in the court and army made matters only worse, so long as no attempt was made to improve the internal condition of the country. In the third quarter of the 19th century not more than a tenth part of the fertile land was under cultivation, and the yearly charge on the public debt exceeded the whole annual revenue. In these circumstances only the rivalry of the European powers that had interests in Tunisia protracted from year to year the inevitable revolution. The French began to regard the dominions of the Bey as a natural adjunct to Algeria, but after the Crimean War Turkish rights over the regency of Tunis were revived. After the Franco-German War the embarrassed Bey turned towards Great Britain for advice, and a British protectorate—suggested by the proximity of Malta—was not an impossibility under the remarkable influence of the celebrated Sir Richard Wood, British diplomatic agent at the court of Tunis from 1855 to 1879. The railways, lighthouses, gas and waterworks and other concessions and industries were placed in British hands. But in 1878, at the Congress of Berlin, Lord Salisbury agreed to allow France a "free hand" in Tunisia in return for French acquiescence in the British lease of Cyprus.

FRENCH OCCUPATION

After 1862, however, the kingdom of Italy began to take a deep interest in the future of Tunisia. When the country went bankrupt in 1869, a triple control was established over Tunisian finances, with British, French and Italian "controllers." In 1880 the Italians bought the British railway from Tunis to Goletta. This and other actions excited the French to act on the secret understanding effected with the British foreign minister at the Berlin Congress. In 1881 a French force crossed the Algerian frontier under pretext of chastising the independent Khmir or Kroumir tribes on the north-east of the regency, and, quickly dropping the mask, advanced on the capital and compelled the Bey to accept the French protectorate. The actual conquest of the country was not effected without a serious struggle with Muslim fanaticism, especially at Sfax; but all Tunisia was brought completely under French control, military posts being placed at every important point. (H. H. J.)

Muhammed VI., the reigning Bey, signed the treaty acknowledging a French protectorate at his summer residence, the Bardo palace, on May 12, 1881. He died in Oct. 1882, and a new treaty, that of La Marsa (June 8, 1883) was signed by his brother and successor, Ali IV. A resident general was appointed by France, and he also became foreign minister of the Regency. From 1884 onward the French carried out a thorough reform of the administration. The native government was retained, but the majority of the ministers were Frenchmen. The resources of the country were steadily developed, order was maintained, native laws and customs were respected and Tunisia was much benefited. Great Britain, as was to be anticipated, early recognized the protectorate, as did most of the other Powers. Turkey did not, and though by 1892

she so far acknowledged the *de facto* situation as to consent to define, partially, the Tunisian-Tripolitanian frontier, it was not until 1920, by the treaty of Sèvres, that Turkish claims to the Regency were finally renounced. Italy, however, was in fact more deeply concerned than were the Turks by the establishment of the French protectorate. In Tunisia her interests were not merely geographical and political. Italians formed by far the largest European colony, and Italy had hoped to secure the Regency for herself. It was not until 1896 that Italy formally acknowledged the protectorate, and by the terms of a convention then concluded the right of Italians in Tunisia to maintain their nationality was guaranteed. British subjects had the same right; this affected chiefly the large number of Maltese settled in the country. The persistence shown by Italians and Maltese in maintaining their nationality was a cause of annoyance to the French, and of some practical inconvenience. As part of an effort to give the protectorate a more French character decrees were issued in 1921 declaring that British and Italian subjects, born of parents who were themselves born in Tunisia, would be deemed to be of French nationality. These decrees provoked resentment, especially among the Italians. As to the British (*i.e.*, Maltese) an arrangement was reached with France in 1923 whereby the persons affected were entitled to decline French nationality. With Italy no settlement had been reached up to 1929—the convention of 1896 being still in force.

The nomad tribes in the South gave occasional trouble, but French rule was generally accepted. During the World War tribesmen from Fezzan, led by Turkish officers, attacked the French outposts in southern Tunisia. There was some sharp fighting in Sept. and Oct. 1915, when the French re-established order. Later on large numbers of Tunisian soldiers were employed in France. In 1919–20 by agreement with Italy the territory south of Tunisia forming salients between the oases of Ghadames and Ghat and between Ghat and Tummo was transferred by France to Italy.

In northern Tunisia, where agriculture and industry flourished, there was some assimilation by the Tunisians of Western thought, and a generation arose which, not having experienced the misrule existing before the French occupation, sought larger political rights. In 1922, to meet the desire of the Tunisians for a share in the administration, a general council for the protectorate—consisting of 44 French and 18 nominated native representatives—and regional councils, were established. The general council superseded a consulting conference set up in 1905, and had wider powers than that body. There had already arisen a nationalist agitation, and this in 1924–25, when the cost of living was four times as great as in 1914, was mixed up with a Communist agitation, accompanied by some disturbances in the towns. The Communist agitation was not deep rooted, but among educated Tunisians there was a demand for a democratic form of government. This demand was not met, but as an educational measure further powers were conferred in 1925 on municipal councils.

TUNNEL, a more or less horizontal underground passage made without removing the overlying rock or soil. In former times any long tube-like passage, however constructed, was called a tunnel. In 1928 the word was sometimes popularly applied to an underground passage constructed by trenching down from the surface, building the arching or other form of structure and then refilling over the top with soil; but a passage so constructed, although indistinguishable from a tunnel when completed, is more correctly termed an "aqueduct," a "covered way" or "subway" (depending on its use) and the operations "cutting" and "covering," instead of tunnelling. Making a small tunnel, afterwards to be converted into a larger one, is called driving a heading, and in mining operations small tunnels are termed galleries, drifts and adits. If the passage leading underground is vertical it is called a shaft; if inclined from the vertical it is called a slope, or inclined shaft; if the shaft or slope is begun at the surface the operations are known as sinking; and if worked upwards from a previ constructed heading or gallery the operations are called risin stopes. (*See* COAL AND COAL MINING; MINING, METALLIFER

Tunnels may be driven through earth, which usually req timbering during excavation (and there are many system timbering) or the use of a shield; or in rock, which may or not require timbering, depending on the firmness. (*See* Plate, 2 and 3.) In earth, and often in rock some form of perma lining is necessary and it is sometimes formed of closely sp heavy timbers but more often of some type of masonry. Tu may be excavated either above or below water level, and i former case excavated in free air, but, in the latter, where in e modern practice usually requires the use of compressed air.

Tunnelling has been effected by natural forces to a far gr extent than by man. In limestone districts innumerable swa holes, or shafts, have been created by sinking rain water fo ing joints and dissolving the rock, and from the bottom of shafts tunnels have been made by the water to the sides of in a manner strictly analogous to the ordinary method of exec a tunnel by sinking shafts at intervals and driving headings t from. Many rivers thus find a course underground. In Minor one of the rivers on the route of the Mersina rai extension pierces a hill by means of a natural tunnel. The M moth Cave of Kentucky, the caverns at Carlsbad, New Me and the Peak caves of Derbyshire are due to natural tunnelli

Mineral springs bring up vast quantities of matter in solu It has been estimated that the Old Well spring at Bath has charged since the beginning of the 19th century solids equiv to the excavation of a 6 ft. by 3 ft. heading, 9 m. long; an the water is perfectly clear and the daily flow is only the part of that pumped out of the great railway tunnel unde Severn. Tunnelling is also carried on to an enormous exte the action of the sea.

Subaqueous Demolitions.—The most gigantic subaq demolition hitherto carried out by man was the blowing 1885 of Flood rock, a mass about 9 ac. in extent, near Island sound, N.Y. To effect this gigantic work by a sing stantaneous blast a shaft was sunk 64 ft. below sea-level, the bottom of which 4 m. of tunnels or galleries were driv as completely to honeycomb the rock. The roof rock ranged 10 to 24 ft. in thickness, and was supported by 467 pillars square; 13,286 holes, averaging 9 ft. in length and 3 i diameter, were drilled in the pillars and roof. About 80,00 yd. of rock were excavated in the galleries and 275,000 rem to be blasted away. The holes were charged with 110 to "rackarock," a more powerful explosive than gunpowder, was fired by electricity. The sea was lifted 100 ft. over the area of the rock.

Early Examples of Tunnelling.—With so many exampl natural caves and tunnels in existence it is not to be won at that tunnelling was one of the earliest works undertake man, first for dwellings and tombs, then for quarrying and m and finally for water-supply, drainage and other requiremen civilization. A Theban king on ascending the throne bega once to drive the tunnel which was to form his final resting p and persevered with the work until death. The tomb of Min at Thebes, was driven at a slope for a distance of 350 ft. int hill, when a shaft was sunk and the tunnel projected a fa length of about 300 ft., and enlarged into a chamber fo sarcophagus. Tunnelling on a large scale was also carried the rock temples of Nubia and of India and to some extent b Aztecs in America, and the architectural features of the entra to some of these temples might be studied with advantage b designers of modern tunnel portals.

Flinders Petrie has traced the method of underground qu ing followed by the Egyptians opposite the Pyramids. Pa galleries about 20 ft. square were driven into the rock and galleries cut, so that a hall 300 to 400 ft. wide was formed, a roof supported by rows of pillars 20 ft. square and 20 ft. a Blocks of stone were removed by the workmen cutting gr all round them, and, where the stone was not required for but merely had to be removed to form a gallery, the grooves

: enough for a man to stand up in. Where granite, diorite other hard stone had to be cut the work was done by tube s and by saws supplied with corundum, or other hard gritty erial, and water—the drills leaving a core of rock exactly like of the modern diamond drill.

s instances of ancient tunnels through soft ground and requir- masonry arching, reference may be made to the vaulted drain r the south-east palace of Nimrod and to the brick arched el, 12 ft. high and 15 ft. wide, under the Euphrates. In ria, Switzerland and wherever the Romans went, remains of els for roads, drains and water-supply are found. Pliny s to the tunnel constructed for the drainage of Lake Fucino he greatest public work of the time. It was then by far the est tunnel in the world, being more than 3·5 m. in length, and driven under Monte Salviano, which necessitated shafts no than 400 ft. in depth. Forty shafts and a number of cuniculi, nclined galleries, were sunk and the excavated material was n up in copper pails, of about 10 gal. capacity, by windlasses. tunnel was designed to be 10 ft. high by 6 ft. wide, but its

al cross-section varied. It is stated that 30,000 labourers were pied 11 years in its construction. With modern appliances a small percentage of the men, such a tunnel could be driven 1 the two ends without intermediate shafts in far less time.

o practical advance was made on the tunnelling methods of Romans until gunpowder came into use. Old engravings of ng operations early in the 17th century show that excavation still accomplished by pickaxes or hammer and chisel, and that d fires were lighted at the ends of the headings to split and en the rock in advance. (*See* fig. 1.) Crude methods of venti- n by shaking cloths in the headings and by placing inclined boards at the top of the shafts are also on record. Before the advent of the railroad, tunnels were built for canals at many locations and some were of very early date. On the introduction of railways tunnelling became one of the ordinary incidents of a contractor's work. Probably upwards of 4,000 railway tunnels have been excavated, including in this list some of the longest tunnels in the world, such as the Mont Cenis, Saint Gotthard, Simplon and Loetschberg in the Alps; the Hoosac, Moffat and Cascade in mountains of the United States; and the Connaught at Rogers pass in Canada. On mountain railways, tunnels often form a large percentage of the length; on the Mexican railway in a distance of 66 m. there are 21 tunnels; on the Southern Pacific 11 tunnels in 25 m., including a spiral tunnel. There are also several long spiral tunnels on the Canadian Pacific railway at the Kicking Horse pass. The longest single tunnel, however, is the Shandaken tunnel, 18·1 m. in length, built by the City of New York (1917–24) as an extension of the Catskill aqueduct system for water-supply, in Greene county, N.Y.

TUNNELLING UNDER RIVERS AND HARBOURS

Through Tunnelling Methods.—In 1818 Marc Isambard Brunel took out a patent for a tunnelling process, which included a shield, and which mentioned cast iron as a surrounding wall. His shield foreshadowed the modern shield, which is substituted for the ordinary timber work of the tunnel, holds up the surrounding earth during excavation, affords space within its shelter for building the permanent lining, overlaps this lining in telescope fashion and is moved forward by pushing against the front ends. The advantages of cast iron lining are that it has great strength in small space as soon as the segments are bolted together, and its joints can be caulked water-tight.

First Use of Shield.—In 1825, Brunel began, and completed in 1843, after several suspensions of operations, the Thames tunnel between Rotherhithe and Wapping. It was constructed for a highway, but was never used for that purpose. It was sold in 1866 to and has since been used by the East London railway, which operates its trains through it. This early tunnel, built of brick, in the form of two arches with frequent openings between them, has a length of 1,200 ft., and required an excavation opening 27 ft. in width, which is still one of the widest ever built under such conditions. Brunel employed a peculiar form of shield, made of timber, in several independent sections. Part of the ground penetrated was almost liquid mud, and the cost of the tunnel was about £433 per linear foot. In 1830 Lord Cochrane (afterwards the 10th earl of Dundonald) patented the use of compressed air for shaft sinking and tunnelling in water-bearing strata. Water under any pressure can be kept out of a subaqueous chamber or tunnel by introducing sufficient air of a greater pressure, and men can breathe and work therein—for a time—up to a pressure exceeding four atmospheres. To confine the compressed air it is necessary to provide a substantial bulkhead across the workings. To pass men and materials through the bulkhead there is a mechanical device called a lock, which is a large steel tube, with doors at each end, both of which open inward toward the working chamber, and both of which can never be opened at one time because of the difference in air pressure between that in the working chamber and that back of the bulkhead. Valves are provided to admit compressed air to the lock from the working chamber, and also to exhaust it from the lock to back of the bulkhead, in order to manipulate the doors.

The Severn tunnel 4·33 m. in length, for a double line of railway, was begun in 1873 and finished in 1886. Hawkshaw, Son and Hayter were the engineers, and T. A. Walker the contractor. At the lowest part the depth of water was 59 ft. at low water and 104 ft. at high water, and the thickness of sandstone over the brickwork was 45 feet. Under a depression in the bed of the river on the English side there is a cover of only 30 ft. of marl. Much water was met with throughout. In 1879 the works were flooded for months by a land spring on the Welsh side of the river, and on another occasion from a hole in the river bed at the Salmon pool. This hole was filled with clay and the work completed beneath. The total amount of water raised

at all the pumping stations was about 27,000,000 gal. in 24 hours.

The length of the railway tunnel under the Mersey between Liverpool and Birkenhead, is 1 m. between the pumping shafts on each side of the river. From each a drainage heading was driven through the sandstone with a rising gradient towards the centre of the river. This heading was partly bored out by a Beaumont machine to a diameter of 7 ft. 4 in. and at a rate attaining occasionally 195 ft. per week. All of the tunnel excavation, amounting to 320,000 cu.yd., was done by hand labour, as heavy blasting would have shaken the rock. The minimum cover is 30 ft. between the top of the arch and the bed of the river. Pumping machinery is provided for 27,000,000 gal. per day, which is more than double the usual quantity of water. Messrs. Brunlees and Fox were the engineers and Messrs. Waddell the contractors for the work which, taking six years, was completed in 1886.

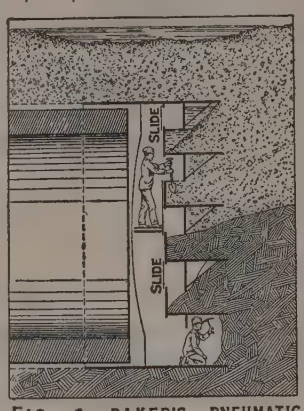

FIG. 2.—BAKER'S PNEUMATIC SHIELD

Some 30 m. of brick-lined waterworks tunnels have been built under the Great Lakes since 1864, mostly in clay, without the use of shields, although in the later ones compressed air was utilized. A large portion of one of the tunnels at Cleveland, O., 9 ft. interior diameter, was built at the rate of 17 ft. per day at a cost of about $18 per foot. During this work three explosions of inflammable gases occurred in which 19 men were killed and others were injured. Later a fire at the shaft in the lake caused the death of ten men. Work was thereafter completed under the direction of George H. Benzenberg. Less serious accidents, principally explosions of marsh gas, occurred in many of the other tunnels.

In 1869 P. W. Barlow and J. G. Greathead built the Tower footway under the Thames, using for the first time a cast iron lining and a shield which embodied features of Brunel's design.

First Tunnel in Compressed Air.—Compressed air was first used in tunnel work by Hersent, at Antwerp in 1879, in a small drift with cast iron lining. In the same year compressed air was used for the first time in any important tunnel by D. C. Haskin, in the famous first Hudson River tunnel, from Hoboken, N.J., to Morton street, New York city. This tunnel was to be of two tubes, each 16 ft. wide by 18 ft. high. In June 1880 the northerly tube had reached 360 ft. from the Hoboken shaft. The compressed air blew a hole through the soft silt of the roof at this spot, and the water entering drowned the 20 men. With British capital and largely under the direction of British engineers (Sir Benjamin Baker and E. W. Moir), the northerly tunnel was extended 2,000 ft. to about three-fourths of the way across but in 1891, the tunnel was allowed to fill with water and it so remained for ten years. Both tubes were completed in 1908, under the direction of Charles M. Jacobs, engineer. In the meantime, two others were started crossing under the Hudson from beneath the Pennsylvania railroad station in Jersey City to Cortlandt street, New York, and connecting tubes on the New Jersey side paralleling the Hudson river. These tunnels which form parts of the Hudson and Manhattan railroad system, were put in operation in 1910 under electric traction by third rail. (*See* TRACTION, ELECTRIC.)

The use of compressed air in the first Hudson tunnel, and of annular shields and cast iron lining in constructing the City and South London railway (1886–90) by Greathead, became widely known and greatly influenced subaqueous and soft-ground tunnelling thereafter. The pair of tunnels for this railway, from near the monument to Stockwell, from 10 ft. 2 in. to 10 ft. 6 in. interior diameter, were constructed mostly in clay and without the use of compressed air, except for a comparatively short distance through water-bearing gravel. In this gravel a timber heading was made, through which the shield was pushed. The reported total cost was £840,000. Other tunnels, lined with ca iron segments and constructed by means of annular shields the use of compressed air, were constructed after the City South London work was well advanced.

The St. Clair River tunnel (Joseph Hobson, engineer) fr Sarnia to Port Huron, Mich., was built in 1889–90, through cl and for a short distance through water-bearing gravel. It 1·14 m. in length and 21 ft. external diameter. This tunnel the first one completed in America in which were used all essential elements for successful subaqueous work; *i.e.*, a shi compressed air and cast-iron rings.

In 1890–93 a shield-driven vehicular tunnel was construc in sand and gravel across the Clyde in Glasgow, Scotland. consists of three parallel cast iron tubes with an internal diame of 16 ft., the centre one being a footway and the outer tubes vehicles in each direction. The footway is reached by incli ramps and stairs, but the vehicles are lowered and raised elevators in shafts of 76 ft. inside and 80 ft. outside diame The distance between shafts is 700 feet. The cost was £287,0 This tunnel was not a financial success because of competition a municipal ferry and its use, though interrupted, was resum

In 1891 the tunnel of the Ravenswood Gas Co. in New Y city was started by Jacobs and Davies, engineers, crossing neath the East River and Blackwell's island from between 7 and 71st streets in Manhattan, to Ravenswood in Long Isl city. It was expected to be a rock tunnel throughout and section was to be 8 ft. 6 in. high and 10 ft. 6 in. wide, to pro room for two 3 ft. and one 4 ft. gas mains. Soft ground encountered and great difficulty was found because of the de and water pressure. Compressed air was adopted, the press at times reaching as high as 46 lb. per square inch. Eventua it was necessary to line the soft ground sections with cast i rings of 10 ft. 2 in. internal diameter. The work was comple in 1894.

The notable Blackwall tunnel, under the Thames about 6 below London bridge (Sir Alexander Binnie, engineer, and Pearson and Sons, contractors), was built in 1892–97, through and 400 ft. of water-saturated gravel. The tunnel is about 3 ft. long, the external diameter 27 ft. and the internal diameter ft. 3 inches. The shield, 19 ft. 6 in. long, contained a bulkh with movable shutters, as foreshadowed in Baker's propo shield (fig. 2). There are a roadway 16 ft. wide for vehicles two footwalks 3 ft. wide. The maximum grade is 2·78%.

Numerous tunnels of small diameter have been constructed the use of shields under the Thames and Clyde for electric cable ways, several for sewers in Melbourne and under the S at Paris for sewer siphons.

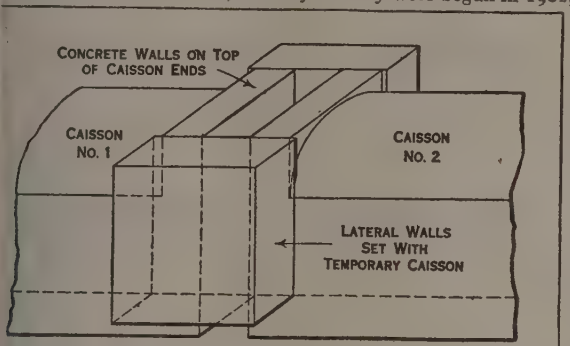
The Rotherhite tunnel, under the Thames, about 2·25 m. b London bridge, provides for a vehicular roadway 16 ft. wide two footwalks 4 ft. 8 in. wide. It has a length of 4,863 ft. tween portals, of which about 1,400 ft. are directly under the ri The exterior diameter of the tunnel is 30 ft. and the interio feet. The maximum grade is 2·7%. It is constructed of cast rings and concrete lining, and a shield and compressed air used. It was begun in 1904 and finished in 1908. Maurice maurice was the engineer of design and construction, and and Reeves the contractors. The top of the main tunnel e vation in the middle of the river was only 7 ft. from the bed of Thames, and a temporary blanket of filled earth, usual in sim cases, was prohibited owing to the close proximity of the do

The East Boston tunnel, built in 1901, was the first impor example of a shield-built monolithic concrete arch, and ext from the Boston subway to East Boston. It is 1·4 m. long, 3 ft. being under the harbour. One mile was excavated by tun ling with roof shields about 29 ft. wide, through clay contai pockets of sand and gravel. The shields reacted against iron set in the concrete and moved forward on the masonry side w The engineer was H. A. Carson, and the contractors the Bo Tunnel Construction Company and Patrick McGovern.

A number of tunnels of marked importance, of the subaqu shield-driven type, operated solely with electric cars (*see* T TION, ELECTRIC) in addition to the Hudson and Manhattan

already mentioned, have been built under the East and Hud- rivers at New York. They are divided into two groups: e built as parts of the Pennsylvania-Long Island railroad sys- s, and those forming parts of the rapid transit system built by City of New York.

If the rapid transit tunnels, the first two tubes, of 15 ft. 6 in. rior diameter and 4,150 ft. long, penetrate gneiss, sand and el directly under the East river, between the Battery, in Man- an, and Joralemon street, Brooklyn. They were begun in 1902,



. 3.—PERSPECTIVE SHOWING MANNER OF ENCLOSING SPACE BETWEEN NNEL CAISSONS FOR THE MÉTROPOLITAIN UNDER THE SEINE AT PARIS

Wm. Barclay Parsons (and later George S. Rice) as chief neer, and were finished in Dec. 1907, under the direction of ton I. Aims and D. L. Hough of the New York Tunnel Com- , contractors. Two other tubes, also of the same size, built through gneiss, sand and gravel) between 1905 and 1907 by Degnon Contracting Company, with R. A. Shailer as the con- ors' engineer, extend from 42nd street, Manhattan, to Long nd City. These tubes were built as an independent line, but bought and merged with the rapid transit system, under the ating contracts of 1913. Under these contracts four other els each consisting of two tubes, were also driven beneath the river: from Whitehall street, Manhattan, to Montague street, klyn; Old Slip, Manhattan, to Clark street, Brooklyn; 14th t, Manhattan, to North 7th street, Brooklyn; and from 60th t, Manhattan, to Long Island city. They are of larger

At the 60th and 14th street tunnels the tubes in part above the original river bed and were built in an artificial but manent bed of clay protected by rip-rap of stone. On both the lemon and Whitehall street tunnels blow-outs of compressed occurred during construction which carried workmen through he river surface, and in each case one man survived without y. (*See* Plate, fig. 6.) The chief engineer for the city was ed Craven, and, later, Daniel L. Turner. The work was done een 1914–20. Under contracts let by the city for a proposed pendent rapid transit system for municipal operation (Robert way, chief engineer for the board of transportation, City of York), two other tube tunnels are in process of construc- (1928) under the East river: Fulton street, Manhattan, to berry street, Brooklyn; and Fifty-third street, Manhattan, ong Island City. The 53rd street tunnel is also being built in in an artificial river bottom of clay filling. A tunnel is also g built under the Harlem river, from Manhattan to the Bronx, 45th street. The greatest shield progress, that on the White- Montague street tunnel, was 95 ft. in a week of six working . A pressure of 48 lb. was used in the 60th street tunnel. our somewhat larger tubes, measuring 23 ft. on the outside eter were built under the East river in 1904–09 for the Penn- ania and Long Island railroads. Alfred Noble was chief en- er, S. Pearson and Son, contractors, and E. W. Moir was ral manager for the contractors. Blowouts were prevented placing clay blankets (sometimes 25 ft. thick) on the river which could be carried up to 20 ft. depth of water in the and back of the pierhead lines, and by filling the pores e sand and gravel at the face of the shield with dry blue lias or applying plastic clay. Under the Hudson river, two tubes of the same size as those under the East river were built for the Pennsylvania trains to New Jersey.

In 1914 a highway tunnel, started in 1907 and very similar to that at Glasgow, was completed in sand beneath the Elbe river at Hamburg, Germany. Access is here also obtained by elevators, in shafts 1,471 ft. between centres. The shafts are 72 ft. inside and 84 ft. outside diameter and each contains four elevators for vehicles and two for foot passengers. The lift is 78 feet. Each of the two tubes between shafts provides for a single roadway 6 ft. wide and two foot-walks 4 ft. wide. The tubes are of cast iron 19·7 ft. external diameter and the clear width inside is 14·8 feet. The lining is concrete faced with decorative tiles.

The new (1920) water-supply intake tunnel at Cleveland, O., extends out 2·8 m., below the surface of Lake Erie, at a depth of 95 ft. below the surface and 40 to 50 ft. below the lake bottom. It was driven with a shield and compressed air in soft clay and sand. The air pressure for most of the work varied from 15 to 25 lb. per square inch. The tunnel has an internal diameter of 10 ft. and is lined with concrete blocks 11 in. thick.

The notable Holland tunnels connect Canal street, New York, with Twelfth street, Jersey City, passing beneath the Hudson river. The tunnels are named in honour of Clifford M. Holland, the first chief engineer, who died on Oct. 27, 1924, two days before the meeting of the tubes beneath the river. Mr. Holland was succeeded by Milton H. Freeman and the latter on his death by Ole Singstad. The tunnels consist of two tubes 1·61 m. in length between the portals. Except for the land approaches, they consist of circular cast iron rings, 29 ft. in exterior diameter. They are solely for motor-propelled vehicular traffic and each tube provides for two lines of traffic in one direction only, with a roadway width of 20 feet. The tubes beneath the river were driven with shields under compressed air. (*See* Plate, fig. 3.) The maximum grade, with traffic, is 4% and against traffic, 3·6%, both on the New York side of the river. The roadways are paved with granite blocks, and the clear headroom is 13 ft. 6 inches. The interior

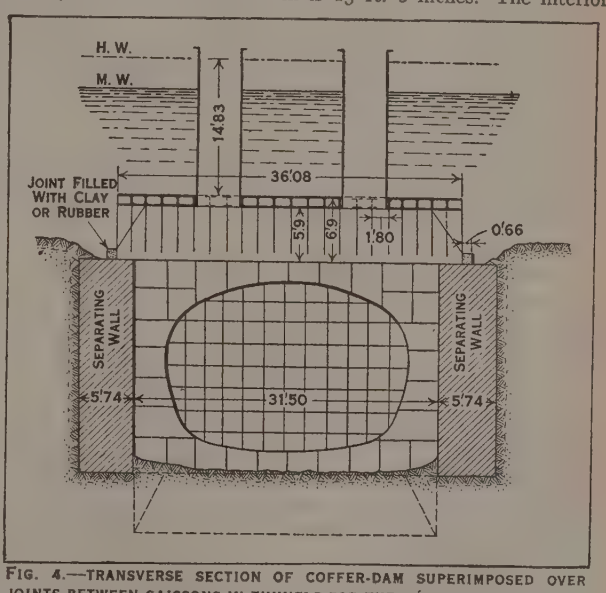


FIG. 4.—TRANSVERSE SECTION OF COFFER-DAM SUPERIMPOSED OVER JOINTS BETWEEN CAISSONS IN TUNNELS FOR THE MÉTROPOLITAIN UNDER THE SEINE

walls are covered with glazed ceramic tile and the tubes are brilliantly lighted by electricity. The entrance and exit portals are separated at each end by two city blocks and large plazas are provided to prevent traffic congestion. Artificial ventilation is provided. The tunnels have fire fighting equipment, water lines, sand boxes, telephones, traffic signals, wrecking equipment, etc. A footwalk is provided for policing and inspection, but the tunnels are not open to pedestrians. Power for the equipment is obtained from two independent sources on each side of the river and three independent cables from each source of supply. Each

cable has a capacity sufficient to carry the full load. It was estimated that the tunnels would have a traffic capacity of 1,900 vehicles per hour for each tube. About 52,000 vehicles have used the tunnels in a single day, without reaching their capacity. Construction began on July 1, 1919, and the tunnels were opened to traffic on Nov. 11, 1927. The cost of construction and real estate was about $48,000,000, of which the States of New York and New Jersey paid equal amounts. Tolls are collected.

The River Mersey vehicular tunnel, between Liverpool and Birkenhead, England, lies about parallel with and a little north of the Mersey railway tunnel, built in 1880–86. It is the largest circular tube tunnel in the world, having an outside diameter of 46 ft. 3 in. and inside diameter of 44 ft. This tunnel is lined with cast iron plates and concrete. The main roadway is at about the centre of the tube and provides for four lines of traffic on a width of 36 ft. and two foot-walks of about 4 ft. each. Over this roadway, with a clearance of 17 ft., is the exhaust air ventilating duct, occupying the top of the tube. Below the main roadway, in the central part of the bottom of the tube, there is a roadway for two lines of traffic, with a width of 21 ft. and clear height of 17 feet. On each side of the lower roadway the space is used for the fresh air supply ducts. Mechanical ventilation is required as the tube is for motor and steam-driven cars. At the deepest point, the tunnel is 170 ft. below high water. The length between shafts is 76 ft. less than 1 m. and the total length of the tunnel, including two branches on each side of the river for entrance and exits, is 2·93 miles. The maximum grade is 3·33%. The estimated capacity, at 15 m. per hour spaced 100 ft. apart, is 3,000 vehicles per hour, requiring about 9 minutes for passage. The cast iron required for lining is over 110,000 tons and the concrete lining 150,000 cubic yards. The estimated cost is £5,000,000. Work was started on the shafts in Jan. 1926 and completion is expected in 1931. The work is done under the Mersey Tunnel Act, of 1925, modified by an act of 1927. The cost is to be contributed one-half by the Ministry of Transport, one-fourth by tolls and the remaining portion by Liverpool and Birkenhead in the proportion of their rateable values. Basil Mott and J. A. Brodie are the engineers, with B. H. M. Hewett in charge, and the contractors for shafts, drifts and the enlargement of the tunnel were Edmund Nuttall, Sons and Co. Ltd.

Tunnels have been proposed for undersea connection between England and France, beneath the English channel; even between Alaska and Siberia and beneath the entrance to the Mediterranean at Gibraltar; but aside from the great cost, due to great length and depth, questions of national military defence arise.

SINKING TUBES, CAISSONS, COFFER-DAMS, ETC.

In 1845, De la Haye, in England, doubtless having in mind the tedious and difficult work of the Thames tunnel, proposed to make tunnels under water by sinking large tubes on a previously prepared bed and connecting them together. Since then many inventors have proposed similar schemes. In 1866 Belgrand sank twin-plate iron pipes, 3·28 ft. in diameter and 512 ft. long, under the Seine at Paris for a sewer siphon, and there have since been numerous examples of sunk cast iron subaqueous water-pipes.

First Subaqueous Trench Tunnel.—It is believed that the first tunnel of this class, large enough for men to move upright in, was by H. A. Carson, assisted by W. Blanchard and F. D. Smith (in 1893–94), in the outer portion of Boston harbour, for the metropolitan sewer outlet. The later tubes were about 9 ft. exterior diameter, in sections each 52 ft. long weighing about 210,000 lbs., made of brick and concrete, with a skin of wood and watertight bulkheads at each end. A trench was dredged in the harbour bed and saddles were accurately placed to support the tubes. The latter, made in cradles above the water alongside a wharf, were lowered and towed ½ to ¾ m. to their final positions. After sufficient water had been admitted they were lowered to their saddles by travelling shears on temporary piles. The temporary joints between consecutive sections were made by rubber gaskets between flanges which were bolted together by divers. The later operations were backfilling the trench over the pipes and, in each section, pumping out the water, removing its bulkheads and making good the masonry between consecutive bulkheads, this maso being inside the flanges. This work, about 1,500 ft. in length, done without contractors, by labourers and foremen under immediate control of the engineers and was found perfectly sou

The double-track railroad tunnel at Detroit, made in 1906– for the Michigan Central railroad, was built under the direct of an advisory board consisting of W. J. Wilgus, chairman, H.

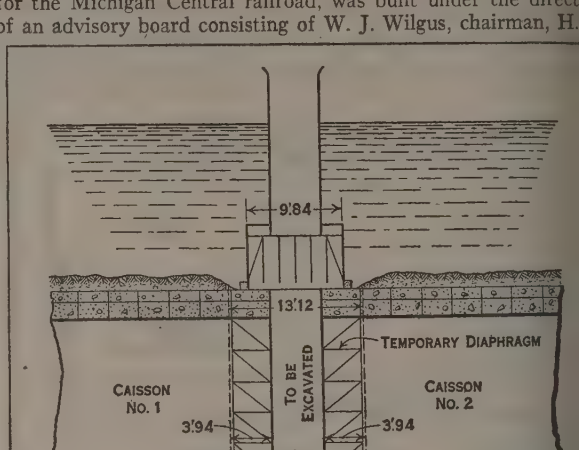

FIG. 5.—LONGITUDINAL SECTION OF COFFER-DAM SHOWN IN FIG.

Carson and W. S. Kinnear, chief engineer. The tunnel is 1·5 long, with a portion of 0·5 m. directly under the river. trench was dredged with a depth equal to the vertical dimensio the tunnel below the river bed and about 70 ft. below the r surface and grillages were accurately placed in it to support ends of thin steel tube forms, inside of which concrete was t moulded and outside of which deposited. These tubes, each ab 23 ft. in diameter and 262·5 ft. long, were in pairs (one tube each track) and were joined together at intervals of 12 ft. by steel diaphragms surrounding the tubes. The planking, to li the concrete, was secured to the outside edges of the diaphrag The tubes were made tight, bulkheaded at their ends, floated place, sunk by admitting water, set on the grillages and the of successive pairs connected together by bolts through rub gaskets and flanges.

The second (1913–15) tunnel crossing of the rapid transit tem at New York beneath the Harlem river from Lexington nue, in Manhattan, to Mott avenue, in the Bronx, consists of tubes 1,080 ft. long. The general design and method of const tion were modifications of those used in the Michigan Cen railroad tunnel at Detroit. The tunnel was built in five secti 199 to 220 ft. in length. A trench was dredged with a width 81 ft. and side slopes of 45°. The sections (770 tons) erected on timber falsework and, to launch them, flat boats run beneath the sections at low tide and the rising tide lifted t from the falsework. The ends of the tubes were provided timber bulkheads to make the tubes float, and when free from falsework they were towed by a tug into the river, where the boats were scuttled and sunk by opening valves provided for purpose. The tubes then floated on their own bottoms and towed to the tunnel site and sunk on the timber caps provi for their support in the river. (*See* Plate, fig. 5.) The water then pumped from the tubes and they were lined with concr The tunnels were completed without the use of compressed air any part of the work. Alfred Craven was chief engineer for Public Service Commission and the contractor was the Ar McMullen and Hoff Company.

The vehicular tunnel beneath the Detroit river, from Det Mich., to Windsor, Canada, was started in 1928. It consist one tube, 0·95 m. long, between portals, with an inside diam

28 ft. 4 inches. The portion beneath the river, 2,500 ft. , is to be built by the subaqueous trench method as in the of the Michigan Central tunnel at Detroit, and the second lem River tunnel, at New York. The land portions, 1,000 ft. 500 ft. in length are shield-driven. The estimated cost is $10,- ,000. Because of the international character of this tunnel, necessary not only to provide for collection of tolls but for oms and immigration inspection, which requires unusual plaza lities at both ends of the tunnel. Parsons, Klapp, Brinckerhoff Douglas are engineers and Porter Brothers, contractors.

he largest diameter tunnel built by the subaqueous trench hod is the Oakland-Alameda estuary tube, in California. It single tube, 0·67 m. in length between portals, of which 2,436 s made up of 12 sections of tubes, each 203 ft. long, sunk in a lged trench, with a depth of water over the tubes of 42 feet. tube sections present the novelty of being made of reinforced crete, 37 ft. external diameter, with a shell thickness of 30 and they are enveloped with a membrane of three-ply water- ofing. They were cast in forms in a dry dock at San Francisco, floated to position and sunk. The roadway is 23 ft. wide for cles, two lines of street railway tracks and also foot-walks pro- ed by railings. The cost is estimated at $4,500,000 or about half the estimated cost if done by the shield method. C. E. y is chief engineer.

unnelling by Sinking Caissons.—The first New York rapid sit tunnel under Harlem river, built in 1904–05, is an example unnel caissons built under water and in part of the work a ion of the permanent tunnel was itself made to serve as the of the caisson. The tunnel has two tubes, each about 15 ft. nterior diameter, the portion beneath the river being 400 ft. , with a surrounding shell of cast iron itself surrounded by crete. The outside width of concrete is about 33 feet. Its top 8 ft. below high water and about 3 ft. below the bed of the r. The method of construction was devised by McMullen MacBean, the contractors, who dredged a trench in the river within 7 or 8 ft. of the required depth. They then enclosed a e of the width of the tunnel, from shore to mid-stream, with n. sheet piling, which was evenly cut off some 2 ft. above determined outside top of the tunnel. On top of this piling sunk and tightly fitted a flat temporary roof of timber, 3 ft. k in sections, which was covered with about 5 ft. of dredged l. An air lock was provided in the roof and the water was lled from this subaqueous chamber by compressed air, after h the remaining earth was easily taken out, and the cast iron concrete tunnel walls were then built in the chamber. For the aining part of the river the foregoing process was varied by ing off the sheet piling at mid-height of the tunnel and making upper half of the tunnel, which was built above and lowered ections through the water, serve as the roof of the chamber in ch the lower half of the tunnel was built in compressed air.

ubaqueous tunnels are usually started from shafts near the gins of the streams and, when in soft ground, the shafts are k by the use of caissons under compressed air. The caissons ain as part of the permanent construction and from them the lds are started. It may therefore be said that nearly all tun- of this class are built in part by caissons. (*See* Plate, figs. d 2.)

he tunnels of the Métropolitain railway of Paris (F. Bienve- , engineer-in-chief) under the two arms of the Seine, between e Chatelet and Place Saint Michel, were made by means of pressed-air caissons sunk beneath the river bed, L. Chagnaud g the contractor. They were built of plates of sheet steel and onry, with temporary steel diaphragms in the ends, filled with crete, making a cross wall with a level top about even with the side top of the tunnel and about 2 ft. below the bottom of the e. The caissons were sunk on the line of the tunnel so that acent ends and the walls just described, were nearly 5 ft. apart n (at that stage) a core of earth between them. Side walls ing the end walls and thus enclosing the earth core on four s (fig. 3) were next made by the aid of temporary small sons sunk through about 26 ft. of earth under the river. The s of the side walls were made even with the end walls. A steel rectangular coffer-dam (figs. 4 and 5) was sunk to rest with rubber or clay joint on these surrounding walls. The coffer-dam had shafts reaching above the surface of the water, so that the earth core was easily taken out in free air, after removing the water. The adjacent chambers under the caissons were then connected together. Three caissons, of a total length of 396 ft. were used under the large arm and two, of an aggregate length of 132 ft. under the smaller arm of the Seine. Construction was started in 1905 and operation was begun in Jan. 1910; the cost of the tunnel was 2,134 francs per linear foot.

At San Diego, Calif., a tunnel 1,200 ft. long was constructed in 1928 by the caisson method. The tunnel has a cross section of 11 by 12 ft., and forms the intake for cooling water for a power plant.

Tunnels Built in Coffer-Dams.—The first subaqueous highway tunnel in the United States was that at Washington street, beneath the Chicago river, in Chicago. It is not properly a tunnel, having been built in a coffer-dam. It was constructed in 1866–69 and has two roadways each 11 ft. wide and 13 ft. high, and a footway 10 ft. wide and 10 ft. high. It has twice been rebuilt to provide a deeper waterway, the original depth being only 14 feet. After the great fire of 1871, it formed the only means of communication between the west side and the business district pending the reconstruction of the bridges. In 1869–71 a similar roadway tunnel was constructed at La Salle street and in 1889–94 one at Van Buren street, both beneath the Chicago river. These also required rebuilding at later dates to provide deeper waterways. All these tunnels are now used for surface cars only.

TUNNELLING BY THE FREEZING METHOD

Tunnelling by freezing the water contained in the soil, and then excavating through the frozen material in a manner similar to rock, has often been proposed. The method has been used for sinking shafts with a fair degree of success in a number of cases. Siberian miners have for years taken advantage of low temperatures to penetrate saturated ground to reach mineral deposits. F. H. Poetsch applied the method in 1883 in sinking a shaft in Saxony, for the Archibald mine.

While fairly successful as applied to shafts, the method has rarely been used for driving tunnels and then not with entire success. In 1884–86, in Stockholm, Sweden, a tunnel for pedestrians was driven in part by the freezing method by Captain Lindmark. The length of the tunnel was 758 ft. and it passed beneath a ridge dividing two parts of the city. The cross section was 12 ft. 8 in. high and 13 ft. 2 in. wide and the material was coarse gravel with large stones and some clay. It contained water and had very little cohesion. The material was frozen by using a dry air (Lightfoot) machine delivering 25,000 cu.ft. of air per hour. The temperature of the air at the machine was −55° C. Only about 80 ft. of the tunnel was constructed by this method, the balance of the soil being of firmer material.

TUNNELLING THROUGH MOUNTAINS

Where a great thickness of rock overlies a tunnel through a mountain it may be necessary or advisable to do the work wholly from the two ends without intermediate shafts. The problem largely resolves itself into devising the most expeditious way of excavating and removing the rock. Experience and modern mechanical devices, such as compressed air drills, and mucking and loading machines, have led to speed and economy.

The Hoosac tunnel, in Massachusetts, on the line of the Fitchburg railroad, was the first prominent tunnel in America, and for many years the longest, being 4·73 m. long. It was begun in 1855 and finished in 1876, after many interruptions. It was memorable for the original use in America of compressed air drills and nitroglycerin, mechanical drilling being adopted in 1866.

In 1857 the first blast was fired in connection with the Mont Cenis work in the Alps, in 1861 machine drilling was introduced and in 1871 the tunnel was opened for traffic. It is located between Modane, France and Bardonecchia, Italy. It is a single tunnel 7·98 m. long, with a "horseshoe" section 26 ft. 3 in. by 24 ft. 7 inches. The material penetrated was granitic and the

average progress 7·7 lin.ft. per 24 hours. The approximate cost was £75 per linear foot. With the exception of about 900 lin.ft. the tunnel is lined throughout with brick or stone. During the first four years, by hand labour, the average progress was not more than 9 in. per day on each side of the Alps, but with compressed air drills the rate towards the end was five times greater.

In 1872 the St. Gotthard tunnel was begun and in 1881 the first locomotive ran through it. It lies between Goschenen and Airolo, in Switzerland. It is 9·3 m. in length and of the same

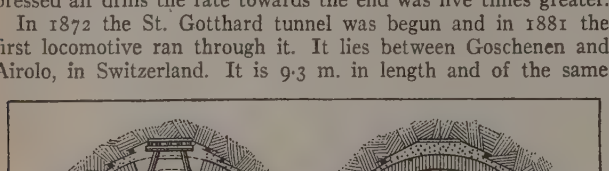

FIG. 6.—METHOD OF EXCAVATION OF ST. GOTTHARD TUNNEL

dimensions as the Mont Cenis. The material also was granitic and the average progress 18 lin. ft. per 24 hours. The approximate cost was £48 per linear foot. Mechanical drills were used from the beginning. Tunnelling was carried on by driving in advance a top heading about 8 ft. square, then enlarging this sideways and finally sinking the excavation to invert level. (*See* details in fig. 6.) Air for working the rock-drills was compressed to seven atmospheres by water turbines of about 2,000 horse-power. The two inclines leading to the summit, which total about 36 m., are 28% tunnel, including seven spirals forming almost complete loops within the mountains, in order to gain altitude and distance.

The driving of the Arlberg tunnel was begun in 1880, and the work was completed in little more than three years. It is a single tunnel, 6·36 m. long, between Innsbruck and Bludenz, in the Tirol. It is 25 ft. 3 in. wide and the average progress in 24 hours was 27·2 linear feet. The approximate cost was £36 per linear foot. The main heading was driven along the bottom of the tunnel and shafts were opened to the upper heading 75 to 210 ft. apart, from which smaller headings were driven right and left. The tunnel was enlarged to its full section at different points simultaneously in lengths of 24 ft., the excavation of each occupying about 20 days and the masonry 14 days. Ferroux percussion air drills and Brandt rotary hydraulic drills were used, the performance of the latter being especially satisfactory. After each blast a fine spray of water was injected, which assisted the ventilation materially. In the St. Gotthard tunnel the discharge of the air drills was relied on for ventilation. In the Arlberg tunnel over 8,000 cu.ft. of air per minute was thrown in by ventilators. To keep pace with the miners, 900 tons of excavated material had to be removed, and 350 tons of masonry introduced daily at each end of the tunnel, which necessitated the transit of 450 wagons. The cost per linear foot varied according to the thickness of masonry lining and the distance from the mouth of the tunnel. For the first 3,000 ft. from the entrance the prices per linear foot were £3 16s. for the lower heading; £2 11s. for the upper one; £10 3s. for the unlined tunnel; £15 for the tunnel with a thin lining of masonry; and £41 8s. with a lining 3 ft. thick at the arch, 4 ft. at the sides and 2 ft. 8 in. at the invert.

The Simplon tunnel was begun in 1898 and completed in 1905. It lies between Brigue, Switzerland and Iselle, Italy. It has a length of 12·3 m. and is over 30% longer than the St. Gotthard. The greatest depth below the surface is 7,005 feet. A novel method was introduced by driving two parallel headings (56 ft. apart, connected at intervals of 660 ft. by oblique galleries), which greatly facilitated ventilation and resulted in increased economy and rapidity of construction, while also insuring the health of the men. One of the headings was enlarged at once to 16 ft. 5 in. wide by 19 ft. 6 in. high, for a single track railroad, but the second was left to be enlarged and similarly used at a later date. (This was undertaken in 1918, during the World War, and completed a few years later.) Had one wide tunnel been m instead of two narrow ones, it would have been difficult to m tain its integrity; even with the narrow cross section employed floor was forced up at points in the solid rock from the g weight above, and had to be secured by building heavy in of masonry. About 2·5 m. from the portal at Iselle, the "G Spring" of cold water was struck. It yielded 10,564 gal. minute at 600 lb. pressure per square inch, and reduced the perature to 55·4° F, the lowest point recorded. A spring of water was met on the Italian side which discharged into the tu 1,600 gal. per minute with a temperature of 113° F. The m mum flow of cold water was 17,081 gal. per minute, and of water 4,330 gal. per minute. These springs often necessitat temporary abandonment of the work. Water-power from Rhone at the Swiss and from the Diveria at the Italian provided the power for operating all plants during construc of most of the work. The material penetrated was gneiss, m schist, limestone and disintegrated mica-schist. The ave progress per 24 hours was 35 lin.ft. and the approximate £49 7s. per linear foot. Among the able engineers connected this work must be mentioned Alfred Brandt, a man of remark energy and ability, whose drills were used with much suc He died early in the work of injuries received from falling

A group of tunnels—the Tauern, Barengraben, Wocheiner Bosruck—was undertaken by the Austrian Government in nection with new Alpine railroads to increase the comme territory tributary to the seaport of Trieste, which at one was greater than Hamburg.

The Loetschberg tunnel, in the Alps of Switzerland, bet Kandersteg and Gopperstein, is 9·04 m. long and the maxi grade 0·38%. It is a double track railway tunnel, and its struction was begun in Oct. 1906 and completed in Sept. 191 was originally planned to be 8·5 m. in length and straight passed beneath the ancient glacial gorge now filled with det and occupied by the Kander river, but at a great depth and it supposed it would be in solid granite. After driving the hea for nearly 2 m. it broke through into the gorge which was with sand, boulders and water under great pressure. In the s of a few moments about 8,000 cu-yd. of the material was ca into the heading. Twenty-five men, the drills and all equip were lost beyond hope of recovery. It was bulkheaded off the line bent to throw it farther into the mountains and ben the gorge and was then successfully completed, the length increased one-half mile. The tunnel is operated electric using 15,000 volts, single phase, alternating current of 16 cy

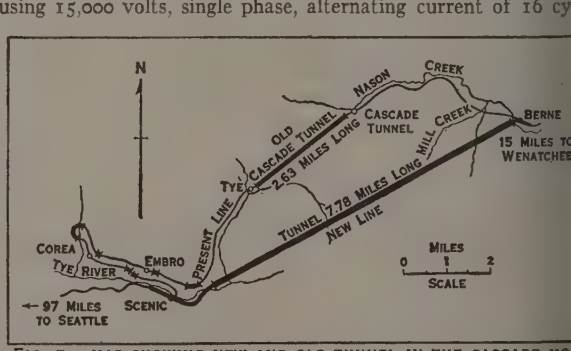

FIG. 7.—MAP SHOWING NEW AND OLD TUNNEL IN THE CASCADE MO TAINS, STATE OF WASHINGTON, U.S.A.

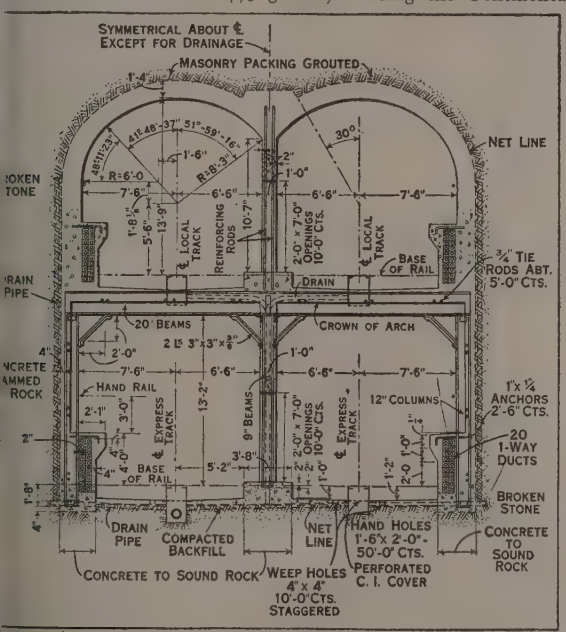
The Connaught tunnel at Rogers pass on the Canadian Pa railway, pierces the Selkirk range of the Canadian Rockies. 5 m. long and replaces a surface line 540 ft. higher up. Its struction saves 5 m. of distance and replaced 5 m. of snow s in a distance of 13 miles. It is a double track tunnel, oper electrically and has a maximum grade of 2·2%. It was between 1913 and 1916 and was the first American tunnel in w a parallel pioneer tunnel was used. Progress on the pio heading reached as high as 817 ft. in 30 days.

Much important tunnel construction has been done in J by the Japanese government railways. Probably the most not

ee Tanna tunnel, between Atami and Mishima, which was ed in 1918 and is not yet (1928) completed, as extraordinary ulties have been encountered. The tunnel is 4·89 m. in h and passes under two mountains and the valley between . The maximum depth below the surface is 1,300 ft. and w the valley 600 feet. It is partly in soft ground and partly ck. The rock is andesite. Several methods of excavation been tried but difficulty with water prevails. At the Atami 17 cu.ft. per second at a pressure of 240 lb. per square inch s the work, and at the Mishima side 48 cu.ft. per second. actual cost of construction up to the present (1928) has been oo per linear foot.

ie Liberty vehicular tunnels penetrate the south hills at Pitts-a, Pa., and connect with the Liberty bridge, over the Monon-a river. They consist of two parallel tunnels, 59 ft. between es, each 26 ft. 7 in. wide, and 1·1 m. long. Each tunnel pro- a single line of street railway track not installed and two of vehicular traffic on a roadway 21 ft. wide. There is also a walk, 4 ft. wide, in each tunnel. The tunnels are lined with rete 24 in. thick. The alignment is straight and the grade inuous at the rate of 0·392%. The work was begun in 1919 completed about three years later. The total cost was about 00,000. For tunnels of their size, unusually rapid progress made in excavating which was due largely to a bonus system aying the workmen. Eleven hours' pay was allowed for 9 ft. nce of excavation and 12 hours' for 10 ft., whether consumed ot. There was also sharp rivalry between the forces in the tunnels, and the men completing their shift first were allowed isplay an American flag at the entrance, the following day, e their competitors were compelled to display a black flag. average rate of advance per day in the tunnels was over 10 or a period of several months.

ne Moffat tunnel, on the Denver and Salt Lake railroad, re- s a surface line with 4% grades, crossing the Continental



COURTESY OF N.Y. CITY BOARD OF TRANSPORTATION

FIG. 8.—TYPICAL FOUR TRACK TUNNEL IN ROCK

ide, about 50 m. west of Denver, Colo. At the time of con-ction it was the longest railroad tunnel in America. It lies n elevation of 9,200 ft. above sea-level, as compared with 60 on the surface line at the summit of the Divide. The k was begun in 1923 and the first train was run through in 1928. The work consists of two parallel tunnels, 75 ft. apart, for a single track railroad, 16 ft. by 24 ft. and one for a r tunnel, 8 ft. by 8 ft., which may be used for the future r-supply of the City of Denver. The work was done by the Moffat Tunnel Commission, and paid for by a bond issue by a district of the State in the vicinity and the City of Denver. The railroad tunnel is leased to the Denver and Salt Lake railroad. The length of the tunnel is 6·1 m. and the cost including the water tunnel was about $15,470,000. The grades of the railroad tunnel rise from the ends toward the centre, on rates of 0·3% from the east and 0·9% from the west. The construction of both tunnels at one time was taken advantage of to use the water tunnel as a pioneer heading, with cross connections to the main railroad tunnel at intervals of about 1,500 ft., as was done in the Simplon tunnel and the Connaught tunnel at Rogers pass, which offered advantages in speed and ventilation. Chloride of lime dumped in one of the lakes, 1,400 ft. above, was found in the tunnel water two hours later.

The new Cascade tunnel of the Great Northern railway, between Berne and Scenic, in the State of Washington, is 7·79 m. long. (*See* fig. 7.) It is the fifth longest railway tunnel in the world and the longest railway tunnel in America. The alignment is straight and the grade 1·565% downward to the west from Berne. Work was started in Dec. 1925. The tunnel was driven from the two portals and a shaft, 622 ft. deep, 2·41 m. from the east end, by the centre heading method, to allow radial drilling. A pioneer tunnel, 66 ft. to one side and parallel with the main tunnel, was also driven, from which cross-drifts were driven at 1,500 ft. intervals. This provided a number of points of attack and insured proper ventilation and drainage. The pioneer heading has a width and height of 10 ft. and was advanced 984 ft. in one month. The pioneer heading was holed through in May 1928, and the main tunnel was completed during the same year and put in operation Jan. 12, 1929. The power used in construction was 2,300 volts, 60-cycle, 3-phase current. The total compressor capacity was 10,450 cu.ft. of free air per minute. Haulage in the headings was by 6-ton, 250-volt trolley locomotives, and for the full section 20-ton trolley locomotives. The locomotives were equipped with gathering reels, which allowed their working 500 ft. beyond the suspended trolley. The line speed of the skip hoists at the shaft was 900 ft. per minute. A total force was employed of about 1,800 men and, because far distant from any settlement, complete camps with cottages, schools, recreation halls, stores and shops were provided, equipped with water-supply, electric lights, sewers and modern plumbing. J. R. W. Davis is chief engineer for the Great Northern railway, and the contractor was A. Guthrie and Co. The line through the tunnel is to be operated electrically. The estimated cost is $16,000,000. (*See* TRACTION, ELECTRIC.)

The electric railway from Eiger glacier to near the summit of the Jungfrau includes a tunnel 1·5 m. long, 11 ft. 10 in. wide and 12 ft. 6 in. high, with a midway station having arches through the side from which a large part of northern Switzerland can be seen. From the Jungfrau terminus, at an elevation of 13,428 ft., the summit, 242 ft. higher, may be reached by an elevator.

Among other important rock tunnels may be mentioned the Albula, through a granite ridge of the Rhaetian Alps, for a single-track narrow-gauge railroad, 3·6 m. long; the Giovi, 6 m. long, north of Genoa, Italy; tunnels on the Midland railway, near Totley in Derbyshire, over 3·5 m. long, largely in shale and at Cowburn, over 2 m. long, in shale and harder rock, each 27 ft. wide and 20·5 ft. high inside; the Arthur Pass tunnel in New Zealand, begun in 1908, 5·3 m. long, for a single track, narrow gauge railway; the Suram, on the Trans-Caucasus railway, for double track, 2·47 m. long, through soft rock; the Graveholz tunnel, on the Bergen railway, in Norway, 3·3 m. long (the longest in northern Europe); the tail-race tunnel for the Niagara Falls Power Company, being 1·3 m. long, 19 ft. wide and 21 ft. high, through argillaceous shale and limestone, costing about $1,250,000; the Tequixquiac outlet to the drainage system for the City of Mexico, 6·2 m. long, costing $6,760,000; the first Cascade tunnel, Washington, part of the Great Northern railway system, 2·63 m. long and saving 9 m. in distance (now replaced by a still longer tunnel, 7·79 m.); the Gunnison, 5·8 m. long, irrigating 147,000 ac. in Colorado; the double track railway tunnel of the Canadian Northern railway, under Mount Royal in Montreal, Canada, 3·5 m. long; and the double track Musconetcong tunnel of the

Lehigh Valley railroad, a little less than 1 m. long and costing $5,000,000, holed through in 21 months (June 1928). An example of a small tunnel of considerable length is the Strickler tunnel. It supplies water to Colorado Springs, from Pike's peak of the Rocky Mountains, in Colorado. It is 1·22 m. long and the cross-section is only 4 by 7 feet.

For many reasons, including both safety of the work and interest charges on the capital investment, speed in tunnel construction is desirable, and such work is always pushed as fast as possible. During the World War, the Northern railway of France built the Marseille-en-Beauvaisis tunnel, a single track railway tunnel, paralleling a similar one in operation and 60 ft. from it, at the rate of 16 ft. per day. It is 1,200 ft. long, in badly fissured chalk formation and is lined with concrete. It was begun May 21, 1918, the headings met June 28 and it was in operation Aug. 4, a period of 75 days.

TUNNELLING IN TOWNS

Where tunnels have to be carried through soft soil in proximity to valuable buildings special precautions have to be taken to avoid settlement. An early successful example of such work is the tunnel driven in 1886 for the Great Northern Railway Company, under the metropolitan cattle market, London. This was done by the crown-bar method, the bars being built in with solid brickwork. The subsidence in the ground was from 1 to about 3½ inches. Several buildings were tunnelled under without any damage.

The District subway of Glasgow, Scotland, consists of a double tube line in the form of a loop, connecting Partick and the northern districts with the centre of the city. It has a length of 6·5 m., and consists in large part of circular tubes, 11 ft. internal diameter, built as tunnels, lined with cast iron and driven with a shield and compressed air. The line crosses twice beneath the Clyde. Work was begun in 1891 and the line opened to traffic in 1897.

London has now some 90 m. of tunnels for railways, mostly operated by electric traction. (*See* TRACTION, ELECTRIC.) Most of those which have been constructed since 1890, comprising some 50 m. of double tube railways, have been tunnelled through clay by the use of cylindrical shields and have linings of cast iron plates. The tubes are generally small, from 10 to 12 ft. in inner diameter, but shields about 23 ft. in diameter were used in constructing the stations on the Central London railway, and one 32 ft. 4 in. in diameter and only 9 ft. 3 in. long was used for a short distance on the Clapham extension of the City and South London railway. The first of the London tube railways to be built was 3·5 m., of the City and South London, from the Bank under the Thames to Stockwell, begun in 1886 and completed in 1900.

Paris has an extensive system of underground railways some 60 m. in length, portions of which were built as tunnels, and a considerable number of which were constructed under the engineering direction of F. Bienvenue. The first line was built in 1898, from Porte Maillot to Porte de Vincennes, and other lines followed at later dates. Instead of using completely cylindrical shields and cast iron walls, as in London, roof-shields (*boucliers de voute*) were employed for the construction of the upper half of the tunnel, and masonry walls were adopted throughout. In general, the upper half of the tunnel was executed first and the lower part completed by underpinning.

In the case of the tunnelling near important buildings in Boston, in 1896, with a roof-shield 29 ft. 4 in. in external diameter, the vertical side walls were first made in small drifts, the roof-shield running on top of these, and the core of earth was taken out later and the invert or floor of the tunnel put in last. Each hydraulic press of the shield reacted against small continuous cast iron rods imbedded in the brick arch.

In some large sewerage tunnels in Chicago the shields were pushed from a wall of oak planks, 8 in. thick, surrounding the brick walls of the sewer. The same method was employed in constructing the portion of the Dorchester tunnel, a part of the Boston subway system, beneath Fort Point channel. The length of this section was 3,060 ft. the external diameter 24 ft. 2 in. and the thickness of the wood 9 inches.

The Pennsylvania railroad tunnels crossing New York city under 32nd and 33rd streets are of unusual size and excavated through mica schist. Owing to the close proximity of large buildings and other structures, special methods were adopted for loosening the rock to lessen the vibrations from explosions.

Quite long sections of the rapid transit system beneath the streets in New York have been built in tunnels. There are about 3 m. of double tube, shield-driven tunnels in Brooklyn. Shorter sections also were built in Manhattan. A portion of the line under Flatbush avenue was built in sand with a shield of unusual size rolling on the completed side walls, as in the case of the Boston subway. A number of the rock tunnels disclose an exceptional size. On the Lexington avenue line, four tracks, two on each of two levels, are in one tunnel excavation, about 32 ft. high and wide. (*See* fig. 8.) The upper level is carried on steel beams supported by columns at the side and centre. The concrete roof is formed of two arches carried by columns. The central portion is known as an "umbrella" section, which it resembles. Beneath St. Nicholas avenue and Fort Washington avenue five of the subway stations are constructed in tunnel, four of which contain two tracks and two platforms within a single arch having a clear span of 48 ft. The width of excavation required was 57 ft. and the height 45 feet. In one case the arch carries a mezzanine platform the entire length of the station, supported by hangers from the arch alone.

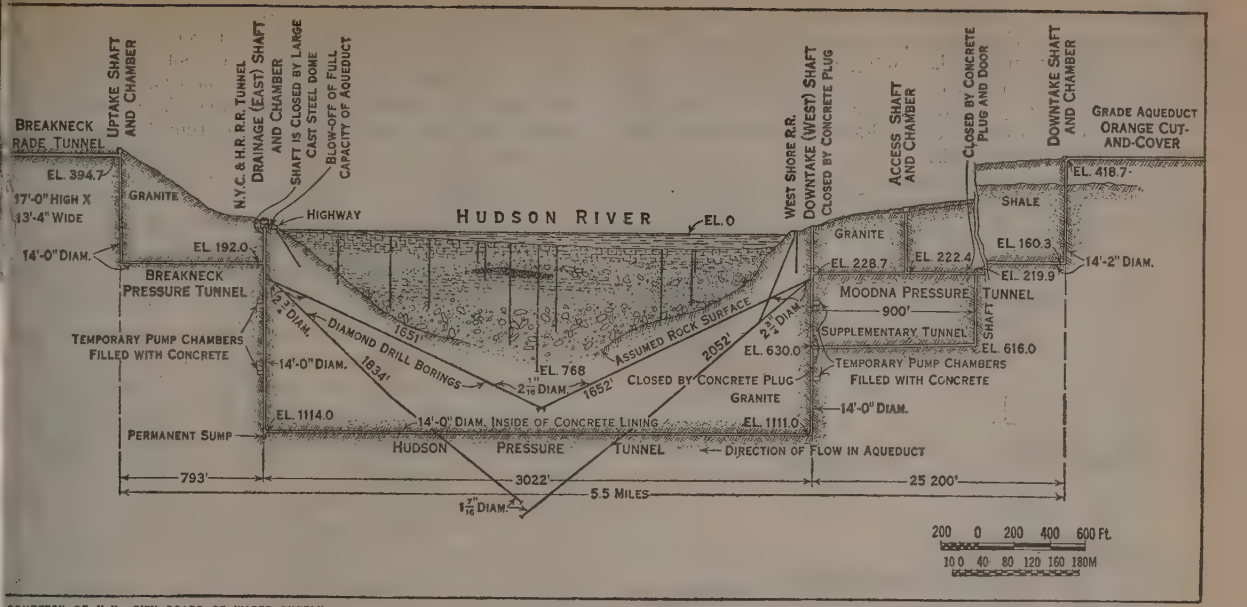
TUNNELS FOR CONVEYING WATER

From very early days, water has been conveyed in aqueducts formed by tunnelling, and some early examples have been mentioned. Generally such tunnels were of small cross-section but many of them were of great length. They also generally follow the grade of the flowing water and where valleys were encountered they were crossed by aqueducts of stone arches, of which examples still exist. Examples of modern tunnelling in connection with water-supply may be found in many sections of the world. Where necessary to obtain water for the supply of large cities it sometimes must be brought from great distances and the sources of supply are generally in mountainous districts.

Both the largest and longest aqueduct tunnels are those supplying water to the City of New York. They also present the notable of sinking to great depths below the hydraulic grade line and rising again to that line to pass beneath river gorges, which are crossed at many points and also to pass beneath the entire length of Manhattan island. This introduces an internal or bursting pressure in the tunnel, which is called "a pressure tunnel."

The Croton aqueduct, from the Croton dam to the gate house at 135th street, constructed 1885–90, forms, in its completed state, a tunnel 31 m. long and includes an inverted siphon or pressure tunnel, passing beneath the Harlem river. A number of open sections were built in open excavation and then covered over.

The Catskill water-supply system, which extends from the Catskill mountains to New York city, a distance of about 160 m., consists in large part of true tunnels and includes both the largest tunnels for such purpose, and the longest tunnels for any purpose in the world. All are concrete lined. There are 25 tunnels on the hydraulic grade, with a total length of 32 m., including the tunnel beneath the Shandaken mountains, 18·1 m. long, about 40 m. south-west of Albany, N.Y. It has a "horseshoe" section 11 ft. 6 in. high by 10 ft. 3 in. wide and is the longest continuous tunnel in the world for any purpose. Seven shafts were used in constructing this tunnel. There are also seven pressure tunnels crossing beneath river valleys, including that beneath the Hudson river from Storm King to Breakneck mountain, at a depth of 1,114 ft. below sea-level. It is 14 ft. internal diameter and 2,200 ft. between the shafts on either side of the river. (*See* fig. 9.) The total length of the Catskill aqueduct pressure tunnels exclusive of the city aqueduct tunnels is 17 m. and they are from 11 ft. to 17 ft. 6 in. in diameter. The city aqueduct tunnel extends from Hillview reservoir, beneath the Harlem river and nearly the entire length of Manhattan island and the East river, to shafts in Brooklyn, a distance of 18 miles. It is the second longest tunnel in the world, and the longest carrying water under pressure. To pro-



COURTESY OF N.Y. CITY BOARD OF WATER SUPPLY

FIG. 9.—CROSS-SECTION OF THE HUDSON RIVER CROSSING OF THE CATSKILL AQUEDUCT, LOOKING DOWN-STREAM, SHOWING THE LOCATION OF THE TUNNEL AND THE DIAMOND-DRILL BORINGS MADE TO EXPLORE THE ROCK TO DETERMINE ITS LOCATION

stance to the bursting pressure of the water and also water-itness, it is placed in the rock from 200 to 750 ft. below the face of the streets beneath which it was built. It was driven m 25 shafts, averaging 4,000 ft. apart. The work of con-ucting the Catskill aqueduct system, including the reservoirs, city tunnel and the Shandaken tunnel, occupied from 1905 to 6.

n 1920, a tunnel 4·5 m. long, 9 ft. wide and 9·5 ft. high was un in the Alps of Switzerland, to convey water to an hydro-tric plant. The Nevada irrigation tunnel is 4·1 m. long and a cross-section 9 by 9 feet. It was completed in May 1928 a cost of $1,500,000.

TUNNELS FOR CANALS OR WATERCOURSES

Tunnels for the diversion of streams or canals are of very early e. South of Seleucia, in Turkey in Asia, a river flows through unnel 20 ft. wide and 23 ft. high, excavated 1,600 years ago ough rock so hard that the chisel marks are still discernible. 1766 a tunnel 9 ft. wide, 12 ft. high and 1·63 m. long was begun the Grand Trunk canal, England, and completed 11 years later; l this was followed by many others.

The largest of its kind is the recently completed (1927), Rove inel, connecting the Port of Marseilles, France, by canal with river Rhone. It is 72 ft. wide (width of water 60 ft.) and 50 high inside and 4·53 m. long. The cross-sectional area is about times that of the average double track railway tunnel. Its nstruction occupied 15 years, and its cost was about 135,000,000 ncs, paid by the French Government, the chamber of commerce l the City of Marseilles. The entire cost is to be returned by ls. The quantity of material excavated was greater than any ier tunnel in Europe, about 2,250,000 cu.yd., or 25% more n the great Simplon tunnel. It is lined with masonry, has a tow h 6 ft. wide on each side in the form of a series of small arches l has a large masonry portal at each end. This tunnel is 1·7 m. ger than a similar canal tunnel between the Marne and the ine.

VENTILATION OF TUNNELS

Ventilation of Steam Railway Tunnels.—The simplest thod for ventilating a railway tunnel is to have numerous wide enings to daylight at frequent intervals. If these are the full lth of the tunnel, at least 20 ft. in length, and not farther apart n about 500 ft., a tunnel can sometimes be naturally and ade-ately ventilated. Such arrangements are, however, frequently practicable, especially in long and deep tunnels, and then re-course must be had to mechanical means. Not only long tunnels, but often those relatively short, require artificial ventilation when on a steep gradient, as the smoke and gases have a tendency to travel up the grade with the locomotive, which is then working at full capacity. Natural ventilation depends for its action upon the difference of temperature within the tunnel or ventilation shaft, and the outer air. In winter the draft is upward and in summer often downward. In the spring and autumn there are often periods when there is little difference in temperature and, in consequence, little circulation of air. Most steam railway tunnels are poorly ventilated, except where the difference in elevation of the ends or the prevailing winds, creates a natural draft through them. The need for ventilation is far greater with steam locomotion than with electric motors.

The first application of mechanical or fan ventilation to railway tunnels was made in the Lime street tunnel of the London and North Western railway, at Liverpool, which has since been replaced by an open cutting. At a later date fans were applied to the Severn and Mersey railway tunnels.

Where possible, the principle ordinarily acted upon, where mechanical ventilation has been adopted, is to exhaust the vitiated air at a point midway between the portals of a tunnel, by means of a shaft with which is connected a ventilating fan of suitable power and dimensions. In the case of the tunnel under the Mersey river such kind of shaft could not be provided, owing to the river being overhead, but a ventilating heading was driven from the middle of the river (at which point entry into the tunnel was effected) to each shore, where a fan 40 ft. in diameter was placed. In this way the vitiated air is drawn from the lower point of the railway, while fresh air flows in at the stations on each side to replenish the partial vacuum.

The principle was that fresh air should enter at each station and "split" each way into the tunnel, and that thus the atmosphere on the platforms should be kept pure. In the Mersey tunnel there are five fans; two are 40 ft. in diameter by 12 ft. wide and two 30 ft. in diameter by 10 ft. wide, one of each size being erected at Liverpool and at Birkenhead respectively. In addition there is a high speed fan, 16 ft. in diameter, in Liverpool, which throws 300,000 cu.ft. per minute. The ventilation of this tunnel was satisfactory up to a train schedule of 300 trains per day, or one each way every five minutes. As the traffic increased the air shaft became coated with soot several inches thick and arrangements were made to instal electric power.

The central point of the Severn tunnel lies toward the

Monmouthshire bank of the river and ventilation is effected from that point by means of one fan placed on the surface at Sudbrooke Monmouth, at the top of a shaft which is connected with a horizontal heading leading to the centre of the tunnel. This fan, which is 40 ft. in diameter by 12 ft. in width, removes from the tunnel some 400,000 cu.ft. per minute, and draws in an equivalent volume of fresh air from the two ends.

About 1896 an excellent system was introduced by Signor Saccardo, an Italian engineer, which to a great extent minimized the difficulty of ventilating long tunnels under mountain-ranges where

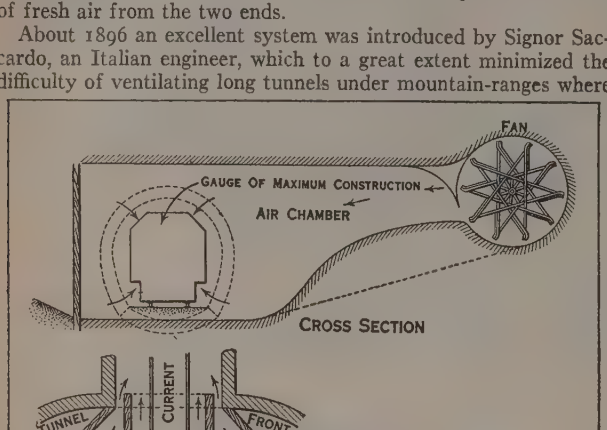


FIG. 10.—DIAGRAM ILLUSTRATING THE SACCARDO SYSTEM FOR VENTILATING TUNNELS

shafts are not available. This system, which is not applicable to tunnels in which underground stations exist, is based upon the principle of the ejector, and is illustrated in fig. 10, which represents its application to the single-line tunnel through the Apennines at Pracchia. This tunnel is one of 52 single line tunnels, with a gradient of 1 in 40, on the main line between Florence and Bologna, built by Thomas Brassey. There was a great deal of traffic which had to be worked by heavy locomotives. Before the installation of a ventilating system, under any condition of wind, the state of this tunnel, about 9,000 ft. in length, was bad; but when the wind was blowing in at the lower end at the same time that a heavy goods or passenger train was ascending the gradient the condition of affairs became very much worse. The engines, working with the regulators full open, often emitted large quantities of both smoke and steam, which travelled concurrently with the train. The goods trains had two engines, one in front and the other at the rear, and when, from the humidity in the tunnel, due to the steam, the wheels slipped and possibly the train stopped, the state of the air was indescribable. A heavy train with two engines, conveying a royal party and their suite, arrived on one occasion at the upper exit of the tunnel with both enginemen and both firemen insensible; when a heavy passenger train came to a stop in the tunnel, all the occupants were seriously affected.

In applying the Saccardo system, the tunnel was extended for 15 or 20 ft. by a structure either of timber or brickwork, the inside line of which represented the line of maximum obstruction of the tunnel, and this was allowed to project for about 3 ft. into the tunnel (fig. 10). The space between this line and the exterior constituted the chamber into which air was blown by means of a fan. Considering the length of tunnel, it might at first be thought there would be some tendency for the air to return through the open mouth, but nothing of the kind happened. The whole of the air blown by the fan, 164,000 cu.ft. per minute, was augmented by the induced current yielding 46,000 cu.ft. per minute, making a total of 210,000 cu.ft.; and this volume was blown down the gradient against the ascending train so as to free the driver and men in charge of the train from the products of combustion at the earliest possible moment. Prior to the installation of this system the drivers and firemen had to be clothed in thick woollen garments, pulled on over their ordinary clothes, and wrapped round and round the neck and over the head.

The Saccardo system was installed in 1899 at the St. Gott tunnel with most beneficial results. The ventilating plant is ated at Goschenen at the north end of the tunnel and consis two large fans operated by water-power. The quantity o pressed into the narrow mouth of the tunnel is 413,000 c per minute at a velocity of 686 ft., this velocity being muc duced as the full section of the tunnel is reached. After inst tion, a sample of the air taken from a carriage contained 10·19 parts of carbonic acid gas per 10,000 volumes.

In the Simplon tunnel (12·3 m. long), where electricity is motive power, mechanical ventilation was installed at the tim construction at each end of the tunnel, both for construction poses and to serve as permanent equipment. It is based on a ferent principle than the Saccardo system. A steel sliding do arranged at each entrance to be raised and lowered by ele power. After the entrance of a train the door is lowered and air forced into the tunnel from the same end at considerable sure by fans. Since completion of the second tunnel following World War an additional ventilation plant has been built at north end of the tunnel.

The Moffat tunnel in Colorado (6·1 m. long) is ventilated mechanical plant based on the principle of forced or induced created at one end of the tunnel. A building was erected at east portal which forms an extension of the tunnel and provid fan chamber on each side. A vertical lift gate is provided to the portal. Two fans are provided, which differ for experim reasons. Each has a diameter of 9 ft. and width of 6 feet. motors are of 750 and 500 h.p. with capacities of 450,000 350,000 cu. ft. per minute, at velocities of 14 and 10 m. hour, respectively. Only one fan is operated, the other hel reserve. The ventilation is by forced draft for east bound tr and induced draft for west bound trains, which forces the sm back along the train. The results are very satisfactory.

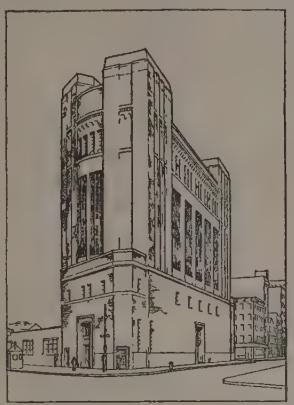
Other railway tunnels partially or completely ventilated mechanical draft are the Giovi tunnel, in Italy; Hoosac tu in Massachusetts; East Mahanoy tunnel, in Pennsylvania; Bend tunnel, in West Virginia; Elkhorn tunnel, in West Virgi and the Gallitzen tunnel, in Pennsylvania.

Volume of Air Required for Ventilation of Railw Tunnels.—The consumption of coal by a locomotive during passage through a tunnel having been ascertained, and 29 c of poisonous gas being allowed for each pound of coal consu the volume of fresh air required to maintain the atmosphere of tunnel at a standard of purity of 20 parts of carbon dioxid 10,000 parts of air is ascertained as follows: The numbe pounds of fuel consumed per mile, multiplied by 29, multip by 500 and divided by the interval in minutes between the tra will give the volume of air in cubic feet which must be introdu into the tunnel per minute.

Ventilation of Tunnels for Electric Traction.—The in duction of electric traction has simplified the problem of vent ing intra-urban railways laid in tunnels at a greater or less tance below the surface, since the absence of smoke and prod of combustion from coal and coke renders necessary only s a quantity of fresh air as is required by the passengers staff. For ventilation the shallow tunnels which form the un ground portions of the Metropolitan and District railways in L don, open staircases, blow-holes and sections of uncovered tr are relied on. When the lines were worked by steam locomot they afforded notorious examples of bad ventilation, the pro tion of carbonic acid gas amounting to from 15 or 20 to 60, 70 even more parts in 10,000. Since the adoption of electricity the motive power the atmosphere of the tunnels has very m improved. Samples taken from the cars in 1905 after the ad tion of electricity gave as low as 11·27 parts in 10,000.

When deep level "tube" railways were first constructed in L don, it was supposed that adequate ventilation would be obtai through the lift-shafts and staircases at the stations, with the of the piston action of the trains which, being of nearly the s cross-section as the tunnel, would, it was supposed, drive the in front of them out of the openings at the stations they w

roaching, while drawing fresh air in behind them at the stations had left. This expectation, however, was disappointed and was found necessary to employ mechanical means. On the tral London railway, which runs from the Bank of England to pherd's Bush, a distance of 6 m., the ventilating plant installed 902 consists of a 300 h.p. electrically driven fan, which is ed at Shepherd's Bush and draws in fresh air from the Bank of the line and at other inter- liate points. The fan is 5 ft. and 20 ft. in diameter, and es 145 revolutions a minute, capacity being 100,000 cu.ft. minute. It is operated from 4 A.M. and, the openings at the intermediate stations be- closed, it draws fresh air in at Bank station. The tunnel is cleared out each night, dur- the period when trains are operated, and the air is left the same condition as it is side. The fan is also worked ing the day from 11 A.M. to P.M., the intermediate doors ng open. In a number of later tube railways in Lon- —such as the Baker street Waterloo, and the Charing ss and Hampstead lines— trically driven exhaust fans are provided at about half-mile rvals; these each extract 18,500 cu.ft. of air per minute from tunnels and discharge it from the tops of the station roofs. The Boston system of electrically operated subways and tun- is ventilated by electric fans capable of completely changing air in each section about every 15 minutes. Air admitted at tals and stations is withdrawn midway between stations.



BY COURTESY OF N.Y. STATE BRIDGE AND TUNNEL COMMISSION

BUILDING FOR THE HOUSING OF THE MACHINERY BY WHICH FRESH AIR IS FORCED INTO THE HOLLAND TUNNEL AND USED AIR WITHDRAWN

In the southerly 5 m. of the first rapid transit subway at New rk, constructed between 1900 and 1904, which is a four track ucture of rectangular section, having the area of 650 sq.ft. and lt as close as possible to the surface of the streets, ventilation natural means through the open staircases at the stations was first relied upon. The results were satisfactory as regards the portions of carbonic acid gas found in the air, but when in- sely hot weather prevailed the tunnel air was sometimes 5° hot- still, due to the conversion of electric energy into heat. Venti- on chambers were added on each side of the subway at points ween stations, and the condition became much improved. ese chambers are beneath the sidewalks and covered by grat- s, and they have been incorporated in the construction of all ways built later. In addition, a partition wall separates track- ys for trains running in opposite directions and the piston ion of the trains induces a satisfactory circulation of the air.

Ventilation of Vehicular Tunnels.—The need of mechani- ventilation of vehicular tunnels is a development of the last neration due to the advent of vehicles propelled by internal mbustion engines. The exhaust from such engines contains oke and gases, which are irritating to the eyes and also contains considerable percentage of carbon monoxide, a highly poison- s gas. The first studies of the need of ventilation for vehicular nnels were undertaken in connection with the construction of e Holland tunnel, at New York, because of its length and the ge volume of traffic which was expected to use it. At that time 920) natural draft was relied upon for the ventilation of all ch tunnels in operation, including the Blackwall and Rotherhithe nnels, in London, which were by far the most important. The affic in them, however, was only about 100 motor vehicles per ur for each tunnel, compared with an estimated traffic of 1,900 otor vehicles per hour in each tube of the Holland tunnel. Re- arch studies and exhaustive tests were made for this tunnel with e co-operation of the U.S. Bureau of Mines to determine first, e amount and composition of exhaust gases from motor vehicles; cond, the physiological effects of these gases and third, the friction losses and power required to handle large quantities of air through concrete ducts.

In the Holland tunnel, the transverse system of ventilation was adopted. The fresh air is introduced continuously along each tube, from conduits provided for the purpose, and taken off at frequent intervals at opposite points. The air therefore travels a course transverse to that of the vehicles and there is a practically equal degree of purity at all points in the tubes. Because carbon monoxide is lighter than air and the exhaust motor gases are warmer than the fresh air introduced in the tunnel and therefore tend to rise, the fresh air ducts are placed beneath the roadways and the exhaust ducts above the roadway ceiling but all in the same tunnel tube. The fresh air is introduced in each roadway by continuous slots along each side above the floor, and the vitiated air is exhausted through louvers in the roof at 15 ft. intervals. The entire tunnel atmosphere is completely changed every 1½ minutes or 40 times per hour, but so uniformly and gently that the current is hardly perceptible. This eliminates the fire hazard incident to a longitudinal circulation of draught. There are four ventilation shafts, one at each pierhead line and one about midway between the pierhead and portal on each side of the river. The fans are located in the shaft buildings and there are 84 in all, one-half blowers and one-half exhausters.

The Liberty tunnels were the first long vehicular tunnels in which artificial ventilation was used. The method adopted is the longitudinal draft system, based on Saccardo's, with modifications by C. S. Churchill. The flow of air in each tunnel is with the traffic, and is induced from a shaft near the centre of each tunnel. Each shaft is divided into two compartments, one of which is used to exhaust the air which enters at the portal from the first half of the tunnel, and the other to blow fresh air into the tunnel at the centre and force it forward to the exit portal. Suitably designed nozzles at the centre of the tunnels, at the shafts, prevent the mixing of the air being introduced and ejected. The flow of air is continuous in each tube in opposite directions and wind pipes are provided at the exit of each tube to prevent interference with the ventilation by adverse winds. The ventilating plant and fans are on the hilltop near the centre of the tunnels, at the shafts. The plant was designed to provide for a double line of motor cars in each tube, spaced 100 ft., moving at 15 m. per hour and a proportion of carbon monoxide at 6 parts in 10,000 at the point of exit, the average, therefore, being 3 parts in 10,000. This required the supplying of 280,000 cu.ft. of air per minute in each tube at a velocity of 6 m. per hour. (*See* also TRACTION, ELECTRIC; TRANSPORT; AQUEDUCTS; etc.) (R. RY.)

TUNNY (*Thunnus thynnus*) the largest fish of the mackerel family, reaching a length of over 10 ft. and a weight of 1,500 lb. It is robust in form, bluish above, grey spotted with silver below. The tunny is found in all warm seas, and periodically approaches the coasts; it feeds on other fishes. It is excellent as food. In the Mediterranean especially, the fishing is extensive.

The sport of catching tunny or "tuna" with rod and line from motor-boats originated at Avalon, Calif., and has spread to New Zealand and Europe. At Avalon the Tuna Club regulates the weight of rod and strength of line, and the capture of a large fish may occupy several hours.

TUNSTALL (or TONSTALL), **CUTHBERT** (1474–1559), English prelate, natural son of Thomas Tunstall of Thurland Castle, Lancashire, seems to have studied at Oxford, at Cambridge and at Padua. Having held several livings in quick succession, he became chancellor to William Warham, archbishop of Canterbury,

in 1511. He was employed on diplomatic business by Henry VIII. and Wolsey, being sent to Brussels in 1515 and to Cologne in 1519, while he was at Worms during the famous Diet of 1521. In 1516 he had been made master of the rolls; in 1521 he became dean of Salisbury; in 1522 bishop of London, and in 1523 keeper of the privy seal. For Henry VIII. he negotiated with Charles V. after his victory at Pavia in 1525 and he helped to arrange the Peace of Cambrai in 1529. In 1530 he succeeded Wolsey as bishop of Durham. Tunstall adhered firmly to the traditional teaching of the Church, but after some slight hesitation he accepted Henry as its head and publicly defended this position. In 1537 the bishop was appointed president of the new council of the north, but although he was often engaged in treating with the Scots he took part in other public business and attended parliament, where in 1539 he participated in the discussion on the bill of six articles. Although he disliked the religious policy pursued by the advisers of Edward VI. and voted against the first act of uniformity in 1549, he continued to discharge his public duties without molestation until after the fall of the protector Somerset; then in May 1551, he was placed in custody. A bill charging him with treason was introduced, but the House of Commons refused to pass it; he was, however, deprived of his bishopric in October 1552. On the accession of Mary in 1553 he was released and was again bishop of Durham, but during this reign he showed no animus against the Protestants. When Elizabeth came to the throne he refused to take the oath of supremacy, and he would not help to consecrate Matthew Parker as archbishop of Canterbury. He was placed under arrest at Lambeth, where he died on Nov. 18, 1559.

Among Tunstall's writings are *De veritate corporis et sanguinis domini nostri Jesu Christi in eucharistia* (1554); and *De arte supputandi libri quattuor* (1522). The bishop's correspondence as president of the council of the north is in the British Museum.

TUNSTALL, market town, in Staffordshire, England. Pop. (1921) 22,740. It is one of the towns which amalgamated in 1910 to form the municipal borough of Stoke-on-Trent (*q.v.*) which in 1925 became a city. The town is of modern growth. The Victoria Institute (1889) includes a library and schools of art and science. The neighbourhood is full of collieries, ironworks and potteries. Kidsgrove, Chatterley and Talk-o'-th'-hill are large neighbouring villages. There are brick and tile works in Tunstall.

TUPELO, a city of north-eastern Mississippi, U.S.A., on the west fork of the Tombigbee river; the county seat of Lee county. It is at the intersection of Federal highways 45 and 78, and is served by the Frisco and the Mobile and Ohio railways. Pop. (1920) 5,055 (41% negroes), estimated locally at 6,500 in 1928. It is the seat of a military institute.

TUPIAN (Tupi), a group of tribes of South American Indians, occupying at the time of the first European contact a narrow and probably continuous strip of the Brazilian coast, from the vicinity of Rio de Janeiro northward nearly to the mouth of the San Francisco river. The original home of this stock probably lay in southern Matto Grosso and Paraguay.

The Tupi tribes were everywhere sedentary or semi-sedentary agriculturalists, hunters and fishermen, but on the Atlantic coast fish was almost the staple food. As a rule they wore very little clothing, made much use of feather ornaments and decoration, and wore small labrets in the lower lip. They lived in large communal houses of light construction, although some had the walls of wattle and daub, and protected their often large villages by means of palisades. Their weapons were the bow and club, but they made no use of poison on their arrows. They were skilled canoemen, and their vessels carried as many as 60 men. The Tupi tribes were warlike, and strongly organized for war, and commonly ate their prisoners. The dead had their burial in large pottery urns. The language of the coastal Tupis was adopted by the Jesuit missions as a lingua franca throughout a large part of Brazil, and this in time grew into the still considerably used *lingua geral.*

See C. F. P. von Martius, *Beiträge zur Ethnographie und Sprachenkunde Amerikas,* etc. (Leipzig, 1867); H. von Ibering, *The Anthropology of the State of S. Paulo, Brazil* (São Paulo, 1906).

TUPPER, SIR CHARLES, Bart. (1821–1915), B colonial statesman, son of the Rev. Charles Tupper, D.D., born at Amherst, Nova Scotia, on July 2, 1821, and was edu at Horton Academy. He afterwards studied for the medical fession at Edinburgh University, where he received the dipl of M.D. and L.R.C.S. In 1855 he was returned to the Scotia Assembly for Cumberland county. In 1862 he was pointed governor of Dalhousie College, Halifax; and from till 1870 he was president of the Canadian Medical Associa Tupper was a member of the executive council and provi secretary of Nova Scotia from 1857 to 1860, and from 186 1867. He became prime minister of Nova Scotia in 1864, and that office until the Union Act came into force on July 1, when his government retired. He was a delegate to Great Br on public business from the Nova Scotia government in and 1865, and from the Dominion government in March Tupper was leader of the delegation from Nova Scotia to Union conference at Charlottetown in 1864, and to tha Quebec during the same year; and to the final colonial confer in London, which assembled to complete the terms of unio 1866–1867. He was sworn a member of the privy counc Canada, June 1870, and was president of that body from date until July 1, 1872, when he was appointed minister of in revenue. This office he held until February 1873, when he bec minister of customs under Sir John Macdonald, resigning with ministry at the close of 1873. On Sir John's return to powe 1878, Tupper became minister of public works, and in the fol ing year minister of railways and canals. Tupper was the au of the Public Schools Act of Nova Scotia, and had been la instrumental in moulding the Dominion Confederation Bill other important measures. Sir Charles represented the co of Cumberland, Nova Scotia, for thirty-two years in successi first in the Nova Scotia Assembly, and subsequently in Dominion parliament until 1884, when he resigned his sea being appointed high commissioner for Canada in London.

Shortly before the Canadian Federal elections of February 1 Tupper re-entered the Conservative cabinet as finance mini By his efforts the Canadian Pacific railway was enabled to a loan of $30,000,000, on the strength of which the line finished several years before the expiration of the contract t He resigned the office of finance minister in May 1888, whe was reappointed high commissioner for the Dominion of Ca in London. Tupper was one of the British plenipotentiaries to Fisheries Convention at Washington in 1887. When the Domi cabinet, under Sir Mackenzie Bowell, was reconstituted in uary 1896 Tupper accepted office, and in the following Apri succeeded Bowell in the premiership. On both patriotic commercial grounds he urged the adoption of a preferer tariff with Great Britain and the sister colonies. At the gen election in the ensuing June the Conservatives were seve defeated, and Tupper and his colleagues resigned, Sir Wil Laurier becoming premier. At the next general election, 1900, Tupper, long the Conservative leader, sustained in his constituency of Cape Breton his first defeat in forty years.

See his *Recollections of Sixty Years* (1914); and E. M. Saun *Life and Letters of Sir Charles Tupper* (2 vols., 1916).

TUPPER, MARTIN FARQUHAR (1810–1889), Eng writer, the author of *Proverbial Philosophy,* was born in Lon on July 17, 1810, the son of a doctor of Huguenot descent. He educated at Charterhouse and at Christ Church, Oxford. was called to the bar at Lincoln's Inn, but never practised. began a long career of authorship in 1832 with *Sacra Poesis* in 1838 he published *Geraldine, and other Poems,* and for f years was fertile in producing both verse and prose; but his na is indissolubly connected with his long series of didactic mora ings in blank verse, the *Proverbial Philosophy* (1838–67) wh for about 25 years enjoyed an extraordinary popularity. T first part was, however, a comparative failure, and N. P. Wi the American author, took it to be a forgotten work of the 1 century. He died at Albury, Surrey, on Nov. 29, 1889.

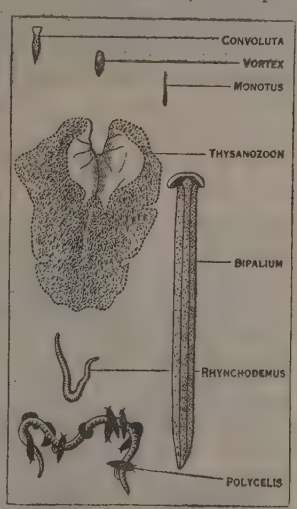
TURA, COSIMO (1430–1498), founder of the Ferrar school of painting, was born at Ferrara and in his youth appe

have visited Padua and Venice. He spent most of his life at rrara, where he was court painter to the dukes Bono and ole. Between 1465 and 1467 he decorated the library of os of Mirandola with allegorical figures. These works, now troyed, were described at length by Lilius Gregorius Giraldus *rrarensis Historiae Poetarum*, Basle 1580). The decorations Duke Borso's chapel at Belriguardo have also perished. In 9 he painted the organ shutters in the cathedral of Ferrara. ese two panels, representing an "Annunciation" and a "St. orge slaying the Dragon" are still extant. The Berlin museum one of the most important works of the master, "The Virgin Child Enthroned and saints." Another notable work is the adonna and Child enthroned surrounded by six angels playing musical instruments" (National Gallery, London). This nting was the central panel of an altarpiece of which the ette representing "the Pietà" is in the Louvre, and one of the gs representing "a monk kneeling and two saints" is in the lonna collection, Rome. Other notable works are the "St. ome" (National Gallery, London); the "Pietà" in the rrer Museum, Venice, and a madonna at Bergamo.

ee E. Gardner, *The Painters of the school of Ferrara* (1911).

TURBELLARIA (Planarians), a class of flat-worms or tyhelminthes (*q.v.*) in which the body is unsegmented and ered with a ciliated epidermis, and an alimentary canal is erally present. Almost all the group are free-living.

General Morphology.—The body is either subcylindrical or tened and leaf-like or ribbon-like. In length the species range m a fraction of a millimetre to some 20 centimetres. In many ms there is a flat creeping (ventral) surface. At or near the erior end there may be a pair or more of tentacles, and a pair eyes, or numerous eye-spots. s margins of the body, in some the leaf-like aquatic forms, very mobile and capable of ming fin-like membranes, with ich the animals swim after manner of a skate. The dor- surface of the body is often mented, and the colours and rkings, especially in terrestrial ms, may be very striking and liant. In certain aquatic cies a green or brown colour produced by the presence in tissues of symbiotic green brown algae.



AFTER VON GRAFF IN PARKER AND HASWELL, "TEXT-BOOK OF ZOOLOGY" (MACMILLAN)

FIG. 1.—EXTERNAL APPEARANCE OF VARIOUS TYPES OF TURBELLARIA
The upper three are small aquatic Rhabdocoelida. *Thysanozoon* is a marine Polyclad; the next two are terrestrial Triclads, and the bottom, a common fresh-water Triclad. All are shown feeding on a dead earthworm

The epidermis consists of a gle layer of ciliated, glandular s. These cells secrete a mu- l slime and often also solid, iform, refringent rods known "rhabdites." Below the epi- mis is a basement membrane, l below this various layers of scle-fibres (circular, longitud- l and sometimes also diag- l). As in the other classes of tyhelminthes, the internal or- s are embedded in parenchy- tous tissue, though in some of more highly specialized forms a slight space (schizocoel) sur- nds the alimentary canal.

The mouth is very variable in position. In some forms it is ced anteriorly, but more often it lies towards the middle, or n behind the middle, of the ventral surface. It leads, usually ough a muscular pharynx with more or less mobile and pro- sible margins, into a digestive organ which, in some cases coela), is a solid syncytial mass, but more often forms a low sac. This sac-like gut may be simple, lobate or branched, as a rule, has no opening to the exterior except the mouth.

The nervous system consists of paired anterior ganglia lying trally to the gut, and giving off various lateral, dorsal and ventral fibres which are interconnected by other fibres. Tactile organs are generally distributed over the skin, and may take the form of special hair-like cilia. Other sensory organs also occur in the form of statocysts, ciliated cephalic pits or grooves, and eyes. The eyes may be mere groups of specialized retinal cells surrounded by pigment, or more complex structures provided with a lens. An excretory system of the platyhelminth type, with flame-cells, is usually present. The external opening may be single or paired, ventral or terminal, or there may be multiple excretory pores on the dorsal surface. Almost all the Turbellaria are hermaphrodite, and the reproductive organs are usually complex. The ducts of the male and female organs generally open separately, on the ventral surface and towards the posterior end of the body, the male pore being the more anterior.

FIG. 2.—RHABDOCOELAN TURBELLARIAN (MICROSTOMA LINEARE) UNDERGOING THE PROCESS OF REPRODUCTION BY DIVISION

Classification.—To draw up a natural systematic arrangement of the Turbellaria is a matter of considerable difficulty. An arrangement based primarily on the characters of the digestive apparatus, and due largely to von Graff and Lang, has for many years been looked upon as the standard system, and has been adopted, with slight modifications, in many well-known text-books of zoology. Recently, in consequence partly of the great increase in the number of known forms, there has been a tendency among specialists to consider this simple classification an unnatural one, and somewhat drastic changes have been proposed, notably by Poche (*Arch. f. Naturg.*, 1926). The older classification, which, up to the present, has been generally followed, is given here.

Order I. Rhabdocoelida. Intestine, when present, a simple, straight or irregular sac. Female gonads compact. Small forms (marine or fresh-water) with cylindrical, or more seldom flattened, body.

Tribe 1. Acoela. Digestive organ consists either of scattered cells among the parenchyma or of a syncytial mass without a lumen. Excretory organs of the usual type absent. A median statocyst present above the brain. Testes follicular. Ovaries paired. Marine forms, including the families Proporidae and Convolutidae.

Tribe 2. Rhabdocoela. Digestive organ consists of a straight gut, typically with a lumen, and usually separated from the general parenchyma by a partial cavity (schizocoel). Excretory organs present. Statocyst usually absent. Testes generally paired and compact. Vitellaria may or may not be distinct from the ovaries. Sexes exceptionally separate (*Microstoma*). Marine and fresh-water forms, including a large number of families and genera (Prorhynchidae, Mesostomatidae, etc.). A few forms (*Graffilla, Anoplodium*, etc.) parasitic in marine invertebrates.

Tribe 3. Alloeocoela. An irregular or branching intestine present, distinct from the parenchyma, but schizocoel greatly reduced. Excretory organs present. Testes follicular. Vitellaria and ovaries may or may not be distinct. Almost all species marine, but a few in fresh water. Includes the family Plagiostomidae.

Order II. Tricladida. Intestine consists typically of three main branches, one median and anterior, two posterior, each of which gives off a series of caeca. Mouth behind middle of body. A single genital pore present. Generally elongate and flattened or sub-cylindrical forms, including the families Bdellurídae, Procerodidae (marine), Planariidae (fresh-water), Geoplanidae, Bipaliidae (terrestrial) and several others.

Order III. Polycladida. Intestine consists of a central sac giving off laterally a number of branching caeca. Genital pores typically separate. Flattened and generally leaf-like marine forms.

Tribe 1. Acotylea. Without a ventral sucker. Mouth at or behind middle of body. Genital pores near posterior end. Tentacles, if present, dorsal. Includes the families Planoceridae, Leptoplanidae, etc.

Tribe 2. Cotylea. A sucker present behind the genital pores.

Mouth at or in front of middle of body, with genital pores just behind it. Tentacles, if present, marginal. Includes the families Pseudoceridae, Euryleptidae, etc.

The group Temnocephaloidea (consisting of *Temnocephala* and certain other peculiar genera epizoic upon fresh-water crayfish, tortoises, etc.) has sometimes been given the rank of a fourth order, and looked upon as connecting the Turbellaria with the Trematoda (*q.v.*).

In the classification proposed by Poche, to which reference has been made above, the three main groups are: Acoela (order Proporidea), Rhabdocoeloinei (orders Planariidea, Catenulidea, Rhabdocoela, Temnocephalidea) and Polyclada (order Planoceridea). The Acoela are thus removed from the Rhabdocoelida, and the remainder of the latter, with the Tricladida and Temnocephaloidea of the old system, included in one large group.

Occurrence and Habits.—Most Turbellaria are aquatic. They are abundant on the seashore and in fresh water, where they lurk among weeds or under stones, and in the crannies of rock-pools. The marine forms usually emerge from their hiding-places only during high tide to feed. These worms creep with a curious gliding movement, aided by their cilia, or swim actively. Some of the small fresh-water planarians may often be seen creeping upside-down on the surface-film of the water. Many species of triclads are terrestrial. These occur in damp localities and chiefly in tropical or subtropical countries, though a few are known in temperate latitudes. They are somewhat slug-like in form and habits. A few Turbellaria are parasitic. These are marine, and are found in such animals as sea-urchins, holothurians and molluscs. The free-living forms are almost all carnivorous, feeding either on microscopic organisms or on worms, molluscs and insects. The protrusible pharynx is used either to engulf the prey whole or to pierce it and suck up its juices after it has been enveloped in a coating of mucus.

Development and Life-history.—The development of most of the Turbellaria is direct (*i.e.*, without metamorphosis). In certain polyclads, however, the embryo develops into a swimming larva ("Müller's larva") provided with eight ciliated lobes, and somewhat resembling the trochosphere larvae of certain annelids. In the Rhabdocoela the eggs are generally enclosed in shells, each being provided with a number of separate yolk-cells. In the Acoela and Polycladida the ova themselves may contain yolk-granules, and the eggs are usually laid in clumps surrounded by a gelatinous envelope. The ova of triclads are laid, several together, surrounded by amoeboid yolk-cells, in a cocoon, and only a certain proportion of them develop, the others being used as food-material by the survivors.

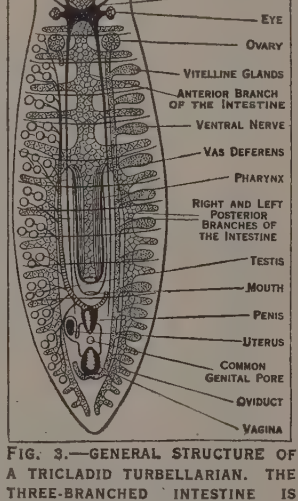

FIG. 3.—GENERAL STRUCTURE OF A TRICLADID TURBELLARIAN. THE THREE-BRANCHED INTESTINE IS CHARACTERISTIC OF THIS GROUP

A form of asexual multiplication occurs in certain rhabdocoels (Microstomidae) and triclads. In the former the body becomes constricted in the middle and forms two complete animals, each of which again subdivides, and so on, until a whole chain of individuals is formed, head to tail, eventually breaking up into separate organisms. In some of the triclads spontaneous fragmentation may occur, with regeneration of the parts to form complete animals. But even forms which at one season reproduce in this manner, do so at another by means of eggs. In certain rhabdocoels (e.g., *Mesostoma*) two distinct types of eggs are produced according to the season. During warm weather the eggs laid are thin-shelled "summer eggs" which develop rapidly, while thick-shelled "winter eggs," whose contents remain longer in a resting condition, are laid in cold weather. In other cases the eggs are apparently similar at all seasons, but develop more rapidly in wa water than in cold. Thus in shallow pools subject to sudden a frequent changes of temperature, the population increases rapi during warm weather, while during cold spells the survival the race is assured. (*See* PLATYHELMINTHES.) (H. A. B.)

TURBERVILLE (or TURBERVILE), **GEORGE** (1540 1610?), English poet, second son of Nicholas Turberville of Wh church, Dorset, belonged to an old Dorsetshire family, t D'Urbervilles of Thomas Hardy's novel, *Tess*. He became scholar of Winchester college in 1554, and in 1561 was made fellow of New college, Oxford. In 1562 he began to study l in London, and gained a reputation, according to Anthony Wood, as a poet and man of affairs. He accompanied Thom Randolph in a special mission to Moscow to the court of Iv the Terrible in 1568. Of his *Poems describing the Places a Manners of the Country and People of Russia* (1568) mention by Wood, only three metrical letters describing his adventu survive, and these were reprinted in Hakluyt's *Voyages* (158 His *Epitaphs, Epigrams, Songs and Sonets* appeared "newly c rected with additions" in 1567. In the same year he publish translations of the *Heroycall Epistles* of Ovid, and of the *Egl* of Mantuan (Gianbattista Spagnuoli, called Mantuanus), and 1568 *A Plaine Path to Perfect Vertue* from Dominicus Mancin The *Book of Falconry or Hawking* and the *Noble Art of Vene* (printed together in 1575) may both be assigned to Turbervi He probably died before 1611.

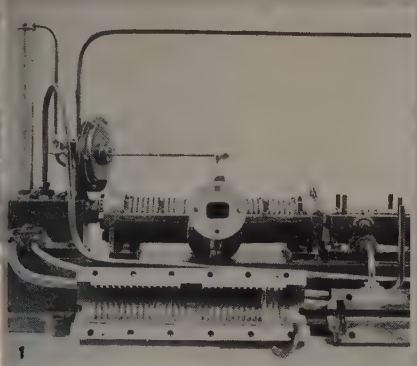
TURBET I HAIDARI, a town in the province of Khuras in Persia, situated at an elevation of 4,400 ft., about 76 m. S. Meshed, on the motor road to Duzdab, via Qain and Birja A centre of many roads, the town is surrounded by a dilapidat bastioned wall, but the better houses are found outside. In t north-east are the ruins of an old citadel, or the Ark of Ish Khan; but the principal feature of the town is its bazaar form of four dome-vaulted streets radiating from a larger central do Before the famine of 1871, Turbet i Haidari was populous, b the population was, it seems, reduced by 20,000. The town h recuperated before the World War owing to increased trade b tween Russian Turkistan and Afghanistan; since then there h been a decline and the latest estimate (1900) gives a populati of 5,000 only, chiefly of Turki Qarai stock, who were settled th by Timur in the 14th century; but many of the merchants a artisans are Yazdis. The surrounding district is very fertile a much wheat and barley are sent to other parts. The chief tradi activities are wool-buying, silk production (now greatly declinin carpet buying from the Baluch nomads round about, and t making of copper utensils.

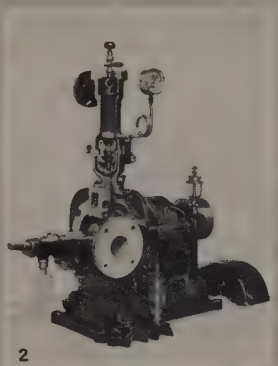
The town, formerly known as Zavah, derives its name from t *turbeh*, or tomb, of a holy man named Qutb ud Din Haidar, t founder of the ascetic sect of dervishes known as Haidaris, w died *c.* 1230 and is buried in a domed building just outside t town.

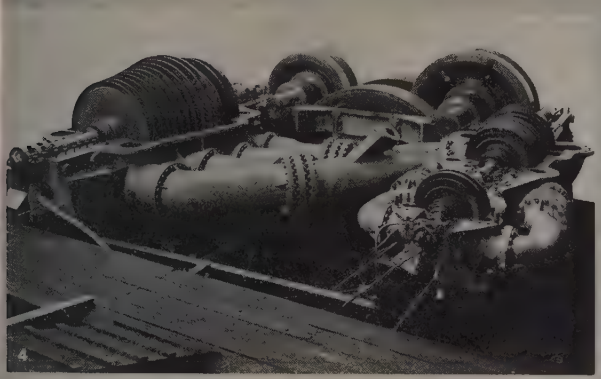
TURBINE: STEAM. A turbine is a rotary motor which the shaft is rotated steadily in its bearings, not by mea of cranks as for example in a reciprocating engine (*q.v.*), but a current of water, air, steam or any other fluid. Thus a stea turbine is a "prime mover" which generates motive power in t same manner as the familiar country-side "wind mill," which used for grinding corn or pumping water. Instead of a curre of air being used to rotate the shaft by means of "sails" as in "windmill," a current or blast of steam issuing from a numb of fixed nozzles, is employed to rotate the shaft of a stea turbine by means of "vanes," "buckets" or "blades."

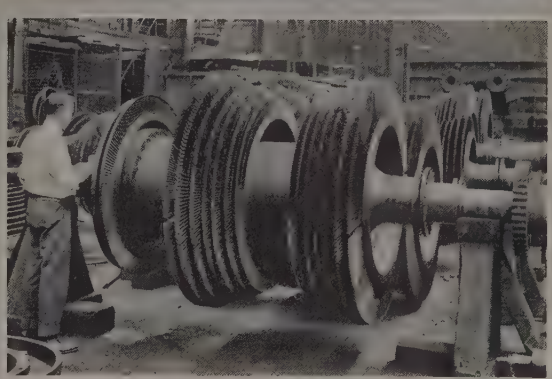
The relatively small power obtainable from the wind with reasonable sail area, and the discontinuity of the breeze, ren the windmill of comparatively little economic importance, b with the steam turbine on the other hand, the matter is ve different. Not only is there the convenience of uniform rota motion applied to a shaft direct, but also the powerful and u failing steam blast generated with coal or oil fired boilers, a the enormous power output obtainable from a turbine of ve moderate dimensions.

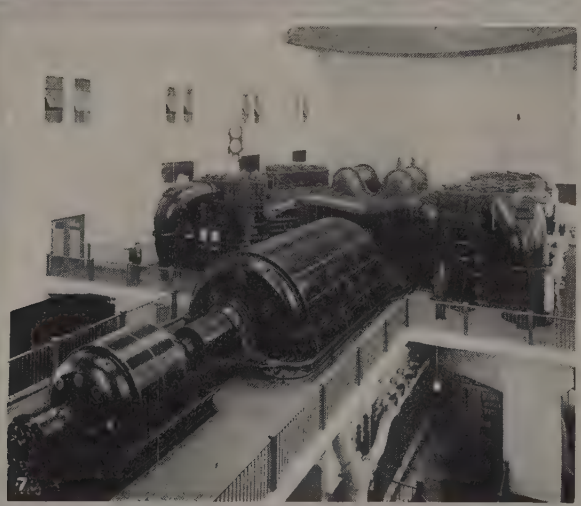
The economic value of the steam turbine has, therefore, be











BY COURTESY OF (1) SIR CHARLES A. PARSONS, K.C.B., F.R.S., (2, 3) THE SCIENCE MUSEUM, LONDON, (4, 5) THE MARINE ENGINEERING AND SHIPPING AGE, (6, 7) THE GENERAL ELECTRIC COMPANY (U.S.A.)

DEVELOPMENT OF THE STEAM TURBINE

1. Parsons' original 10 h.p. steam turbine with top of casing removed. Built in 1884, this type, by the utilization of Parsons' principle of "pressure compounding," opened up an unlimited field of utility for the steam turbine. The original is in the Science Museum, London
2. De Laval steam turbine built in 1889, after several years of preliminary research. Sectional view reveals the single wheel, about 5 in. in diameter, which rotated at approximately 30,000 revolutions per minute
3. Model of Ratean steam turbine built in 1896. Section shows internal construction
4. Engine of S.S. "Scythia," and the double, reduction geared turbine unit with top housing removed to show turbine rotors and gears. It is designed to develop 6,250 h.p. at the shaft
5. Turbine rotors in process of assembly at a large plant
6. General Electric 94,000 kilowatt tandem compound turbo-generator set at the Long Beach station of the Southern California Edison Company, Los Angeles. This view shows the high-pressure unit in the foreground with the low-pressure unit towards the rear, connection from one to the other being effected by means of the two steam headers shown
7. The turbo-generator of fig. 6 viewed from the generator end. The space underneath the unit houses the auxiliary equipment

ncentive to its development to the utmost, and its evolution een carried out in the face of all obstacles,—a story worthy a epic of mechanical engineering—for many years almost ly owing to the efforts of the Hon. Sir Charles A. Parsons, , K.C.B., etc., and his associates and in more recent years by t of other workers as well.

neral Mechanical Features.—In the steam turbine, in a pure twist or driving torque is the only force applied to haft, the entire mechanism may be described under the fol- g six headings.

. The system of "blading" by means of which the motive power oduced. The term "blading" (as distinct from "blades") is used to e collectively the fixed nozzles and the rotating "vanes" or es."

. The rotating shaft, or "rotor," which carries the rotating ele- of the blading, and collects and transmits the driving torque.

. The casing, which carries the nozzles or fixed elements of the ing," balances or provides the reaction to the driving torque orque tube in a motor car), and embodies the supports or bear- or the rotor.

. The speed regulating mechanism.

. The lubricating system for the bearings.

. The coupling between the rotor and the apparatus intended to iven by it.

e blading may consist of a set of fixed nozzles (*see* fig. 1) cing high-velocity steam jets on to "vanes" or "blades" ted round the rim of the l. If there were no blades her obstructions in front of team jets, the latter would l forward in a straight line. curved surfaces of the blades, ver, forcibly deflect the jets the free path, the blades selves receiving in conse- ce an "impulse" in the direc- opposite to the deviation h they produce. Hence the "impulse turbine" applied turbine of this kind. The n jets in passing through the passages and doing work on the wheel, will be continuously ed down and will leave the moving blades with a velocity t less than the initial.

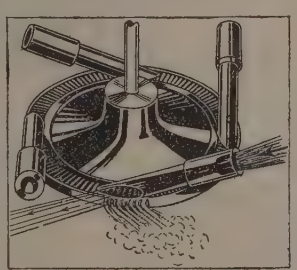


FIG. 1.—DE LAVAL WHEEL AND NOZZLES SHOWING DEVIATION OF THE STEAM JETS BY THE BUCKETS

ecial Difficulty of the Problem.—Such a very simple ar- ment (the counterpart of the well-known Pelton water l for utilizing waterfalls) although widely adopted for small rs, is not applicable to large powers.

e underlying reason for the unsuitability of the simple steam- l as compared with the water wheel is to be found from a arison of the physical properties of steam and water. Water in-elastic fluid; that is, it has practically the same density ght per cubic foot) at all pressures, and in a water turbine, vater jet velocity generated by a given fall in pressure is de- ined from the static head corresponding to that pressure. If h e height of a column of water, the difference of pressure een the top and the base of the column is that due to the ht of the water in the column pressing on an area equal e sectional area at the base. Denoting this sectional area by en hA=the volume of the water, the weight of the column A, and p, the pressure per unit area at the base, $=\rho h$ where the density or weight per unit volume.

e jet velocity due to such a head of water is the same as acquired by a body falling freely through the height h under ity viz., $\sqrt{2gh}$ thus $V^2=2gh=2g\left(\frac{p}{\rho}\right)$. Each pound of water ing in at the top of the column and discharged at the base velocity V has lost potential energy gh and gained an equiva- amount of kinetic energy $\frac{1}{2}V^2$. This is the energy per pound h would be available for use in a water turbine.

e static head of water corresponding to a pressure of 265 er sq. inch would be 610 feet and the velocity due to this 198 feet per second.

ith a fluid of less density, a longer column would be re- quired in order to have the same pressure at the base. In other words the same pressure would then correspond to a greater static head. Considering steam at, say, 265 lb. per sq. inch and a temperature of 700° F, the density of the steam is $\frac{1}{16}$ of that of water and it would therefore require at that density a column 160 times the height to give the same pressure, or $160 \times 610 = 97{,}600$ ft. But this is not all. Steam, in contrast with water, is a highly elastic fluid, and the effective head in steam would be even greater than 97,600 ft., because of the expansion in volume which takes place as the pressure falls. During this process, successive decrements of pressure, associated with successively decreased density, contribute increasing amounts to the static head (figure 2c.). As a consequence of the expansion the fluid cools down considerably, and the actual head is therefore the height of a column of steam at varying density (and temperature); the pressure at any point of the column is that due to the weight of the steam above it and the density at that point is the density corresponding to such pressure. Such a column of steam with a pressure at its base of 265 lb. per sq. inch and a pressure at the top of $\frac{1}{2}$ lb. per sq. inch (measured from zero pressure or an absolute vacuum) would have a height of 365,000 feet. (It should be noted that pressures measured from zero pressure [or an absolute vacuum] are designated absolute pressures. A pressure below atmospheric is expressed either as an absolute pressure or as a vacuum, by which is meant the defect below atmospheric pressure. Thus if the barometer reading is 30″ of mercury then a perfect vacuum would be called a vacuum of 30″ of mercury; and a vacuum of, say, 28″ of mercury is less than a perfect vacuum by the pressure corresponding to 2″ head of mercury.) This therefore is the value of the effective static head of steam when allowed to expand between these pressures.

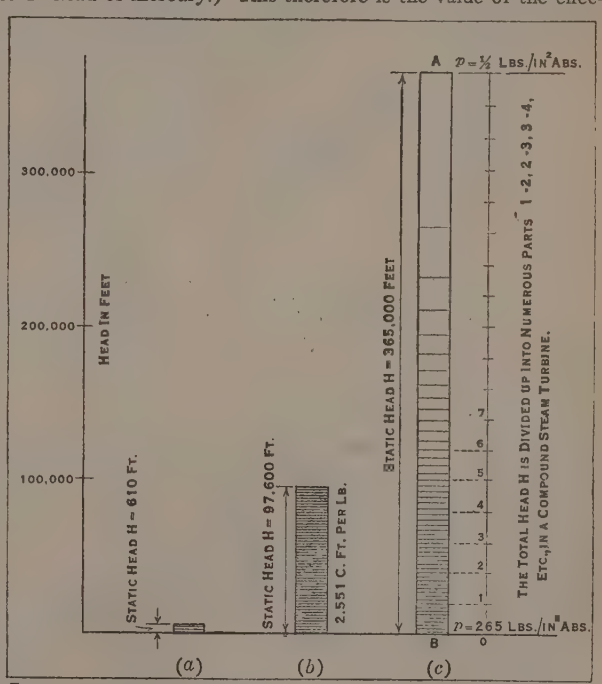

FIG. 2.—COMPARISON OF WORKING "HEAD" FOR A WATER TURBINE AND A STEAM TURBINE RESPECTIVELY

Thus the static head h of an expanding fluid can be considered as the height of a column of the fluid at its natural density, that is to say, of a density diminishing from the base upwards just in the same manner as the atmospheric pressure decreases with altitude.

The potential energy gh is then available as before (*i.e.*, as in the water turbine) for conversion into kinetic energy $\frac{1}{2}V^2$ of the resulting steam jets. The velocity corresponding to a head of 365,000 feet, however, is 4,800 feet per second, and it can easily

be understood therefore that a construction suitable for utilizing the energy of water jets with a speed of 198 feet per second is not suitable for steam in which the available energy per pound corresponds to a jet speed of 4,800 feet per second.

Figure (2) is a diagrammatic comparison of the effective static heads above considered, shown as columns of fluid having a pressure of 265 lb. per sq. inch at the base. (a) shows the height of such a column of water, (b) that of a fluid at the uniform density which steam has at 265 lb. per sq. inch pressure, and (c) that for steam at its natural density.

Actually, of course, the head of steam for a steam turbine is not obtained by means of a vertical column, but by generating steam under pressure in a boiler.

This does not alter matters, however, for imagine a steam boiler, generating steam at 265 lb. per sq. inch absolute, to be connected to the base of the column (c) in figure (2). Then evidently the steam will rise up the column, falling gradually in pressure and temperature just as it would do in a turbine, and at an altitude of 365,000 feet it would leave the top of the column as exhaust steam at ½lb./in². absolute (assuming the external atmosphere absent). Where has the energy originally in the high pressure steam gone? Clearly it is in the gravitational potential energy of the steam raised to the top of the column. In whatever manner the head is generated, the stored energy per pound of fluid is the same. This energy, namely Sum $\frac{p}{\rho_1}$ has been calculated for steam from an experimental knowledge of its properties, and is tabulated for the use of engineers: it is, however, usual to express it in heat units instead of mechanical units, the two being strictly equivalent. (*See* THERMODYNAMICS.)

Table I. gives the theoretical values for the velocity attainable by allowing high pressure steam to escape through a suitably shaped orifice or nozzle, to a place at lower pressure.

The Simple Steam "Windmill" of de Laval.—The practical difficulty in utilizing such high velocity steam jets efficiently in a "simple" steam turbine will soon be apparent. Simple mathematical theory shows, and experiment confirms, that the proportion of energy in a jet of steam which can be converted into useful work on the turbine shaft, depends mainly on the relation which is made (by the designer) to exist between the linear velocity C_1 of the "vanes" or "blades," and U that of the jets impinging on them. In other words, the efficiency of a turbine depends mainly on the ratio called the "velocity-ratio," $\frac{U}{C_1}$, usually denoted by the symbol α. Figure 3 shows a curve (A) of the "blading" efficiency obtainable from a "simple" turbine of the type shown in figure (1). Losses due to windage, eddies and friction in the turbine itself, and to friction of bearings, etc., will absorb some of the power developed, so that the "brake" efficiency at the driving end of the shaft will be considerably less.

Here it may be noted that the expression "efficiency of a turbine" must be carefully understood, as it is liable to misinterpretation. If the energy of the steam jet is, say A units of work and out of this the turbine usefully delivers B units to the coupling at the driving end, then the brake efficiency of the turbine is $\left(\frac{B}{A}\right)$. A however, may have very different val according to the steam conditions. The more favourably ch the steam conditions are, the greater fraction A may be m of the total latent energy E in a lb. of coal or oil fuel.

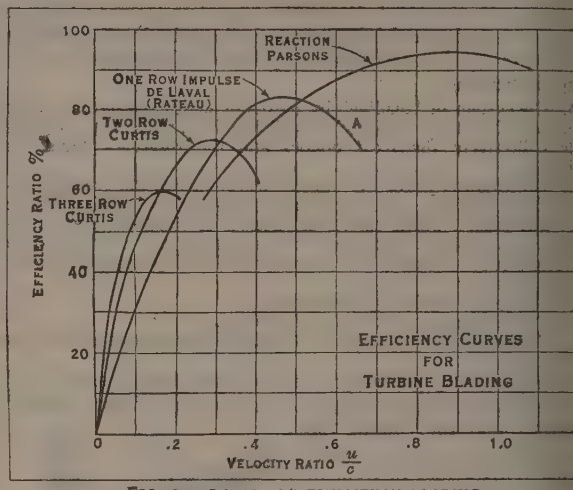

FIG. 3.—CURVES OF EFFICIENCY BLADING

other words, the net efficiency of the whole plant (boilers turbine) is $\frac{A}{E} \times \frac{B}{A} = \frac{B}{E}$. The important point to be realize that whilst $\frac{B}{A}$ may be and generally is, in a large modern turb about 85%, on the other hand $\frac{A}{E}$ does not even in the very plants exceed about 36·0% so that the overall efficiency is ab (0·36 × 0·85) × 100=30·5% from fuel to brake horse po This comparatively low figure is not due to imperfections in plant owing to incorrect design, but to a fundamental law thermo-dynamics which places a limitation on the thermo-dyna efficiency of any engine, however perfect, designed to con the heat of fuel into motive power. For further information u this aspect of the problem of the utilization of the heat en in fuel, *see* THERMODYNAMICS.

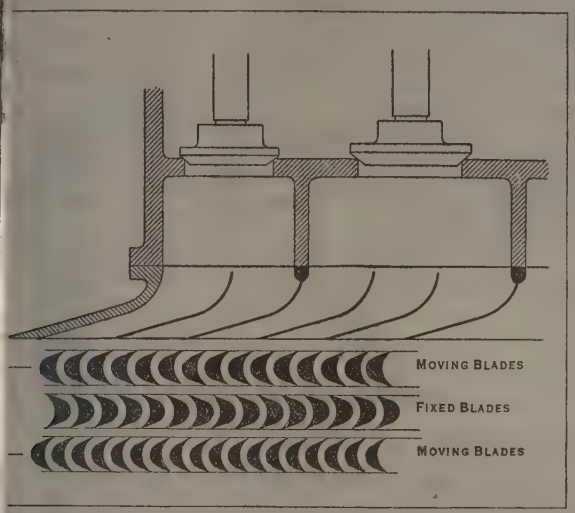
To resume, it will become apparent from fig. 3 that the efficiency for this type of blading is obtained at a "veloc ratio" of about 0·45, that is to say, when the velocity of blades is about half the velocity of the steam jets. Referrin Table I. it will be observed that with an ordinary boiler p sure of, say, 175 lb./in.² absolute, and a final exhaust pres of 1 lb./in² absolute, the jet velocity is of the order of 4,000 per second. If the blade velocity is to be 0·45 of this, it wil about (0·45 × 4,000)=1,800 ft. per sec.

The centrifugal forces on a turbine wheel and blades opera at this mean blade velocity will be very great, and the co quent centrifugal stresses also. A rim speed of 1,800 feet per would be that of a 10″ wheel revolving at 41,000 revoluti per minute. The maximum stress in a disc at this speed wo be of an order which is not practicable so that a turbine con ing of a single wheel can only have a poor velocity ratio, an only suitable for small outputs for which efficiency is of second importance. The speed of revolution is necessarily high, such turbines have therefore to be coupled to the machines t drive through some form of speed-reducing gear, usually of mechanical type, with double helical gear wheel teeth.

The "simple" type of steam turbine or steam "windmill" first perfected by the great Swedish Engineer Gustav C. P. Laval in 1887 after several years of preliminary work. It ra as a great achievement inasmuch as, within the limitations described, it is a perfectly practical solution of the probl worked out moreover in days when reliable data on the pro

of steam were practically non-existent.

elocity Compounding of Steam Turbines.—If the mean e speed of a simple steam "windmill" such as the de Laval, ss than about half the circumferential velocity of the steam the latter will not be slowed down sufficiently in the space wing the moving blades, and some of their energy will be ed. In other words, the velocity of the steam will not be



IG. 4.—VELOCITY COMPOUNDING—NOZZLES AND MOVING BLADES

inimum. In order to provide means for recovering the energy ne residual velocity, about the year 1898, Curtis developed in United States of America a system known as "velocity com- nding." In this arrangement he fitted additional guide blades e-direct the steam on to further rows of moving blades. ure 4 illustrates a series of such additional rows. The char- ristic feature is that the fall in steam pressure is confined to nozzles, the steam flowing through the remaining blades at tant pressure, but with ever diminishing velocity, because he energy absorbed by the wheel and transmitted to the tur- coupling. It might be supposed these rows could be made ciently numerous to extract the whole energy economically single pressure stage, *i.e.*, that pressure compounding would nnecessary. Unfortunately, however, reversal of the direc- of the motion of steam at high velocity is accompanied by of energy and this, together with frictional losses, soon im- s a limit to the number of reversals which can be efficiently loyed. The "two-row" Curtis wheel has been employed ly but the 3-row Curtis wheel is so inefficient that it is now om used except in small auxiliary turbines or sometimes in ine astern turbines where efficiency is less important.

arsons' Master Principle of "Pressure Compounding."— application of steam turbines on these lines could never, ng to the limitations described above, become general, and master invention which has opened up an unlimited field of ity was supplied in 1884 by Sir Charles A. Parsons.

he high efficiency already attained by water turbines (*q.v.*) rating under very moderate "heads" of water, made it seem im possible that if a number of "simple" one wheel steam tur- es were placed in series on the same shaft, one turbine exhaust- its steam into another, and so on, it would be practicable to ide up the energy of expansion of the steam over a number of h "elementary" turbines so that the effective "head" of steam other words, the amount of expansion) in each would be small. hus, since the velocity of efflux of the steam jets in each mple" turbine of the series would be correspondingly reduced, latter would operate under conditions more analogous to the er turbine, that is with moderate and practical blade speeds, conjunction with high "velocity-ratio" and high efficiency.

his fundamental concept was subjected to practical test by rsons in a turbine of his own design at Gateshead-on-Tyne, gland, in 1884, and has since proved to be the only solution. In fact, this principle of "pressure-compounding" or using several "simple" turbines in series is an essential feature of *all* modern steam turbines of large output and high economy, because it permits reasonable blade velocities to be adopted, without sacrifice of efficiency. (Parsons' original 10 h.p. steam turbine and dynamo may be seen in the Science Museum, South Kensington, London.)

Application of Parsons' Principle.—The application of this principle may best be grasped by considering its application (at

a later date) to the simple turbine of de Laval. Figure 5 gives a diagram of a modern turbine of this kind, associated chiefly with the name of Rateau, who developed it from about the year 1896. The turbine consists of a series of de Laval wheels or steam "windmills" all mounted on the same shaft, each wheel being placed in a compartment. High pressure steam is admitted to the first wheel of the series through suitable nozzles. (Figure 6.) In the partition dividing the first wheel from the second wheel there is a second set of nozzles so proportioned as to maintain a suitable back pressure in No. 1 compartment and not allow the steam to escape from it too freely. By thus limiting the drop of pressure from boiler pressure to that in the first compartment, the steam velocity generated in the first set of nozzles can be adjusted to any desired value and consequently also the resulting jet velocity.

The passages which form the exhaust or exit ports from the first wheel are actually nozzles delivering the steam in the form of jets on the second wheel of the series. In the succeeding wheels the same procedure is followed over and over again, the initial steam pressure being thus reduced by appropriate steps until finally the exhaust at exit pressure is reached in the last wheel. From a correct knowledge of the properties of steam and of the losses which occur due to friction and eddies, it is possible to choose the proportions of the nozzles so that every wheel of the series operates at a proper velocity-ratio.

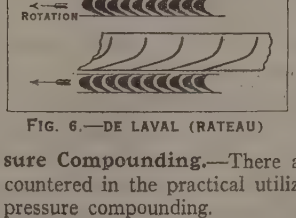

FIG. 6.—DE LAVAL (RATEAU)

Difficulties Attending Pressure Compounding.—There are certain unavoidable losses encountered in the practical utilization of the Parsons principle of pressure compounding.

It will be seen from fig. 5 that there are places in a "compound" turbine where serious leakage can take place, viz. round the periphery of the shaft where it passes through the "diaphragms" separating one wheel from another, and also at each end of the shaft where it passes into the outer atmosphere.

The necessary surface speeds in successful steam turbines are so high that generally speaking leakage cannot be entirely stanched

by any form of packing which involves actual rubbing contact, on account of the great frictional heat that would be generated. It follows therefore, that such leakage, if it cannot be altogether suppressed, must be reduced to a minimum by the use of fine working clearances. Thus all compound turbines, of whatever design, have fine clearances in certain parts, such fine clearances being essential to steam economy.

The early pioneer work of Sir Charles Parsons was carried out against considerable obstacles. For 13 years after 1884, no notice whatever of his efforts was taken on the continent of Europe.

In dealing with the problem of the reduction of steam leakage, Parsons originated two principles, namely, that where the relative motion between two surfaces is very great and it is desired to limit the fluid or gaseous leakage between them as between the rotating shaft and the fixed casing,

(1) One of the surfaces should be provided with thin edges or so-called "contacts";

(2) Both surfaces must be serrated, *i.e.*, given an interrupted contour in the direction of the pressure gradient.

The first is necessary in order to make it possible to limit the leakage area through which steam can escape, that is to say, to enable the two surfaces to be run close up to one another at suitable points, without danger of irreparable damage, in the event of accidental contact.

The second is necessary in order to limit further the leakage by compelling the steam to flow in a tortuous path.

In another well-known form of packing, which is said to have been originated much later in Germany, rings of graphite or carbon are placed round the shaft. Each ring is cut up into several segments, and all are held together by a "garter" spring. A pin projects into the fixed turbine casing on one side in order to prevent the carbon ring being carried round with the rotating shaft. The carbon ring does not actually seal the shaft against all leakage; if it pressed sufficiently hard on the shaft to do so it would rapidly become overheated, as explained above. In practice, the length of the individual segments is made such that when they are pressed together butt and butt by the garter spring they are just clear of the shaft, and a thin film of leakage steam separates them from actual contact.

Parsons' Compound Reaction Steam Turbine.—Althou Parsons' master principle of pressure compounding has since introduction been applied to all types of modern efficient turbir there is another distinctive feature of design which he introdu in 1884 and which renders his steam turbine different from others, with the one exception of the Ljungstrom (1912). T feature (*see* fig. 7) is the use of blades which give a nozzle sha to the spaces between them in both the fixed and rotating e ments of the turbine (fig. 8). In the modern "reaction" t bine, in fact, the efficiency of the "blading" is practically equal that of well-formed nozzles. It has therefore a higher intrin efficiency than "impulse" blading, because in the latter there losses due to friction in the moving blades in addition to losses in the nozzles.

As will be made evident later, in a Parsons reaction turbine, function of the fixed nozzles is bring the steam jets smooth into the moving nozzles and turbine is driven or rotated most entirely by the reaction the steam jets issuing from moving nozzles. Hence the na "reaction turbine." This reacti is analogous to that of machi guns. The moving blades the selves in a reaction turbine re resent the guns which receive continuous backward "kick" "reaction" from the shots fired from them, causing them to rec in the opposite direction.

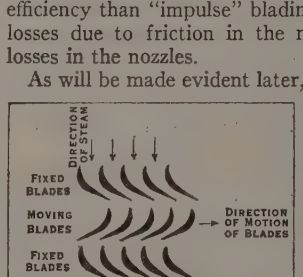

FIG. 8.—DIAGRAM SHOWING REACTION BLADING

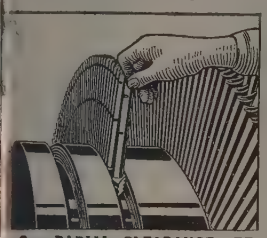
Features of Reaction Blading.—A further source of leaka occurs in the reaction turbine from the fact that the rotati blades are themselves nozzles, so that there is a drop of pressu in them just as occurs in the fixed nozzles or "guides." Steam w therefore tend to leak past the clearances of each. To minim this, many makers prefer to use the Parsons practice of 190 in which the tips of the blades are thinned down almost to a fi edge, so that fine radial clearances can be used without risk serious damage in case of accidental contact (*see* figs. 9, 10

ne most modern form of Parsons reaction blading however is
n in fig. 10. This is known as "end-tightened" or axial-
ance reaction blading. It will be seen that the clearance in the
al direction is large, giving mechanical safety. The blades are
d with shrouding having an overhanging sharp edge in close
imity to the roots of the blades of the adjacent row. The
clearances between the edge of the shrouding and the blade-
s are adjustable by endwise motion of the rotor, and be-



9.—RADIAL CLEARANCE—RE-
ON BLADING

cause of the positive nature of the control of the end-position of the "rotor" by the thrust block, the axial clearances can be made small with greater safety.

Another feature of reaction blading, due to the pressure drop over the moving blades, is the evident existence of an unbalanced steam thrust on every row of the latter. There is also a steam pressure gradient along the
r so that this also contributes to a resultant steam thrust on
rotor and its blading of considerable magnitude in a direction
n the turbine, *i.e.*, towards the exhaust end. This resultant
st may amount to several tons and may be too heavy to carry
ely on the thrust bearing. Parsons therefore uses dummy pis-
to balance the end thrust by receiving steam pressure in
opposite direction. One such piston could be made to balance
whole, but in order to ensure proper control of the end pres-
at all loads and under all conditions it is usual to use two
nore dummy pistons, each connected to that portion of the
r blading which it balances, by means of large bore equalizing
s. Sometimes the low pressure dummy piston is omitted and
residual end thrust carried by the thrust bearing. This prac-

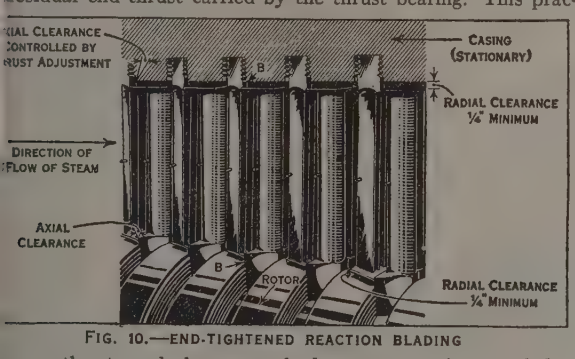


FIG. 10.—END-TIGHTENED REACTION BLADING

saves the steam leakage past the low pressure piston and thus
roves the economy.

jungstrom Compound Reaction Steam Turbine.—With
exceptions, modern turbines are built as axial-flow turbines
horizontal shafts. In the Ljungstrom turbine, a construc-
al peculiarity is that the steam is made to flow radially out-
ds. In addition, instead of having alternate rows of fixed and
ing blades, the guide nozzles are themselves allowed to rotate,
in the opposite direction, so that it is the same in effect as if
casing of a Parsons turbine were allowed to revolve in a direc-
opposite to that of the shaft or rotor. The blades are attached
oncentric rings to two discs, mounted on shafts with a com-
horizontal axis, revolving in opposite directions, and driving
arate dynamos.

Differences Between Impulse and Reaction Turbines.—
names "impulse" and "reaction" turbines mentioned above,
more popular than scientific, and it is important to possess a
r idea of the fundamental constructional difference in design
ch places a turbine in one or other category.
comparison of the longitudinal section of a modern axial-flow
izontal impulse turbine (fig. 5) with that of a similar modern
ction turbine (fig. 7) shows that speaking generally the former
haracterized by the presence of definite compartments or cells
which each row of blades revolves, while in the latter the compartments are virtually non-existent. This difference, however, is a matter of expediency for the particular type of blading adopted, and is not a matter of fundamental design. There is no theoretical reason why impulse blading should not be arranged on a barrel like the reaction blading in fig. 7, or why reaction blading should not be arranged with diaphragms and wheels like the impulse blading in fig. 5. This is an important point to be borne in mind.

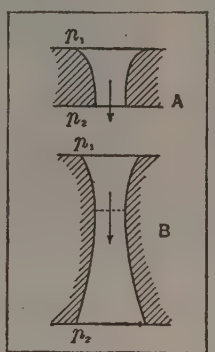

FIG. 11.—(A) CONVERGENT NOZZLE PASSAGE AND (B) WITH DIVERGENT OR TRUMPET-SHAPED MOUTHPIECE ADDED

If it is not enough merely to say: "this turbine has nozzles in diaphragms followed by a row of buckets, therefore it is an impulse turbine," and "that turbine has no diaphragms but has nozzles in both fixed and moving elements, therefore it is a reaction turbine." The further question arises: "What are the essential characteristics of nozzles, and in what way do buckets or vanes or blades differ from them?"

The fundamental constructional difference lies in the shape of the steam passages or paths between the blades or vanes which are used. The nozzles used in steam turbines to produce the propelling steam jets are always the same in principle, although they may differ considerably in their proportions. There is, that is to say, always a narrowing or "convergent" passage connecting a region of higher steam pressure with a region of lower steam pressure, the change in cross section of the passage (fig. 11a) being made gradual in order to obtain high efficiency of conversion of pressure-energy into kinetic or velocity energy.

The nozzle may have a divergent extension or "mouthpiece" as in fig. 11b and in turbine design has to be "skewed" at an angle to the plane of the wheel, as in figs. 12a and 12b, but in every case the primary intent is to create a drop in pressure over the two sides of the boundary plate containing the nozzles, and to utilize that pressure drop to produce a steam jet. Having obtained the requisite steam jets, however, the buckets or blades on the rotating wheels are made with the fundamental distinction corresponding to "impulse" or "reaction" design respectively. If the blade-passages of the rotating wheels are "parallel" or nearly parallel (*i.e.*, non-convergent) as in fig. 13 the blading is of the "impulse" type, *i.e.*, nozzles followed by buckets. If they are passages of diminishing cross-sectional area (*i.e.*, convergent) the blading is of the "reaction" type, fig. 8.

Velocity Diagrams.—As a further aid to an understanding of these fundamental differences, study may be made of a useful graphic representation of the velocity and trajectory of the steam jets in their passage through the nozzles and blades.

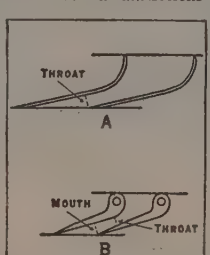

FIG. 12.—(A) SKEWED CONVERGENT AND (B) DIVERGENT NOZZLES

Figure 14a is what is known as a "velocity diagram" for impulse blading, in which "U," the mean circumferential velocity with which the blades are moving in front of the nozzles, is represented by BA. OA is the velocity "C," of the steam jet issuing from the nozzles. It will be seen that the blades are running away from the steam jets, so that if it were possible for an observer to be stationed at B (*i.e.*, going round with the blades) he would see the steam jets apparently coming in the direction OB. OB is, in fact, the relative velocity of approach with which the steam impinges on the blades, and the blade inlet angle at B would be made suitable to receive the steam approaching the blades in this direction.

Passing over the blade-surfaces, the steam jets are deflected out of their paths OA, and shoot off the tails of the blades with velocity CD relative to the blades, which, if frictional losses are neglected, is equal to the relative velocity of entry OB. But as the blades are themselves moving with velocity "U" or ED, the actual path taken by the steam jets at exit, relative to the fixed turbine

casing, will be CE.

It was mentioned previously that the best velocity-ratio for this type of blading is about 0·45; in other words the steam-jet velocity OA must be rather more than twice the mean blade-velocity BA. When this is the case, as will be seen from the diagram the steam finally leaves the wheel with axial velocity CE, which is evidently the minimum, for if it left in the direction C'E' (fig. 14b), it would evidently be greater. When CE is a minimum it is evident that the maximum energy has been extracted from the steam jets, and this occurs when $\frac{U}{C_1}$ is slightly less than one-half.

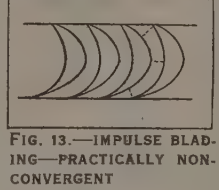

FIG. 13.—IMPULSE BLADING—PRACTICALLY NON-CONVERGENT

In Parsons' reaction blading, on the other hand, the best velocity ratio is about unity, that is to say, the mean blade-speed has to be nearly equal to the velocity of the steam jets. Thus OA (fig. 15a) represents the steam velocity. Circumferentially, this is equal to BA, the velocity with which the blades are running away from the steam-jets. To an observer at B therefore (moving round with the blades), the steam jets would appear to approach along OB, which is parallel to the axis of the turbine. Now this apparent or relative velocity of approach OB of the steam jets is quite small and further, being axial in direction, exerts no driving force on the moving blades. Hence the statement made that the function of the fixed nozzles is to bring the steam into the moving nozzles smoothly and without shock. Figure 15b shows the diagram when the velocity-ratio is too low.

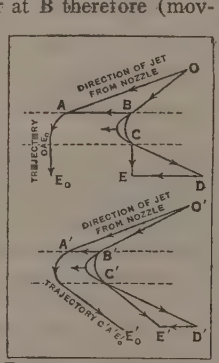

FIG. 14.—VELOCITY DIAGRAMS FOR DE LAVAL OR RATEAU BLADING
(A) Correct velocity
(B) Underspeeded

With either type of blading ("impulse" or "reaction") the ideal condition for theoretical maximum efficiency is reached when the steam leaves the moving blades with a relative circumferential velocity ED equal to the mean blade-speed BA, so that in relation to the turbine casing itself the actual velocity is a minimum, and the maximum energy has been extracted from the steam jets.

Combined Types of Turbines.—The velocity-compounded wheel of Curtis is frequently used for the first pressure stage of a turbine of which the succeeding stages are either of the compound impulse or of the compound reaction type. A two-row Curtis wheel displaces three or four de Laval wheels in series, or alternatively seven or eight pairs of nozzle rings of the Parsons reaction type. Although it has an inherently lower efficiency than single-row de Laval wheels or than reaction blading, its use has been justified by some designers on the grounds that at the high-pressure end of a turbine the efficiency of the latter is considerably reduced by steam leakages or windage losses, or both so that the net efficiency of the two-row Curtis is not much inferior.

Recently, however, in land turbines there has been a return to the use of the Parsons principle alone, the whole turbine, that is to say, being built up of simple pressure stages only (either of the de Laval or of the Parsons type), without any velocity-compounding.

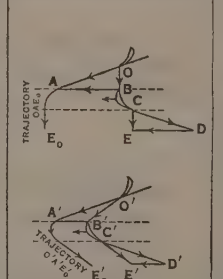

FIG. 15A, 15B.—VELOCITY DIAGRAMS FOR PARSONS' REACTION BLADING
(A) Correct velocity
(B) Underspeeded

The large number of such stages required for high efficiency led Parsons as long ago as 1899 to divide up the casing into two separate "cylinders" or separate turbines, coupled together in line and driving the same dynamo. Parsons used three separate cylinders in series on the steam-flow for the triple-shaft steam yacht "Turbinia" in 1897 (to be seen in the Science Museum, South Kensington, London).

In modern land practice for the generation of electricity on a large scale in central power-stations, the two-, or even four-cylinder turbine is widely used and in some continental exa even four separate cylinders have recently been adopted means of securing the highest efficiency, having regard t ever increasing initial steam pressures and temperatures tha now being favoured.

Present Position of the Steam Turbine.—Essentially a speed prime-mover, the steam turbine in the early days of i velopment was unsuited to drive machinery which must run moderate or low speed of revolution. Such machinery mig grouped under the following headings:—

(1). Direct current dynamos.
(2). Paper mills, Jute mills, Textile mills.
(3). Screw propellers for marine propulsion.

The development by Parsons in 1910 of the small double-h speed-reducing gears of de Laval, so as to be suitable for mitting large powers, has permitted complete freedom of with regard to speeds, so that the steam turbine can no applied to the driving of anything in which continuous r motion is required. The design of the earlier marine install was largely a matter of compromise between the high spe revolution required for the turbine and the much lower which was more suitable for the propeller. Since the introdu of mechanical gearing, the marine turbine has tended to be assimilated in type to the land turbine, the same condition high thermal efficiency, namely, high velocity ratios, high pressures and temperatures, and lowest possible exhaust pressures being equally applicable.

TURBINE: WATER. Modern hydraulic turbines ma divided into two classes, impulse, and pressure or reaction bines. Of the former the Pelton wheel, and of the latter Francis turbine or one of its modifications, are the only used in recent important installations.

In an impulse turbine, the whole head of the supply wat converted into kinetic energy before the wheel is reached. water is supplied to the wheel through a nozzle which deliv high velocity jet at atmospheric pressure on to the vane buckets mounted on the periphery of the wheel.

In the pressure or reaction turbine, the wheel or runner is vided with vanes into which water is directed by a series of vanes extending around the whole periphery. The water on lea these guide vanes is under pressure, and supplies energy part the kinetic and partly in the pressure form. In its passage thr the runner the pressure energy is utilized in increasing the tive velocity of flow between the vanes, and the water fi leaves the runner at the pressure obtaining in the discharge or draft tube.

In the earliest of these turbines, the Fourneyron, the guide v were inside the runner, and the water flowed outward. This followed by the Jonval turbine, in which the guide vanes

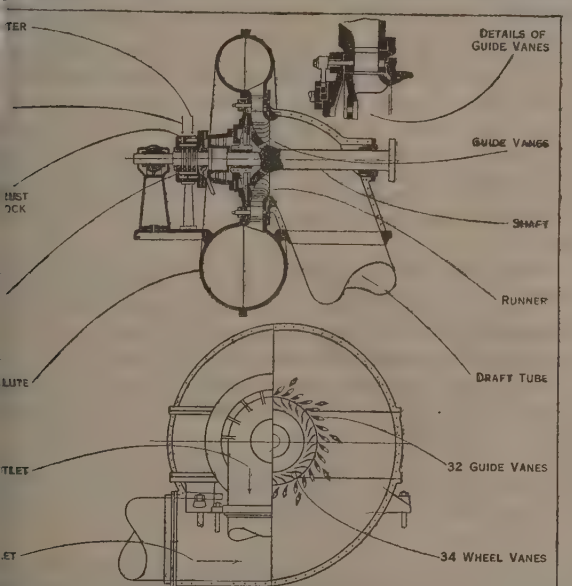
een the guide vanes. These are pivoted on stems which pro- through stuffing boxes in the turbine casing. Each stem car- a lever. These are all coupled to a regulating ring whose

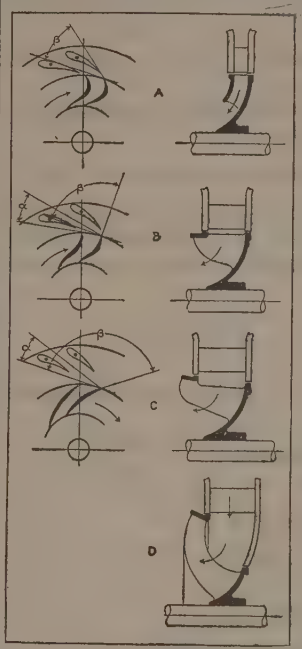


GIBSON, "HYDRO-ELECTRIC ENGINEERING" (BLACKIE & SON)

. 2.—DETAILS OF HIGH HEAD FRANCIS TURBINE WITH CAST IRON LUTE

tion is regulated by the governing mechanism, so that all the e vanes are opened or closed simultaneously.

t a low-head installation the turbine may be erected in the forebay or supply canal. This method has the disadvantage the guide-vane mechanism is submerged and cannot be in- ted or repaired without draining the wheel pit, and in most recent installations, even of the low-head type, the guide-vane ring is surrounded by a spiral volute chamber, from which the pressure water is delivered with uniform velocity around the entire periphery of the guide ring. For heads not exceeding about 100 ft., modern practice favours the moulding of the volute chamber in the concrete of the substructure (fig. 1). For higher heads, considerations of strength necessitate a metal casing, to which the water is supplied through a pressure pipe line (fig. 2). The turbine runner is usually of cast iron, although where corrosion or erosion is to be anticipated, it may be made of cast steel if large, and of phosphor bronze if small.



FROM GIBSON, "HYDRO-ELECTRIC ENGINEERING" (BLACKIE & SON)

FIG. 3.—TYPES OF TURBINE RUNNER

A. For high heads and comparatively low speeds. B. For medium heads and moderate speeds. C. For medium heads and high speeds. D. For low heads and high speeds

The general changes in the shape and proportions of the runner which have accompanied recent development of the low head high-speed turbine are indicated in fig. 3. The change has been generally in the direction of increasing the axial depth of the buckets, and at the same time of maintaining or increasing the ratio of the discharge area at exit to that at entrance. At the same time the width of the buckets in the direction of flow has been reduced. An extreme example is shown in fig. 3D, in which flow through the wheel itself is almost axial. In many recent low-head turbines the runners are of the propeller type. They are characterized by the fewness of the vanes, as few as three or four in many cases, and are in appearance very like the ordinary ship's propeller.

The Draft Tube.—In order to avoid the flooding of the turbine house by any raising of the tail race level in time of floods it is usually necessary to instal the turbines at some higher elevation, and if the turbines were provided with open discharge pipes, freely discharging into the atmosphere, the proportion of head represented by the elevation above tail water level would be lost. By arranging the discharge, or draft tube, so that the outlet is always submerged, it becomes possible, however, to place the turbine above tail water level without loss of head. The pressure at the point of discharge from the runner into the draft tube is now less than atmospheric by an amount which depends upon the elevation above tail water level.

The draft tube also, if well designed, serves a further purpose in that it enables a large proportion of the kinetic energy of discharge from the runner to be converted into pressure head, and so to be utilized. For this the tube must be designed with a gradually increasing diameter, so that the velocity is gradually reduced from v_1 to v_2 before discharge (fig. 1). The velocity of discharge from the draft tube should not exceed about 4 f.s.

Hydraulics of the Reaction Turbine.—In the following discussion let ω = angular velocity of the runner in radians per second ($\omega = 2\pi N \div 60$ where N = revolutions per minute); $u = \omega v$ = velocity of wheel at point indicated by a suffix; v = absolute velocity of water; w = tangential component of v; f = radial component of v; v = relative velocity of water and vane; α = guide vane angle; β = wheel vane angle at entrance; γ = wheel vane angle at exit; Q = flow in c.f.s.; W = weight of 1 cu.ft. of water; suffix (2) refer to inlet to wheel vanes; suffix (3) refer to exit from wheel vanes.

For entry without shock, the direction of the relative velocity

of water and vane at the entrance to the wheel must be parallel to the vane tips, and a consideration of the diagram of velocities (fig. 4) shows that if the angles are correctly proportioned:

$$f_2 = w_2 \tan\alpha = (w_2 - u_2)\tan\beta; \quad \therefore\ u_2 = w_2\left(1 - \frac{\tan\alpha}{\tan\beta}\right).$$

$$f_3 = (u_3 - w_3)\tan\gamma; \quad 2v_r = f_2 \operatorname{cosec}\beta; \quad 3v_r = f_3 \operatorname{cosec}\gamma.$$

The change of the moment of momentum in the wheel = turning moment $= \frac{WQ}{g}(w_2 r_2 - w_3 r_3)$ ft. lb.

$\therefore$ Work done per second on runner $= \frac{WQ}{g}(w_2 u_2 - w_3 u_3)$ ft. lb.

In an ideal wheel, with no friction or eddy losses, neglecting changes of level in the wheel, we should have

$$\frac{p_2}{W} + \frac{v_2^2}{2g} = \frac{p_3}{W} + \frac{v_3^2}{2g} + \text{work done per pound between (2) and (3).}$$

The efficiency will be a maximum when the energy rejected in the discharge is a minimum, *i.e.*, when v_3 is a minimum, or when w_3 is zero, in which case $v_3 = f_3$. Assuming the wheel to be designed for this state of affairs,

$$\frac{p_2}{W} + \frac{v_2^2}{2g} = \frac{p_3}{W} + \frac{f_3^2}{2g} + \frac{w_2 u_2}{g}.$$

Writing H as the head available to produce flow through the wheel, so that

$$H = \frac{p_2}{W} + \frac{v_2^2}{2g} - \frac{p_3}{W}, \text{ we have } H = \frac{f_3^2}{2g} + \frac{w_2 u_2}{g},$$

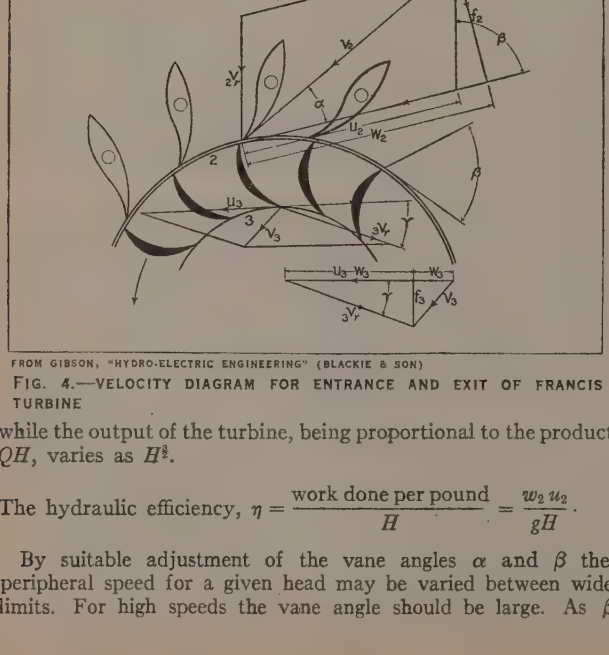
from which, writing $f_3 = f_2 \frac{b_2 r_2}{b_3 r_3} = w_2 \tan\alpha \frac{b_2 r_2}{b_3 r_3}$,

where b and r are the breadth and radius of the wheel, we get, on substitution,

$$w_2 = \sqrt{\left[\frac{2gH}{2 + \left(\frac{b_2 r_2}{b_3 r_3}\tan\alpha\right)^2 - 2\frac{\tan\alpha}{\tan\beta}}\right]}$$

while $u_2 = w_2\left(1 - \frac{\tan\alpha}{\tan\beta}\right)$, and $Q = A_2 f_2 = A_2 w_2 \tan\alpha$.

Thus in a wheel of given design, the peripheral speed for maximum efficiency, and the volume of discharge, each vary as $\sqrt{H}$,



FROM GIBSON, "HYDRO-ELECTRIC ENGINEERING" (BLACKIE & SON)

FIG. 4.—VELOCITY DIAGRAM FOR ENTRANCE AND EXIT OF FRANCIS TURBINE

while the output of the turbine, being proportional to the product QH, varies as $H^{\frac{3}{2}}$.

The hydraulic efficiency, $\eta = \frac{\text{work done per pound}}{H} = \frac{w_2 u_2}{gH}$.

By suitable adjustment of the vane angles α and β the, peripheral speed for a given head may be varied between wide limits. For high speeds the vane angle should be large. As β is increased the value of f_2 and hence the volume of water pass a wheel of given size diminishes, so that to obtain the same out the size of the wheel must be increased. If, as is usually the c in low-head plants, a high rotative speed is required, the inlet a is increased by increasing the depth of the runner. Such a turb has a comparatively large ratio of inlet area to discharge area, a the velocities of discharge are relatively high. For high heads may be between 60° and 90°, and, for medium and low hea between 90° and 135°. Similarly, while the hydraulic efficie decreases as α increases, the volume of flow increases with α, a the maximum output is obtained when the product of Q and η a maximum. For high efficiency α should be as small as mech ical considerations permit, generally between 12° and 18°.

In one modern turbine, the Kaplan, the wheel vanes are n fixed but are pivoted on a central drum, and their leading angle can be adjusted while running so as to suit any variations in working head or discharge. In this way a very high efficiency m be maintained at all loads.

Specific Speed of a Turbine.—In order to afford a basis comparison of turbines of different diameters and proporti operating under different heads, the term known as "spec speed" has been introduced. This may be defined as the speed which a runner would operate if reduced geometrically to suc size that it would develop 1 h.p. under unit working head. T figures for specific speed given below refer to a unit head o foot. If the metre be adopted as the unit, these figures require be multiplied by 4·45.

If N be the number of revolutions per minute,
„ P „ „ horsepower of the turbine,
„ H „ „ working head in feet,

the specific speed $N_S = \frac{N\sqrt{P}}{H^{\frac{5}{4}}}$ revs. per minute.

The specific speed of a reaction turbine may be varied by va ing the diameter of the runner, the angle of the guide vanes a the angle of the wheel vanes. By modifying the design as in cated in the sketches of fig. 3 it is possible, while maintaining h efficiencies at full load, to increase the specific speed from ab 15, its minimum value with the type shown in fig. 3A, to ab 125 with the type shown in fig. 3D. Specific speeds as high as are possible with some sacrifice in efficiency, and it is probable t further developments will see the value increased still farth These high specific speeds are extremely valuable for low-h installations since they enable the size and cost of the turbine a of the generator to be greatly reduced. In fact, many exist low-head installations would have been commercially impractica but for the development during recent years of the high-sp turbine.

High specific speeds are, however, attended by some disadv tages. The part-gate efficiency in general falls off as the spec speed increases. Also if the speed is unduly high it becomes v difficult to avoid very high local velocities and centres of l pressure in the runner, which invariably give rise to severe cor sion. At the present stage of design, the maximum specific spe to be used under normal circumstances with various heads are proximately as follows:

Head (feet)	20	40	60	80	100	150	200	300	400	6
Specific speed r. p. m.	125	100	85	75	65	50	43	33	30	2

The reaction turbine may be built either as a horizontal or verti shaft machine. The latter type, having the weight of the rotat parts supported by a thrust bearing of the Michell or Kingsbu type, has been gaining in popularity of recent years.

The Pelton Wheel.—This is usually built as a horizontal sh machine and consists of a runner carrying a series of buck around its periphery on which impinge one—or in exceptio cases two—high velocity jets from a nozzle or nozzles at the e of the supply pipe line (fig. 5). The buckets are spoon shaped a have a central sharp ridge which divides the impinging jet i

halves which are deflected backwards by the buckets through nt 165°. The modern Pelton wheel is always fitted with a ular nozzle, with an axial needle or spear for regulating the of the jet. The maximum diameter of jet as yet adopted is nt 12 inches. The axial position of the needle in the nozzle is lated by the governing mechanism in all important installa- s.

he Pelton wheel, being essentially a high head turbine, is lly supplied through a comparatively long pipe line, and any

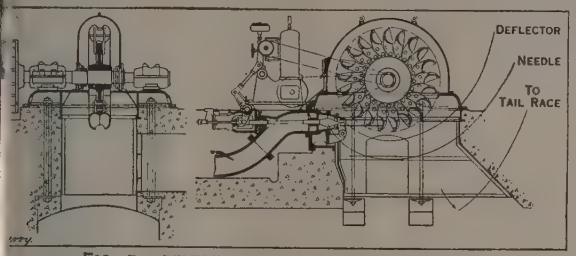


FIG. 5.—PELTON WHEEL WITH SINGLE NOZZLE

d closing of the nozzle such as might occur if the load were denly thrown off, would set up severe surges of pressure in the line which would not only prevent close speed regulation but nt be dangerous. To prevent this, modern Pelton wheels are fitted with a jet deflector, consisting of a curved plate pivoted ween the nozzle and the buckets, which is operated by the gov- or and which when in action cuts into the jet and deflects it er wholly or partially into the tail race. The governing mech- m is so arranged that when load is thrown off the wheel, the ector at once comes into play, deflecting the jet from the kets. The needle then begins to move slowly towards the closed tion, and at the same time the deflector moves slowly back ards its idle position. Ultimately both come to rest with the ector just clear of the jet, and with the diameter of the latter djusted as to give the required supply of water to the wheel.

ydraulics of the Pelton Wheel.—If H be the pressure l behind the nozzle, in feet, the velocity of efflux is $C_v\sqrt{2gH}$ per second, where C_v, the coefficient of velocity, in a well- ned needle nozzle is approximately ·99. Calling this velocity V_1, horsepower of the jet is equal to

$$\frac{62{\cdot}4aV_1^3}{550\times 2g}$$

re a is the area of the jet in square feet.

u = peripheral speed of buckets at pitch circle, in ft. per second.
V_2 = final absolute velocity of water leaving the buckets.
$_1v_r$ = relative velocity of jet and bucket at entrance.
$_2v_r$ = relative velocity of jet and bucket at discharge.
α = mean angle between jet and tangent at point of contact.
γ = total angle of deflection of buckets (fig. 6).

n the initial velocity of jet in direction of angent at point of impact $= V_1\cos\alpha$.

component, parallel to the tangent at discharge, of final velocity relative to bucket $= {}_2v_r\cos\gamma$.

Absolute velocity in this direction at discharge $= u + {}_2v_r\cos\gamma$.

Change of tangential momentum per second per pound

$$= \frac{1}{g}(V_1\cos\alpha - u - {}_2v_r\cos\gamma).$$

Work done per pound of water per second

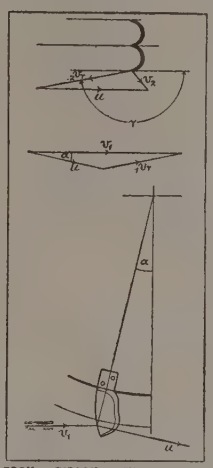
$$= \frac{u}{g}(V_1\cos\alpha - u - {}_2v_r\cos\gamma) \text{ ft. lb.}$$

Efficiency $$= \frac{u}{gH}(V_1\cos\alpha - u - {}_2v_r\cos\gamma).$$

The loss due to friction and eddies in the buckets $= \frac{{}_1v_r^2 - {}_2v_r^2}{2g}$ b. per pound, where $ {}_1v_r^2 = V_1^2 + u^2 - 2V_1u\cos\alpha$.

The loss due to rejection of kinetic energy in the discharge $= \frac{V_2^2}{2g}$ ft. lb. per pound, where $V_2^2 = u^2 + {}_2v_r^2 + 2u_2v_r\cos\gamma$.

Tests show that in an average wheel $_2v_r$ may be as low as from ·5 to ·6 $_1v_r$. In a well-designed bucket, however, having a ratio of bucket width to jet diameter not less than about 3·3, this ratio approximates to ·75 or even ·8. If the angle of deflection were 180°, and if the buckets were frictionless, the value of the peripheral speed of the wheel for maximum efficiency would be $V_1\cos\alpha \div 2$, or approximately $V_1 \div 2$, since α is small. When account is taken of the various losses and of the fact that γ is less than 180°, the best peripheral speed lies between ·44 and ·48V_1.



FROM GIBSON, "HYDRAULICS" (CONSTABLE & CO.)

FIG. 6.—VELOCITY DIAGRAMS FOR PELTON WHEEL BUCKETS

Comparison of Impulse and Reaction Turbines.—The peripheral velocity of a Pelton wheel for maximum efficiency is slightly less than one-half the velocity of the jet (usually approximately $\cdot 46\sqrt{2gH}$, where H is the head), while that of the reaction turbine varies from about $\cdot 65\sqrt{2gH}$ to $1{\cdot}05\sqrt{2gH}$, depending on the design. Because of this, the Pelton wheel is well adapted for very high heads, which may then be utilized with moderate speeds of rotation. On the other hand the relatively high speed of the reaction turbine enables reasonably high rotative speeds to be obtained with low heads.

The Pelton wheel cannot well be designed to utilize efficiently more than two jets on a single wheel, and as the maximum practicable jet diameter is not large, the volume of water which can be handled and the output of the turbine become small under low heads. The reaction turbine with its full peripheral admission on the other hand is well adapted for large volumes. It is not suited for small powers under high heads, since the volume of water is then small, the waterways are of very small sectional area and easily become choked by floating debris, and the fluid friction losses become relatively high.

The Pelton wheel cannot easily be adapted to the use of a suction or draft tube, and, where the tail-race level may vary appreciably, must be installed above the highest probable tail-water level with some sacrifice of head. The efficiency of the reaction turbine is not so sensitive to changes of head as that of the Pelton wheel, but if operated under constant head and at constant speed, the efficiency of the Pelton wheel does not fall off so rapidly at part loads as that of the reaction turbine. On the other hand, the modern reaction turbine has a slightly higher full-load efficiency, so that the average efficiency from half to full load is sensibly the same in a well-designed machine of either type. The following table shows typical values of the part-load efficiencies of modern turbines of both types of large size, installed under equally favourable conditions.

Proportion of maximum discharge	·2	·3	·4	·5	·6	·7	·8	·9	1·0
Efficiency of reaction turbine	·60	·70	·75	·79	·82	·87	·90	·91	·89
Efficiency of Pelton wheel	·70	·78	·82	·83	·84	·85	·86	·85	·83

The possibilities of accurate speed regulation are about equal in the two types.

For large units the reaction turbine is generally preferable for heads up to 400 feet. For heads above 750 ft. the Pelton wheel is more suitable, while between these limits the choice depends largely upon local circumstances and on the power required. The greater simplicity and accessibility of the parts requiring replacement due to natural wear and tear renders the Pelton wheel more

suitable when the supply is taken from a stream carrying an appreciable amount of grit.

The reaction turbine has been built in units capable of developing 65,000 H.P. The most powerful Pelton wheel yet constructed develops about 30,000 H.P., but these outputs could be largely extended if necessary.

TURBOT (*Prelta maxima*), a flat fish of the Mediterranean and the Atlantic coast of Europe, is distinguished by a large terminal mouth, eyes on the left side, a very deep body and a naked skin, with conical bony tubercles scattered on the eyed side. The brill, a related species, is not so deep, and is scaly. The turbot is a valued food-fish; it feeds mainly on other fishes; it attains a weight of 30 lb. It has a longer larval life than most flat fishes, and specimens nearly an inch in length, with an eye on each side, may be found swimming at the surface.

TURDIDAE: *see* THRUSHES.

TURENNE, HENRI DE LA TOUR D'AUVERGNE, VICOMTE DE (1611–1675), marshal of France, second son of Henri, duke of Bouillon and sovereign prince of Sedan, by his second wife Elizabeth, daughter of William the Silent, prince of Orange, was born at Sedan on Sept. 11, 1611. At the age of fourteen he went to learn war in the camp of his uncle, Maurice of Nassau, and began his military career (as a private soldier in that prince's bodyguard) in the Dutch War of Independence. Frederick Henry of Nassau, who succeeded his brother Maurice in 1625, gave Turenne a captaincy in 1626. In 1630 Turenne left Holland and entered the service of France. Cardinal Richelieu at once made him colonel of an infantry regiment. He still continued to serve at frequent intervals with the prince of Orange, who was the ally of France. In 1635 Turenne served under Cardinal de la Valette in Lorraine and on the Rhine. The siege of Mainz was raised but the French army had to fall back on Metz from want of provisions. In the retreat Turenne measured swords with the famous imperialist General Gallas, and distinguished himself greatly by his courage and skill. The reorganized army took the field again in 1636 and captured Saverne (Zabern), at the storming of which place Turenne was seriously wounded. In 1637 he took part in the campaign of Flanders and was present at the capture of Landrecies (July 26) and in the latter part of 1638, under Duke Bernhard of Saxe-Weimar (1608–1639), he directed the assault of Breisach (reputed the strongest fortress on the upper Rhine), which surrendered on Dec. 17. He had now gained a reputation as one of the foremost of the younger generals of France, and Richelieu next employed him in the Italian campaign of 1639–40 under "Cadet la Perle," Henri de Lorraine, count of Harcourt (1601–1666). The favourable result of the complicated operations of this campaign was largely due to Turenne, who had by now become a lieutenant-general. He himself commanded during the campaign of 1641 and took Coni (Cuneo), Ceva and Mondovi. In 1642 he was second in command of the French troops which conquered Roussillon. At this time the conspiracy of Cinq Mars (*see* FRANCE: *History*) in which Turenne's elder brother, the duke of Bouillon, was implicated, was discovered.

The earlier career of Turenne was influenced by the relations of the principality of Sedan to the French crown; moreover his steady adherence to the Protestant religion was an element of difficulty in Turenne's relations with the ministers. Cardinal Richelieu nevertheless entrusted him with the command in Italy in 1643 under Prince Thomas (who had changed sides in the quarrel). Turenne took Trino in a few weeks, but was recalled to France towards the end of the year. He was made a marshal of France (Dec. 19) and was soon sent to Alsace to reorganize the "Army of Weimar"—the remnant of Duke Bernhard of Saxe-Weimar's troops—which had just been severely defeated at Tüttlingen (Nov. 24–25, 1643). He was thirty-two years old.

The work of reorganization over, Marshal Turenne began the campaign in June by crossing the Rhine at Breisach, but was almost instantly joined by an army under the duc d'Engh (afterwards the great Condé), who, as a prince of the ro house, took the chief command of the united armies of "Fran and "Weimar." The four famous campaigns which follo brought to an end the Thirty Years' War (*q.v.*). The ch event of the first of these was the desperately-fought battle Freiburg against Count Mercy's Bavarians (Aug. 3, 5 and 1644), after which Philipsburg was successfully besieged. Bef the capitulation Enghien withdrew and left Turenne in comma The marshal opened the campaign of 1645 with a strong forw movement, but was surprised and defeated by Mercy at Merg theim (Marienthal) on May 2. Enghien was again sent to front with the army of France and Turenne's army was grea increased by the arrival of a Swedish force and a contingent fr Hesse-Cassel. The Swedes soon departed, but Enghien was at head of 20,000 men when he met the Bavarians in a battle ev more stubbornly contested than Freiburg. Mercy was killed a his army beaten at Allerheim near Nördlingen (Aug. 3, 164

Ill-health forced Enghien to retire soon afterwards, a Turenne was for the third time left in command of the Fre army. He was again unfortunate against the larger forces the imperialists, but the campaign ended with a gleam of succ in his capture of Trier (Trèves). In the following year (164 he obtained more decided successes, and, by separating the Aust ans from the Bavarians, compelled the elector of Bavaria to ma peace (signed March 14, 1647). In 1647 he proposed to atta the thus weakened army of the emperor, but was ordered i Flanders instead. Not only was the opportunity thus lost t a serious mutiny broke out amongst the Weimar troops, wh pay was many months in arrear. The marshal's tact and firmn were never more severely tried nor more conspicuously displa than in his treatment of the disaffected regiments, among wh in the end he succeeded in restoring order with little bloodsh He then marched into Luxembourg, but was soon recalled to t Rhine, for in 1648 Bavaria had returned to her Austrian allian and was again in arms. Turenne and his Swedish allies made brilliant campaign, which was decided by the action of Zusma hausen (May 17), Bavaria being subsequently wasted with f and sword until a more secure pacification was obtained.

The peace of Westphalia (1648) was no peace for Fran which was soon involved in the civil war of the Fronde. (S FRANCE: *History*.) Few of Turenne's actions have been m sharply criticized than his adhesion to the party of revolt. T army of Weimar refused to follow its leader and he had to f into the Spanish Netherlands, where he remained until the trea of Rueil put an end to the first war of the Fronde. The seco war began with the arrest of Condé and others (Jan. 165 amongst whom Turenne was to have been included; but escaped in time and with the duchesse de Longueville held Sten for the cause of the "Princes"—Condé, his brother Conti, a his brother-in-law the duc de Longueville. Love for the duche seems to have ruled Turenne's action, both in the first war, ar now, in seeking Spanish aid for the princes. In this war Turen sustained one of his few reverses at Rethel (Dec. 15, 1650); b the second conflict ended in the early months of 1651 with t collapse of the court party and the release of the princes.

Turenne became reconciled and returned to Paris in Ma but the trouble soon revived and before long Condé again rais the standard of revolt in the south of France. In this, the thi war of the Fronde, Turenne and Condé were opposed to ea other, the marshal commanding the royal armies, the prince th of the Frondeurs and their Spanish allies. Turenne displayed t personal bravery of a young soldier at Jargeau (March 28, 165 the skill and wariness of a veteran general at Gien (April 7 and he practically crushed the civil war in the battle of t Faubourg St. Denis (July 2) and the reoccupation of Paris (O 21). Condé and the Spaniards, however, still remained to b dealt with, and the long drawn out campaigns of the "Spani Fronde" gave ample scope for the display of scientific genera ship on the part of both the famous captains. In 1653 the a vantage was with Turenne, who captured Rethel, St. Menehou and Muzon, while Condé's sole prize was Rocroy. The sho

paign of 1654 was again to the advantage of the French; on 25, the Spanish were defeated at Arras. In 1655 more nd was gained, but in 1656 Turenne was defeated at nciennes in the same way as he had beaten Condé at Arras. war was eventually concluded in 1657 by Turenne's victory e Dunes near Dunkirk, in which a corps of English veterans by Cromwell played a notable part (June 3–14); a victory n, followed by another successful campaign in 1658, led to eace of the Pyrenees in 1659.

h the death of Cardinal Mazarin in 1661 Louis XIV. took eins of government into his own hands and one of his first was to appoint Turenne "marshal-general of the camps and es of the king." He had offered to revive the office of able of France (suppressed in 1627) in Turenne's favour if narshal would become a Roman Catholic. Turenne declined. of Calvinist parents and educated a Protestant, he had ed to marry one of Richelieu's nieces in 1639 and subsetly rejected a similar proposal of Mazarin. He had later ied a daughter of the Protestant Marshal de la Force, to n he was deeply attached. But he sincerely deplored the ion of the Christian church into two hostile camps. How ly both he and his wife studied such evidence as was availis shown by their correspondence, and, in the end, two years her death, he was prevailed upon by the eloquence of uet and the persuasions of his nephew, the abbé de Bouillon, ive in his adhesion to the Orthodox faith (Oct. 1668). In he had returned to the more congenial air of the "Camps Armies of the King," directing, nominally under Louis XIV., famous "Promenade militaire" in which the French overran Spanish Netherlands. Soon afterwards Condé, now recon- with the king, rivalled Turenne's success by the rapid con- t of Franche Comté, which brought to an end the War of olution in February 1668.

Louis XIV.'s Dutch War of 1672 (*see* DUTCH WARS) nne was with the army commanded by the king which ran Holland up to the gates of Amsterdam. The dikes were ed and the country round Amsterdam flooded. This heroic sure completely checked Turenne, whom the king had left in mand. Turenne now fought a successful war of manoeuvre he middle Rhine while Condé covered Alsace. In January Turenne assumed the offensive, penetrated far into Ger- y, and forced the Great Elector of Brandenburg to make e; later in the year, however, he was completely outoeuvred by the famous imperial general Montecucculi, who ed his opponent, joined the Dutch and took the important e of Bonn. In June 1674, however, Turenne won the battle inzheim, which made him master of the Palatinate. Under rs from Paris the French wasted the country far and wide. he autumn the allies again advanced, and though Turenne again outmanoeuvred, his failure on this occasion was due he action of the neutral city of Strasbourg in permitting enemy to cross the Rhine by the bridge at that place. The le of Enzheim followed; this was a tactical victory, but ly affected the situation, and, at the beginning of December, allies were still in Alsace. The old marshal now made the t daring campaign of his career. A swift and secret march id-winter from one end of the Vosges to the other took the s by surprise. Sharply following up his first successes, nne drove the enemy to Turkheim, and there inflicted upon a heavy defeat (Jan. 5, 1675). In a few weeks he had pletely recovered Alsace. In the summer campaign he was more opposed to Montecucculi, and after the highest display strategic chess-moves" by both commanders, Turenne finally pelled his opponent to offer battle at a disadvantage at Sassn. Here, on July 27, 1675, he was killed by almost the first fired. The news of his death was received with universal ow. Turenne's most eloquent countrymen wrote his *éloges*, Montecucculi himself exclaimed: "Il est mort aujourd'hui un me qui faisait honneur à l'homme." His body was taken to Denis and buried with the kings of France. Even the extreme lutionists of 1793 respected it, and, when the bones of the reigns were thrown to the winds, the remains of Turenne were preserved at the Jardin des Plantes until Sept. 22, 1800, when they were removed by order of Napoleon to the church of the Invalides at Paris, where they still rest.

Turenne was one of the great captains whose campaigns Napoleon recommended all soldiers to "read and re-read." His fame as a general was the highest in Europe at a period when war was studied more critically than ever before, for his military character epitomized the art of war of his time (Prince de Ligne). Strategic caution and logistic accuracy, combined with brilliant dash in small combats and constancy under all circumstances of success or failure may perhaps be considered the salient points of Turenne's genius for war. Great battles he avoided. "Few sieges and many combats" was his own maxim. And, unlike his great rival Condé, who was as brilliant in his first battle as in his last, Turenne improved day by day. Napoleon said of him that his genius grew bolder as it grew older, and a modern author, the duc d'Aumâle (*Histoire des princes de la maison de Condé*), takes the same view when he says: "Pour le connaître il faut le suivre jusqua'à Sulzbach. Chez lui chaque jour marque un progrès." In his personal character Turenne was little more than a simple and honourable soldier, endowed with much tact, but in the world of politics and intellect almost helpless in the hands of a skilful intriguer or casuist. His morals, if not beyond reproach, were at least more austere than those prevalent in the age in which he lived. He was essentially a commander of regular armies. His life was spent with the troops; he knew how to win their affection; he tempered a severe discipline with rare generosity, and his men loved him as a comrade no less than they admired him as a commander. Thus, though Condé's genius was far more versatile, it is Turenne whose career best represents the art of war in the 17th century. For the small, costly, and highly trained regular armies, and the dynastic warfare of the age of Louis XIV., Turenne was the ideal army leader.

The most notable of the numerous portraits of Turenne are those of P. de Champagne at Versailles, and of Senin (dated 1670) in the Jones collection at South Kensington, London. Of the older memoirs of Turenne the most important are those of "Du Buisson," *La Vie du vicomte de Turenne*—the author is apparently Gatien de Sandraz de Courtilz (Paris, the Hague, and Cologne, 1688–95); Abbé Raguenet, *Histoire du vicomte de Turenne* (Paris 1741) and especially Ramsay, *Histoire d'Henri de la Tour d'Auvergne, vicomte de Turenne* (Paris 1735), the second volume of which contains the marshal's memoirs of 1643–58. These memoirs, of which the Prince de Ligne wrote that "ce ne sont pas de conseils, ce sont des ordres . . . 'faites' . . . 'allez,' etc."—were written in 1665, but were first published (*Mémoires sur la guerre, tirés des originaux*, etc.) in 1738, reprinted in Michaud, *Mémoires sur l'histoire de France*, 3rd series, vol. iii., and Liskenne and Sauvan's *Bibliothèque historique et militaire*, vol. iv. (Paris 1846). A manuscript *Maximes de M. de Turenne* (1644) exists in the Staff Archives at Vienna, and of other documentary collections may be mentioned Grimoard, *Collections de lettres et mémoires trouvés dans le portefeuille de M. de Turenne* (Paris, 1782); *Recueil de lettres écrites au vicomte de Turenne par Louis XIV. et ses ministres*, etc. (Paris 1779); *Correspondance inédite de Turenne avec Le Tellier et Louvois*, ed. Barthélemy (Paris 1874). *See* also the *Observations on the Wars of Marshal Turenne*, dictated by Napoleon at St. Helena (1823); Puységur, *La Guerre par principes et règles* (Paris 1748); Précis in *Bibliothèque internationale d'hist. milit.* (Brussels 1883); Duruy, *Histoire de Turenne* (Paris 1880); Roy, *Turenne, sa vie et les institutions militaires de son temps* (Paris 1884); Hardÿ de Périni, *Turenne et Condé* (Paris 1907); Neuber, *Turenne als Kriegstheoretiker und Feldherr* (Vienna 1869); Sir E. Cust, *Lives of the Warriors of the 17th Century* (London 1867); T. O. Cockayne, *Life of M. de Turenne* (founded on Ramsay's work; London 1853); G. B. Malleson, *Turenne. Marshal Turenne*, by "the author of the Life of Sir Kenelm Digby" (London 1907), is a valuable work by a civilian, and is based in the main on Ramsay's work, the memoirs of Cardinal de Retz, James, duke of York, etc., and on Napoleon's commentaries. A remarkable parallel between Turenne and Condé, in Saint-Evremont's *éloge* of the latter, will be found in Carrion-Nisas, *Essai sur l'histoire général de l'art militaire*, ii. 83 (Paris 1824); C. G. Picavet, *Les dernières années de Turenne 1660–1675* (1919), p. 513; General Weygand, *Turenne* (1929). (C. F. A.)

TURFAN, the name of a remarkable depression in the Tarim region south of the Tienshan, here over 10,000 ft. in height. This is said to be 426 ft. below sea-level at the lowest point. The town of Turfan, just 30 m. to the north, stands some 250 ft. above sea-level, and the general level around the depression rapidly reaches over 2,500 feet. The depression is loess covered and would be fertile if it could be irrigated. The town of Turfan is a double

settlement, part Chinese and part Turki, with a population of 15–20 thousand. In the depression, the temperature varies from 90° for July, calculated at Lukchun, to 13° in January and the daily fluctuations are very great.

TURGAI, a former province of Russian central Asia, now included in the Kazakstan A.S.S.R. (*q.v.*); *see* also AKTUBINSK.

The Turgai strait, a narrow passage over the watershed separating the Tobol and the Irgiz, between the east of the southern Urals and the west of the plateau region of the Kirghiz steppe, is of great structural importance. Through it came the marine transgressions of previous geological epochs; the upper Cretaceous advanced into the south-west only, but those of the upper Eocene and Oligocene extended along the east of the Urals and the Lower Oligocene sea of Germany reached the Arctic Ocean. During the age of the amber forests the Strait of Turgai was closed and no sea again entered Siberia by that route. The course of the Tobol river marks the direction of the ancient marine connection. At a recent epoch the present Turgai river, which enters Lake Chalkarteniz and which receives the Irgiz as a tributary, flowed into the Sea of Aral, its volume being then much increased by tributaries which now lose themselves in the sand before reaching it.

See Suess *The Face of the Earth,* Vol. III. (1908).

TURGENEV, IVAN SERGEYEVICH (tōōr-gān'yĕv) (1818–1883), Russian novelist, was born at Orel, of a family of provincial gentry. His father had married for money a woman older than himself, who made up for her thwarted affections by making herself a domestic tyrant to her children, as well as to her serfs. Turgenev was educated at home, at the Universities of Moscŏw and St. Petersburg, and finally (1839–40) at Berlin, where, in contact with young Russian intellectuals, he became a Westernizer. In 1843 he published *Parasha,* a tale in verse, which was favourably reviewed by Belinsky. Turgenev deserted the civil service for letters and was infatuated with the famous singer, Pauline Garcia (Mme. Viardot); this caused a breach with his mother, who cut off his allowance. He lived as a Bohemian until her death (1850) made him a rich man. His lifelong affection for Mme. Viardot, who merely tolerated his presence, met with no response, but left a deep impress on his work. Turgenev abandoned poetry for the drama (which he also abandoned after 1852) and for prose fiction. His first great success was *A Sportsman's Sketches* (started 1847, in book form 1852), in which the peasants appeared more attractive than their masters. It was received as a protest against serfdom. In 1852 Turgenev was exiled to his estate for a while because of his laudatory obituary on Gogol.

His masterpieces included short stories like *The Backwater, Asya, First Love,* and the more ambitious novels *Rudin* (1856), *A Nest of Gentlefolk* (1858), *On the Eve* (1860) and *Fathers and Sons* (1862), in which the love plot was interwoven with current social issues. All were commented on at great length by the leading critics. His attempt, however, to draw a strong man in the person of the agnostic and materialist—"nihilist"—Bazarov was resented by the Radical press as a caricature. Turgenev, being sensitive to criticism, was embittered against his countrymen and settled abroad, and his later works are mainly retrospective. The two novels in which he tried to deal with actuality, *Smoke* (1867) and *Virgin Soil* (1877), only show the depth of his bitterness and his complete loss of touch with contemporary Russia. However, his last visit to Russia (1880) was a triumphant progress. He died in 1883, at Bougival, near Paris.

Turgenev was the first Russian author to be read and admired by Europe. During his last years he lived in close touch with the French literary world, contracted intimate friendships (especially with Flaubert) and was regarded as a master by younger men like Maupassant. He was very popular in this French circle, but much less so among his Russian compeers: Tolstoy, Dostoyevsky and Nekrasov all sooner or later came to detest him.

Turgenev is the most poetical (in the 19th century acceptance of the word) of the Russian realists. He had undergone the profound influence of Pushkin (as well as of Lermontov and George Sand). His novels are largely variations on the theme of *Eugene Onegin.* His character drawing does not depend on analysis and psychology, but on a subtly-woven poetic atmosphere that accompanies the characters like an aura. This applies mainly to women; they are invariably stronger and more attractive t his men, who (with the single exception of Bazarov) are neu thenic weaklings. His style is marked by a careful simplicity elaborate naturalness that answered to the highest ideals of century taste. Delicately-drawn landscape passages are am its most outstanding features.

TURGOT, ANNE ROBERT JACQUES, BARON DE LAUNE (1727–1781), French statesman and economist, was b in Paris on May 10, 1727, the youngest son of Michel Étie Turgot "provost of the merchants" of Paris. He was educated the Church, and at the Sorbonne, to which he was admitte 1749 (being then styled abbé de Brucourt), he delivered two markable Latin dissertations, *On the Benefits which the Chris Religion has conferred on Mankind,* and *On the Historical P ress of the Human Mind.* In 1750 he decided not to take h orders, giving as his reason, according to Dupont de Nemo "that he could not bear to wear a mask all his life." In 175 became *substitut,* and later *conseiller* in the parlement of Pa and in 1753 *maître des requêtes.* In 1754 he was a membe the *chambre royale* which sat during an exile of the parleme in 1755 and 1756 he accompanied Gournay, then intendant commerce, in his tours of inspection in the provinces, in 1760, while traveling in the east of France and Switzerla visited Voltaire, who became one of his chief supporters.

In August 1761 Turgot was appointed intendant of *généralité* of Limoges, which included some of the poorest most over-taxed parts of France; here he remained for 13 ye He was already deeply imbued with the theories of Quesnay Gournay (*see* PHYSIOCRATIC SCHOOL), and set to work to ap them as far as possible in his province. He continued the w on the *cadastre,* or new official survey, begun by his predece Tourny, in order to arrive at a juster assessment of the *tai* he also obtained a large reduction in the contribution of province. He published his *Avis sur l'assiette et la répartition la taille* (1762–1770), and as president of the *Société d'agricul de Limoges* offered prizes for essays on the principles of taxati Quesnay and Mirabeau had advocated a proportional tax (*im de quotité*), but Turgot a distributive tax (*impôt de répartitio* Another reform was the substitution for the *corvée* of a tax money levied on the whole province, the construction of ro being handed over to contractors. In 1769 he wrote his *Mém sur les prêts à intérêt,* in which the question of lending money interest was for the first time treated from a scientific, not fr a moral standpoint. Among other works written during Turg intendancy were the *Mémoire sur les mines et carrières,* and *Mémoire sur la marque des fers,* in which he protested agai state interference and advocated free competition.

During the famine of 1770–1771 he enforced on landown "the obligation of relieving the poor" and especially the *métay* dependent upon them, and organized in every province *ateli* and *bureaux de charité* for providing work for the able-bod and relief for the infirm. Turgot made the *curés* the agents his charities and reforms when possible. In 1770 he wrote famous *Lettres sur la liberté du commerce des grains,* addres to the comptroller-general, the abbé Terray. Three of th letters have disappeared, having been sent to Louis XVI. Turgot at a later date and never recovered.

Turgot's best known work, *Réflexions sur la formation et distribution des richesses,* written in 1766 for the benefit of t young Chinese students, appeared in 1769–1770 in Dupon journal, the *Éphémérides du citoyen,* and was published separat in 1776. After tracing the origin of commerce, Turgot develo Quesnay's theory that the land is the only source of wealth, a divides society into three classes, the productive or agricultur

alaried (*stipendiée*) or artisan class, and the land-owning (*classe disponible*). He advocates the *impôt unique, i.e.,* only the *produit net* of the land should be taxed, and the plete freedom of commerce and industry.

July 20, 1774 Turgot was appointed minister of marine gh the influence of Maurepas, and on Aug. 24 he became troller-general. His first act was to submit to Louis XVI. his ng principles: "No bankruptcy, no increase of taxation, no wing." Turgot's policy, in face of the desperate financial on, was one of rigid economy in all departments. He con- ated a thorough-going reform of the *ferme générale*, and, while, imposed certain conditions on the leases as they were red—such as a more efficient personnel, and the abolition ne future of the abuse of the *croupes* (the name given to a of pensions), and annulling certain leases, such as those e manufacture of gunpowder and the administration of the *ageries*, the former of which was handed over to a company Lavoisier as one of its advisers, and the latter superseded better service of diligences which were nicknamed "turgo- " He also prepared a regular budget. Turgot's measures ed the deficit, and raised the national credit to such an extent in 1776, just before his fall, he was able to negotiate a loan some Dutch bankers at 4%; but the deficit was still so as to prevent him from attempting to realize his scheme of ituting for indirect taxation a single tax on land. He sup- ed, however, a number of *octrois* and minor duties.

rgot's edict for free trade in corn signed on Sept. 13, 1774, strongly opposed in the *conseil du roi.* Turgot was hated by in high places who had been interested in the speculations rn, and was opposed by Linguet and by Necker, who in published his treatise *Sur la législation et le commerce des s.* But Turgot's worst enemy was the poor harvest of 1774, h led to a slight rise in the price of bread in the winter and spring of 1774–1775 and to those extraordinary bread-riots n as the "guerre des farines." Turgot showed great firmness decision in repressing the riots, and was loyally supported by ing throughout.

rgot's famous "Six Edicts," were finally presented to the *eil du roi* (Jan. 1776). The two which met with violent sition were, firstly, the edict suppressing the *corvées,* and ndly, that suppressing the *jurandes* and *maîtrises,* the privi- l trade corporations. Turgot announced in the preambles to his intention to subject the noblesse to taxation and to estab- as a principle the right of every man to work without re- tion. He obtained the registration of the edicts by the *e justice* of March 12, but by that time he had won the ed of the nobles and the parlements, the court, the "fi- iers," the clergy, the rich bourgeoisie of Paris and others. queen disliked him for opposing the grant of favours to her égés, and he had offended Mme. de Polignac in a similar ner. Malesherbes and Maurepas ceased to support him, and urepas became reconciled with the queen and her party. His reforms amounted to a complete revolution and Louis XVI. iled at the prospect. On May 12, 1776, Turgot was asked to n. He retired to la Roche-Guyon, château of the duchesse nville, returning shortly to Paris, where he spent the rest of ife in scientific and literary studies, being made vice-president he Académie des Inscriptions et Belles Lettres in 1777. He on March 18, 1781.

n character Turgot was simple, honourable and upright, with ssion for justice and truth. He was an idealist, his enemies ld say a doctrinaire, and certainly the terms "natural rights," tural law," etc., frequently occur in his writings. His friends k of his charm and gaiety in intimate intercourse, but among ngers he was silent and awkward, and produced the im- ssion of being reserved and harsh. Many of the reforms ideas of the Revolution were due to him; the ideas did not rule originate with him, but it was he who first gave them minence. Oncken looks upon him as a bad physiocrat and a fused thinker, while Léon Say considers that "though he failed he 18th century he triumphed in the 19th."

BIBLIOGRAPHY.—G. Schelle, *Turgot* (Paris, 1909); and Marquis de Ségur, *Au Couchant de la monarchie* (Paris, 1910), contain much that is based on recent research. The principal older biographies are those of Dupont de Nemours (1782, enlarged in his edition of Turgot's *Works,* 1807–1811), and Condorcet (1786); the best modern ones are those of A. Neymarck (Paris, 1885), Léon Say (Paris, 1887); and W. W. Stephens (London, 1895). See generally, Oncken, *Geschichte der Nationalökonomie,* vol. ii. ch. 1; Schelle, *Dupont de Nemours et l'école physiocratique* (1888); Henry Higgs, *The Physiocrats* (1897); R. P. Shepherd, *Turgot and the Six Edicts* (1903), in Columbia Univ. Studies, vol. xviii. No. 2; *Oeuvres de Turgot et documents le concernant, avec biographie et notes par G. Schelle* (5 vols., 1913–23).

TURI, a Shī'a Mohammedan tribe which holds the Kurram Valley in the North-West Frontier province, India, and enjoys increasing prosperity. Divided into five clans, all apparently of Hindki (*q.v.*) origin, the Turis wrested the valley from the Bangash Pathāns after 1700, distributing its lands as conquered so that every original settler's family now holds fields all over it. A sturdy race, whose "fathom" is reputed to be 6½ft., they are distraught by faction, but hospitable, and a Turi escort (*badragga*) is famed for its fidelity. They threw in their lot with the Sunnite Pathāns (1851–56), but in the second Afghan War furnished Roberts with supplies, and in 1892 accepted British protection.

TURIN, a city of Piedmont, Italy, capital of the province of Turin, formerly of the kingdom of Sardinia (until 1860), and of Italy till the removal of the seat of government to Florence in 1865. Pop. (1921) 493,289 (town), 502,274 (commune), thus showing rapid growth at the expense of the Alpine valleys (*see* ITALY) with a garrison of 8,500. The area of the city is 4,155 acres, and its octroi circle measures nearly 9 m. Built upon alluvial soil 784 ft. above sea-level, it stands upon the river Po. The streets and avenues, almost all of which are straight, intersect at right angles. In general it has a modern aspect, but its regularity of form is in reality derived from the ancient Roman town of Augusta Taurinorum, which formed its nucleus. The mean temperature at Turin (1871–1900) is 53° F (winter 35°, summer 71°), with an average maximum of 90°, and an average minimum of 17°. Snow falls on an average only on seven days per annum. The rainfall averages 34 in.

The cathedral of St. John the Baptist (the see has been archiepiscopal since 1515) is a cruciform Renaissance building dating from 1492–1498, by the Florentine architect Baccio Pontelli, Meo del Caprina being the contractor. Behind the high altar of the cathedral is the chapel of the Sudario or Sindone, built (1657–1694) by Guarini as a royal burial-place. The "sudario" from which it takes its name is asserted to be the shroud in which Joseph of Arimathea wrapped the body of Jesus. La Beata Vergine della Consolata, another of Guarini's works, has a tower which belonged to the church of St. Andrew, founded by the monk Bruning in 1014. Other churches of note are San Filippo (1672–1772), the largest in Turin, the dome of which fell in just as it was approaching completion under the hands of Guarini and was restored by Juvara, and La Gran Madre de Dio, erected to commemorate the return of the court in 1814. The Palazzo Madama was erected by William VII. of Montferrat at the close of the 13th century on the Roman east gate of the town, remains of the towers of which were incorporated in it. It owes its name to the widow of Charles Emmanuel II., who added the west façade and the handsome double flight of steps from Juvara's design (1718). The extensive royal palace was begun in 1646. Many of the baroque palaces have fine pillared courtyards; some of them are the work of Guarini. The tower of the citadel (1565) contains the artillery museum. The Castello del Valentino is partly in the French style of the 16th century. It contains the polytechnic school, and geological, mineralogical and industrial museums, and the university botanical garden. The university, founded about 1400 by Lodovico di Acaja, had 2,049 students in 1925–26. The engineering school had 1,243 students and the institute of commerce and economics 554. The old university buildings erected in 1713 by the Genoese architect Ricca contain the library, some treasures of which were lost by fire in 1906.

The academy of sciences, founded in 1757, is in a building erected in 1678 by Guarini and contains the local antiquities of Piedmont and Egyptian treasures partly collected by Drovetti, partly excavated in the present century at Thebes, Assiout, etc.

The pictures are by Van Dyck and by north Italian masters. There is a museum of zoology and mineralogy in Palazzo Carignano (another of Guarini's buildings), and the royal palace contains the royal armoury (a fine collection begun by Charles Albert in 1833) and the royal library with its rich manuscript collection and its 20,000 drawings.

There are many modern public monuments including those to Emmanuel Philibert (1838), Charles Albert (1861), Victor Emmanuel II. (1899), the Duke of Aosta (1902), Mazzini (1915). The Mole Antonelliana, built by Alessandro Antonelli, is used for the Risorgimento Museum. It is the highest brick edifice in Europe, its summit being 510 ft. above ground, the dome being raised upon a hall with three galleries, one above the other. The newer parts of the city, extending towards the south beyond the stadium (1911) are finely laid out.

Among the hospitals is that called by the name of its founder, Cottolengo, a vast institution providing for more than 7,000 persons.

The industries comprise metallurgy, machine-making, chemicals, silk and cotton weaving, tanning and leather-working, artificial silk and fibres, matches, candles, soap, furniture, perfumes, glass, damasks, velvets, woollens, ready made clothing, etc. The manufacture of motor-cars has become of great importance. Turin is the chief seat of the industry in Italy. Aeroplanes are also manufactured: and chocolate, liqueurs and vermouth are made. The application of electricity is widely developed on account of the proximity of the Alpine valleys, and the hydro-electric plants of the Mont Cenis, the Val d' Aosta, and the Toce valley all concentrate on Turin.

Milan, owing to its nearness both to the St. Gotthard and to the Simplon, is the most important railway centre of Italy. Turin is however nearest to the Mont Cenis, while the completion of the line through Cuneo over the Col di Tenda now affords direct communication with the French Riviera.

On the Hill of Superga (2,300 ft. above the sea) Victor Amadeus II. erected a basilica in memory of the liberation of Turin from the French in 1706. King Charles Albert and other Savoy princes are buried in the crypt. Not far from Turin are also the royal castles of Moncalieri, Stupinigi, Rivoli, Racconigi, Agliè, Venaria Reale.

Turin was made the chief town of Piedmont by Amadeus, first duke of Savoy. (*See* SAVOY, HOUSE OF.) Between 1536 and 1562 Turin was occupied by the French, and in 1630 it lost 8,000 of its citizens by the plague. The French were masters once more from 1640 to 1706, and again from 1798 till 1814, when Piedmont was restored to the house of Savoy.

The ancient *Augusta Taurinorum* was a city of Gallia Cisalpina, the chief town of the Taurini. The natural advantages of its site and its position with relation to the pass over the Alpis Cottia (Mont Genèvre; *see* COTTII REGNUM) made it important, though Hannibal, after crossing the Alps in 218 B.C., was able to take it after a three days' siege. It was partly burned down in A.D. 69, but continued to be prosperous. The Roman town formed a rectangle 2,526 ft. by 2,330 (770 × 710 metres). This measurement is questioned by F. Haverfield, *Ancient Town-Planning* (Oxford, 1913) 87, but is confirmed by an article by U. Savoia in *Town-Planning Review* xii. (1927). The walls, which were 21 ft. high, 7 ft. thick at ground level and 3 ft. at the top, were standing till about 1600; and the north gate, the Porta Palatina, exists. The interior of the town was divided by seven streets from east to west and eight from north to south into 72 blocks (*insulae*), and the ancient pavement and the drains below it are frequently found under the streets of the central portion of the modern town, indicating that they follow the ancient lines. Remains of a theatre have been discovered in the palace garden.

See C. Promis, *Storia dell' antica Torino* (Turin, 1869); A. d'Andrade, *Relazione dell' ufficio regionale per la conservazione dei monumenti del Piemonte e della Liguria, 7 seq.* (Turin, 1899).

(T. A.)

Battle of 1706.—Turin was besieged in 1706 by the French under La Feuillade (*see* SPANISH SUCCESSION, WAR OF THE) who was covered by another army under the duc d'Orleans. Eugene of Savoy (*q.v.*) marching to the relief of Turin with 30,000 A trians and Germans, eluded Orleans and in mid-August appe before the French siege lines. The united armies of Feuillade Orleans numbered over 70,000 men, but on Sept. 7 Eugene bo attacked them in their entrenchments between the rivers Doria Stura. After the usual artillery duel, Eugene gave the orde advance. The Brandenburgers on the left quickly got to with few paces of the entrenchments, but were driven back by French fire. Eugene then led the Germans on his left in a bril attack which stormed the entrenchments. Seeing this, Euge cousin, the duke of Savoy, attacked the French centre and, a three repulses, stormed it, Orleans being wounded, and his tenant, Marshal Marsin, killed. The French tried to rally, the garrison of Turin took part in the discomfiture of the fugit Feuillade raised the siege and joined Orleans in a disorderly treat. Each side had about 3,000 killed and wounded, but 6 prisoners fell into Eugene's hands and French prestige in Nort Italy was destroyed.

TURINA, JOAQUIN (1882–), Spanish composer, born at Seville on Dec. 9, 1882. He studied under D'Indy Paris, from 1905–14. On his return to Spain he brought ou encyclopaedia (*Enciclopedia abreviada de la música*, Ma 1917). His principal works are: *Procesión del Rocio* for or tra; music for the morality play, *La adúltera penitente;* a matic work, *Jardín de oriente* (1923); a pianoforte quint string quartet, *Escena Andaluze*, for viola, pianoforte and s quartet; *Poema de una Santuquena*, and songs.

TURKESTAN: *see* TURKISTAN.

TURKESTAN (Hazret, Yasi), a town in the Kazak A.S.S.R., in 43° 8′ N., 68° 18′ E., on the Orenburg-Tash railway 20 m. E. of the Syr-Daria river, alt. 833 feet. Pop. (1 21,786. Its main industry is cotton, and it acts as a depôt fo collection of hides and wool. It is an ancient town and in a Persian architect was commissioned by Timur (Tamerlane build a mosque in honour of the Kirghiz patron Hazret Ya

TURKEY. The present area of Turkey-in-Europe and key-in-Asia combined, as contained within the frontiers fixe the Treaty of Lausanne, is 1,013,000 sq. kilometres. The pop tion of this republic as estimated by the census of 1927 was 13,600,000 but a careful estimate made by European author in 1926 put it at 13,200,000.

The present frontier of Turkey in Europe runs from Ag Stephanos on the Black Sea (near Cape Iniada) along the lin the small river Resvayiap due west to Kizil-Kilisse and the Tundza. Hence it proceeds south-westwards to the river Ma which it crosses between Mustafa Pasha and Kedikeui. From it turns sharply south and then south-eastwards and reaches left bank of the Maritsa which it follows to the Aegean se the mouth of that river at Enos. This frontier was substitute the Treaty of Lausanne for that fixed by the Treaty of Tri which ran from Ormanli, just south of Midia, to Kallicra opposite Büyük Chesme on the Sea of Marmora. The whol eastern Thrace was thus given back to Turkey and a substa Turkey-in-Europe recreated. The frontier above describe against Bulgaria from Aghios Stephanos to a point south of Maritsa at Hortakeui. From here to the Aegean it is aga Greece. The main railway-line from Europe via Sofia to Cons tinople enters Turkey near Mustafa Pasha but passes over Turkish border again just south of Adrianople into Greek t tory which it traverses for some ten miles along the west ban the Maritsa.

The chief land-frontier of Turkey however is in the east. F a point about 20 miles south-west of Batum it extends south keeping Artvin in Turkish territory and leaving Akhaltsikh Russia. It then passes in front of the Russo-Armenian town Alexandropol and Erivan, and turns due south at Mt. Ara From here it passes the town of Bayezid leaving Urmia and L Urmia to Persia and running along a mountain ridge. Near town of Amadia it turns due west along the Iraq frontie Jezireh where the Arabian and Syrian frontiers begin. F Jezireh it goes north of Urfa and Marash to the Sea just eas Adana.

VIEWS OF CONSTANTINOPLE

1. Inside the outer bridge of the Golden Horn, where native craft dock and the water guilds that handle the business of the harbour are stationed. On the left (background) is the Mosque of Suleiman the Magnificent, built by Sinan

2. Aerial view of Stamboul, the oldest section of Constantinople. In the foreground is the site of the ancient Hippodrome (about A.D. 196), faced (right) by the church of Saint Sophia and (left) by the Mosque of Ahmed

succeed the Hittites as masters of Anatolia. They are also virile enough to have lasted as a separate people into the third century of our era, using their own language down to Christian times.

As the Hittite Empire fell so the southern colonial settlements like Carchemish became isolated city states more or less dependent upon the rising Assyrian power. Hittite cities are few; besides the three already mentioned there is one more, recently identified (in 1927), at Kürigin Kaleh on the Halys near the point where the new Angora-Kaisarieh railway crosses it. It is of great area and evidently a site of considerable importance. Its walls can still be traced. But signs of Hittite domination are found widespread in Asia Minor in the shape of rock-sculptures and fortresses.

From the time of the fall of the Hittite Empire about 1200 B.C. the history of Asia Minor becomes obscure and archaeology has little to give us. By the end of the seventh century the Lydian empire had established itself on the ruins of the western part of the Hittite regions. The Ionian coast, always a self-contained region whose inhabitants lived a life apart from that of the rest of the Asia Minor, contained a heterogeneous body of settlers who had never fallen directly under the Hittite yoke and who were never united into one power until the Persians welded their empire to reach to the Aegean. Lydians, Lycians, Carians and many other semi-barbaric peoples had retained a semblance of independence throughout the Hittite domination largely because of contact with the Achaeans and seafaring peoples of the west.

Lycians and Carians, however remain without archaeological content except for the sixth century tombs of Lycia, based wholly on the Greek styles of architecture and sculpture.

The fall of Troy and of the Hittite empire alike laid the Anatolian coast open to western enterprise and by 700 Greeks were pouring over from the islands and the mainland and founding colonies and settlements along the whole coastline. Ephesus, Priene, Magnesia on the Maeander, Miletus and Sardis have been thoroughly excavated and throw a flood of light upon the Greek period from 650 down to the Hellenistic times. Pergamon has produced the finest discoveries of the Hellenistic period in the shape of the mighty sculptures of the altar of Zeus, now to be seen in Berlin. Tralles has added to our knowledge of Hellenistic art. Sardis illuminates us but little for the earlier Lydian period but fully for the Hellenic. Clazomenae and Cnidus have given us of the treasures of early Greek art.

The Roman period is as fully represented and at Angora survives one of the most important Roman documents extant in the shape of the *Monumentum Ancyranum*, the will of Augustus, inscribed on the walls of a small temple. Roman roads as well as roads built by the Persians, Roman aqueducts and the elements of a prosperous Roman province survive throughout Anatolia.

Byzantine power is represented by many great cities of which Nicaea (Isnik) was the most important, as being the centre of Greek reaction and reorganisation after the Latin conquest of Constantinople in 1204. Unfortunately nothing of Nicaea now remains except the walls, and all the churches, in which were some of the finest mosaics extant, were destroyed during the Turco-Greek war of 1921. Aphrodisias, a Byzantine town of the interior along the Maeander valley inland from Aidin, has produced an astonishing wealth of exceptionally interesting works of early Byzantine art.

Turkey-in-Europe has, for political reasons remained inaccessible to the archaeologist. There is no excavated site there or in the Gallipoli peninsula. Yet the plains of eastern Thrace are studded with the tumuli and settlements of many races and the importance of excavation in those parts is manifest. Ainos (the modern Enos) at the mouth of the Maritsa river is an old Greek colony and there are many others along the shores of Marmora. Cyzicus near Panderma is the largest site in the Marmora region but it has never been excavated. Gallipoli was in antiquity fairly well populated in the Hellenic period, mainly by Athenian colonies.

Population.—All statistics for population in Turkey are suspect. No reliable and absolutely trustworthy census has yet been taken. Even that taken on October 28, 1927 is not to be relied on since the method of counting was not adequately controlled. The total given by that census was 13,647,810.

Constantinople is said to have a total of 1,011,265 inhabit though in the recent census the total was given as some 850 The larger number, however, may be taken as including al suburbs along the Bosporus and the Golden Horn, while smaller number represents only the strictly urban population the total of 1,011,265 a majority is Turkish—682,801 in all. T

A TURK PASSING A LEISURELY HOUR SMOKING THE LONG "HOOKAH"

are 181,188 Greeks, 81,357 menians, 3,782 Bulgarians, Greek Catholics and 61,750 and other nationalities.

In Anatolia and Ea Thrace, on the other hand, distribution of populations changed completely since The Greek population of t two provinces was some million. During the period o Greco-Turkish war of 1921– half of this total emigrated Greece and have under the pices of the League of Na been permanently placed in new provinces of Greece, Thrace, Macedonia, and also to a extent in Attica and Thessaly. The remaining one and a half lion have vanished. Their disappearance can be attribute starvation, massacre (of which that of Smyrna in 1922 was most serious) and gradual extermination.

To counterbalance this serious loss of an industrious popula Turkey can show only some 500,000 Turkish subjects who exchanged for equal numbers of the Greek emigrants. The back to Turkish prosperity by this expulsion and extermina was serious, but there are signs that the country is now begin to recover. The most populous vilayet is that of Smyrna w totals 532,009. Konia comes next with 502,228 while tha Angora has 404,725 and that of Brusa 399,545. Eastern Th is still fairly populous despite the loss of the Greeks who for a high proportion of its inhabitants. The vilayet of Adrian has no less than 150,889 inhabitants while that of Rodosto on Sea of Marmora (originally a Greek town) has 132,120. total population shows an excess of some 500,000 women men, a condition largely caused by the war.

The capital is now Angora which has a population of s 75,000 and is a growing city, but since 1928 the Government shown a tendency to use Constantinople as the capital during summer months.

Statistics are not available to show the total numbers of Ku Circassians, Armenians, Arabs and other nationalities in the rious vilayets.

On the whole Turkey has abandoned the old Ottoman idea Imperial sway over many races and in its place has adopted uncompromising nationalism which seeks to assimilate all s ject races to the Turkihs. This has naturally provoked cert opposition, particularly on the part of the Kurds, who hav very highly developed sense of nationalism. But with most the other races it is certainly succeeding and Turkey to-day p sents a much more homogeneous appearance that she did bef the war. Constantinople has the greatest racial mixture.

The total number of Jews in Turkey is about 150,000. The b of these are the Spanish Jews of the same type as those found Salonika, of the Sephardim group. The rest are Polish Jews the Ashkenazim group or Denumehs (Jewish converts to Isla

Treaties and Constitution.—The present boundaries, tre arrangements and constitution of the country result in the m from the Treaty of Lausanne which was signed on July 24, 19 between Turkey on the one hand and Greece, Great Brita France and Italy on the other. A subsequent treaty was sign between Turkey on the one hand and the governments of I and Great Britain on the other on June 5th, 1926, by which bou daries between Iraq and Turkey and other matters were arrang A treaty was signed at Kars (Oct. 13, 1921) between Turk and the Caucasian republics of Armenia, Azerbaijan and Georg

rming Turkish possession of the three Sanjaks of Kars, han and Batum (excluding the town of Batum).

or the signing of the National Pact and the establishment of Turkish Republic *see* the section HISTORY. The existing d National Assembly has now been put on an electoral and there have been two general elections in Turkey since . Deputies are elected by selected voters. There are what called First Class Electors and Second Class Electors. The er class consist of those citizens who are not foreigners ndischarged bankrupts and who have not, by reason of ce with foreign embassies or consulates acquired special leges or rights. These electors elect voters of the second who proceed to the election of the deputies. There are 400 deputies in all and they are paid LT 3600 per annum.

ne sequel to the abolition of the Caliphate came on April 10th when the Grand National Assembly in session at Angora imously approved of the proposal put forward by General t Pasha, the Prime Minister, that certain articles of the Con- tion should be amended in order to separate religion from State. In detail his proposal was that a new law should be tituted for Articles II, XVI, XXVI and XXXVIII of the Con- tion. These articles dealt with the form of oath taken by uties and the President. The new law makes the oath secular so dissociates religion from State proceedings.

ocal Government in Turkey is highly organised and of an- standing. The country is divided into vilayets or provinces, s or counties, nohiyes or districts which contain smaller s of government in the Kassabas (towns) and villages. A vali e chief administrative officer of a vilayet being appointed by Minister of the Interior and representing directly the Grand onal Assembly. The head of a kaza is a kaimakam, who is appointed by the Minister of the Interior. The head of a ye, however, is a mudir and is appointed by the District mbly. The vali has an administrative council to assist him. ere are both Provincial Assemblies of the vilayets and Dis- Assemblies of the nahiyes. The Provincial Assembly meets a year for a minimum of 15 days and a maximum of 40, the vali as its president. Delegates to this assembly are ed by kazas in the proportion of one delegate to 18,750 male wo for 31,250. Above the latter figure delegates are elected for each 12,500 males.

fter the reorganisation made in 1923 there were 62 vilayets Turkey-in-Europe and Turkey-in-Asia. Of these 62 vilayets ly were in Europe. The ancient system gave only 12 vilayets gether for the whole of the Ottoman Empire. The reorganisa- has therefore further decentralized the government even than before.

ne result of the Treaty of Lausanne was to establish from an national point of view the régime of the Dardanelles and the porus. Article 23 of the Treaty of Lausanne lays down the nciple of freedom of transit and navigation (by sea and by in time of peace as well as in time of war." The fullest ities are to be given to the shipping and the aeroplanes of all ons in time of peace. In time of war, if Turkey is a neutral, rights of international shipping are still considerable and if key is a belligerent the Straits shall still be free for all neutral ping, although the right of search shall be kept by Turkey. fortifications other than those requisite for local protection hipping shall be allowed and all the forts of the Bosporus and Dardanelles are dismantled. A permanent Allied Commission he Straits sits at Constantinople.

ducation.—The bulk of the population of Turkey is still rate. Recent estimates give only 15% as educated and able write. The problems that face the present government are efore pressing. The law of 1929 which introduced Latin racters as compulsory in the place of the old Arabic is not so ntic an educational problem as it would appear in larger and e educated countries. Angora is to control the whole educa- al system and its finance.

nder Article 87 of the new constitution primary education is obligatory on all who are Turkish by birth. Government ols correspond exactly to British elementary schools. In March 1924 a total of 490 medressehs (Church schools) were closed and the primary schools were opened. 19 secondary schools have also been established with 7,400 pupils and co-education is encouraged in both types of school. The number of primary schools is said to be 6,000, with 430,000 pupils. There are also 23 training schools for teachers for commerce and agriculture, with 5,200 students.

Higher education is provided at technical schools, at the Law School of Angora and at the Stamboul University, which now occupies the offices originally built for the Ministry of War—the Seraiskerat. There are technical schools at Stamboul the École des Arts et Métiers for mechanical training and instruction in carpentry; at San Stefano (for Agriculture); for Forestry at Buyukdere and for Viticulture at Erenkeui. At Haidar Pasha there is an excellent Veterinary School. The University of Stamboul has five Faculties—Law, Letters, Science, Medicine and Theology, and a reasonably high standard. There is also an École Normale.

The most important foreign institution is Robert College where pupils are taken irrespective of race or religion. The teaching staff consists of 64 instructors of whom 31 are American. The students number about 500. The College for girls has a teaching staff of 50 with some 350 pupils. These and other foreign schools were, at the Treaty of Lausanne, put upon the same basis as Turkish schools.

The terms of the Treaty of Lausanne allowed for the establishment of schools for Greek and Armenian minorities. But the extermination of these races outside Constantinople has made the clauses applicable only to that city. There are 62 Greek schools with over 14,000 pupils, 53 Orthodox Armenian under the charge of the Armenian Patriarch, and 14 Armenian Catholic.

Justice and Law.—The old system which obtained before the National Assembly revised the constitution was based on the Sunni Moslem law which was religious in origin and sanction and based upon the teaching embodied in the Koran. That it worked well is undisputed and a very high standard of justice was reached even so early as the sixteenth century, when the Sultan Suliman the Magnificent raised the level of administration to a higher level than was then current in western Europe. The tradition of sound popular justice survived and the courts of the Ottoman Empire, despite the capitulations, and despite their notorious slowness were, before the time of Abdul Hamid, mediums of justice not inferior to those of Christendom. In 1869 the religious law was codified into a Civil Code known as the Mejelle and combined with the statute law constructed by successive Sultans. As from May 1, 1924, however, the whole of the old code was abolished and the religious sanctions removed. A new judicial system was organised on a secular basis and in 1926 a Civil Code was established based and modelled upon the present Swiss code. The courts are now classified into (1) Police or local justice courts administered by Justices of the Peace, (2) District Courts under a President and two Judges with civil and criminal powers that concern marriage and divorce, probate and civil rights, (3) Assize Courts under a President and four Judges for serious criminal cases and finally (4) the Court of Cassation which is the only court of appeal. This latter is situated at Eskishehir in Asia Minor and is independent of Angora and Constantinople.

Ministers and high state officials are tried by a High Court composed of eleven members of the Court of Cassation and ten members of the Council of State.

There are in all some 600 police courts of which 160 are in villages. Independent of all these courts are the two Tribunals of Independence which are arbitrary judicial bodies in perpetual session but without any fixed place of session. They are like travelling assizes but their purpose is mainly political and they are the consequence of the dictatorship by which the country is really governed. Each consists of a board of three judges and they are similar to courts martial since their origin and methods are mainly military. In essence they override the law of the land as otherwise administered. Trials, however, by these courts are in public and penalties inflicted are according to the existing laws

as far as possible. They are under the control of the National Assembly in theory but in fact more the instruments of the President of the Republic. They exist primarily to combat political and military conspiracies, mutiny, treason and desertion. In 1926 some 17 well known persons were condemned to death and hanged by the decisions of these tribunals as being concerned in a plot against the republic. These tribunals were, however, suspended in March 1927, though they can be reconstituted.

The change in the civil code has been followed by the abolition of polygamy and by the grant to women of equal rights in divorce and marriage, though their political status is still unchanged. In divorce in particular there have been established enactments of considerable wisdom and breadth of mind.

Foreigners are guaranteed equal rights with Turkish citizens in the law but they have neither superior status nor privileges except in certain matters of personal rights and status.

In detail the dress regulations which have the sanction of law are as follows. All officials except those to whom special uniforms are assigned must wear western costume. In the National Assembly frock coats are obligatory and the President must wear dress clothes and a top-hat. The fez and turban are abolished. Women are not so strictly disciplined. The veil is still seen frequently in Constantinople and also in the provinces although the general custom, however, is to wear a headdress of a type based upon the modern Russian.

Tenure of Property.—Real property is held in one of four various ways: either *mulk, emiriyē, vakuf* or *khaliyē*. (1) *Mulk* is the absolute property of its owner, and can be disposed of by him as he wills without restrictions, save those enumerated lower down (*General Dispositions*) as general for all the four classes. (2) *Emiriyē* is practically "public domains." The state may grant land of this category to private persons on payment by the latter of the value of the proprietary right—the tithes, ground-rent (should there be private buildings upon it), and the land-tax. *Emiriyē* cannot be mortgaged, but can be given as security for debt on condition that it be restored when the debt has been repaid; no forced sale may take place after the decease of the debtor. *Emiriyē* is not transmissible by will, but may be transferred by donation, which returns to the donor should he outlive the beneficiary. Should a proprietor of *emiriyē* plant trees or vines, or erect buildings upon it, with the consent of the state, they are considered as *mulk*. The *emiriyē* then becomes *mulk*, with certain restrictions as to transfer dues. A transfer duty of 5% on the estimated value of *emiriyē* is paid on transmission by sale, inheritance or donation, of 2½% on the amount of the debt in case of mortgage or release from mortgage, and of 10% on expenses of registration. A different scale is established for *emiriyē* with *moukataa* (rent paid for *emiriyē* with *mulk* property established upon it). (3) *Vakuf* is "all property dedicated to God, of which the revenue is consecrated to His Poor"; or "property of which the usufruct, such as tithe, taxes and rents, is attributed to a work of charity and of public interest." When once a property has been registered as *vakuf* it can never be withdrawn. There are two classes of *vakuf:* (*a*) Land so declared either directly by the sovereign or in virtue of imperial authority under past régimes; (*b*) lands transformed by their properties from *mulk* into *vakut*. The laws and regulations concerning *vakuf* are too intricate to be described; generally it may be said that they form a great obstruction to dealing with a large proportion of the most valuable property in Turkey, and therefore to the prosperity of the country. The *vakufs* are administered by a special ministerial department (*evkaf nazareti*), whose property on behalf of the state, they theoretically are. (4) *Khaliyē*. This property is also styled *mevad*. It consists of uncultivated or rough lands, such as mountains, stony ground, etc., which are useless without clearance, to which no possession is claimed, and which are at such a distance from the nearest dwelling that the human voice cannot be made to reach them from that dwelling. Any one can obtain a gratuitous permit to clear and cultivate such lands; the laws governing ordinary agricultural lands then apply to them. The permit is withdrawn if the clearance is not effected within three years. If the clearance is effected without the necessary permit, the land is nevertheless granted on appl tion, and on the payment of the *tapu* or sum paid by the prop tor to the state for the value of the land.

Agriculture.—In all only about 20% of the total area Turkey is under cultivation. But since 1925 zones of developm with Directors of Agriculture have been formed for the furt development of the country. Further the Agricultural bank been established upon a state-controlled footing, in order to fa tate loans to local groups and individuals. Agricultural sch have also been established where free struction is given. In all some three h dred thousand refugees from the old pr inces of Turkey in Europe have been tled and all tithe payments have b abolished. The latter reform was effe in February 1925 and in its place a sys of land-taxation fixed which is based ra upon the productive than upon the area the soil. At the same time a modified f of land-tax survives in the shape of a per thousand tax on land values ba upon the registered value of lands as tablished in the year 1915.

BY COURTESY OF GERLINGS

A PORTER CARRYING A LOAD ACROSS THE GOLDEN HORN PONTOON BRIDGE

The most important agricultural prod of Turkey is tobacco. The value of crop exported in 1922–24 exceeded 20% all other exports. But in 1926 quantity exported was below expectat Tobacco is grown throughout Turkey varies greatly in quality. The best co from the Pontic coast near Samsoun also from Bafra, Sinope and Trebizond. Samsoun tobacco fet the highest price at 200–250 piastres the kilogramme; that f the marmora region the lowest at 70–95 piastres. Smyrna toba is largely bought by Germany. In 1925 the Government tra formed the "Régie des tabacs" into a State Monopoly, and at same time made a monopoly for cigarette-paper. The Un States of America are the largest purchasers of Turkish toba grown in Turkey. The consumption within Turkey itself is ab 10 million kilogrammes.

Cereals are not a very large crop and suffice only to pro three-quarters of the needs of the population. Angora, Si Kastamuni and Konia are the chief corn-producing areas.

Cotton is largely grown in the south of Asia Minor, near Ada where some million and a quarter acres are under cultivat Near Smyrna also there is a growing cotton industry, and 1925 some 40,000 bales were produced, which amount is alm the same as the pre-war output.

Figs as an article of commerce in Turkey come exclusiv from the Smyrna region. The average annual output is ab 25,000 tons. Nuts are extensively grown in the Pontic district the wooded belt. The Trebizond crop in 1925 was some 25, tons valued at nearly a million pounds sterling. America is principal customer and they are bought mainly by chocol manufacturers. Filberts, walnuts, chestnuts and almonds are chief nuts exported.

With Italy, Spain and Greece, Turkey is one of the chief porters of olive oil. The Brusa region and the Ionian coast the principal areas of cultivation. Some 40,000 tons of oil w prepared in 1925, but the methods of extraction are still primit and the war damage in the olive-growing regions was extensi

Opium poppies are grown in the Smyrna, Malatia and To regions and the average yield is some 3,000 to 5,000 cases, a la decrease on pre-war years. The opium so produced is alm wholly exported for medicinal uses, principally to Holland.

Sugar beet is a wholly new crop for Turkey. A company been founded with a capital of LT 300,000 and there are factor constructed during the last three years at Alpulu in east Thrace and at Ushak. The former can deal with 150 and latter with 500 tons of beet a day. The factories and the comp involved has special government protection and exemption fr taxation. Considerable quantities of sugar are now being refi

ocal consumption.

ne silk industry, being one of those which relied upon the ed work of Greeks and Armenians, is virtually dying. There now only 42 factories as compared with the 160 of 1914.

livestock the country is rich and the pastures are good. In nearly 13,000,000 sheep, 5,000,000 cattle and 500,000 buffa- were recorded. The Angora goat which still thrives on the nds of the plateau is one of the most profitable of all live- k in Turkey. 2,760,502 were recorded in 1926 whereas there only a million and a half in 1924. The export of mohair ved from their skins is almost exclusively to Great Britain.

orests.—Nearly 9% of the total area of Turkey-in-Asia is st land, covering an area of some 25,419 square miles. A proportion of Eastern Thrace is under forest and unin- ted, amounting in all to 1,648 square miles. Pines are 37% ne total and oaks 14%. Cedars and beech are common. The ic coast and Cilicia are the most deeply wooded areas. restation is unknown and any scientific knowledge of forestry yet in its infancy. But the concentration of population in towns and coastal areas and the paucity of inhabitants has ented the extreme deforestation that one finds in Greek lands. e is in fact a body of 2,500 officials primarily concerned with stry and an actual school of forestry in Constantinople. The f forests are in the Pontic region near Sinope and near sia. Here they are continuous and dense. In the Taurus they considerable but not so dense.

ineral Wealth.—In coal Turkey, compared with other an lands is relatively rich. The coal-fields of the Eregli on, on the Pontic coast some 150 miles from Constantinople, largely worked and have been productive for over 80 years. ll there are some 80 concessions at work and as much as a on tons has been produced annually. The workings are ly open and on the sides of cliffs. There is another group of es in the bay of Kozlu some 18 miles to the east. Further g still is Zunguldak, served by a modernised port. The mines are some 5 miles inland. Other coal-bearing regions exist further to the east. An annual average for the mines of all districts together, omitting Eregli, has been estimated at 000 tons. The only other coal-fields are in the Erzerum dis- , but owing to the disturbed state of this region and its imity to the Russian frontier it is doubtful if they are now ted. Eregli coal is the best. Lignite is found at many places natolia and also at Keshan on the sea of Marmora. Other erals are gold, found in the Taurus and in the Smyrna and a regions, but not now worked; silver, principally in the rus; zinc, tin, sulphur, salt, and mercury. The petroleum osits in Erzerum are not worked.

one rare mineral Turkey has what amounts to a world opoly—meerschaum. It is found in the valley of the river ak in the Eski Shehir district. The present Government has n to organise the mining for this mineral on a regular and e scientific basis. Five main quarries in an area of 100 m. are worked. In 1923 33,738 kilogrammes were exported, estimated worth being LT 51,150. In 1924 the export had eased. Italy, Germany and Austria are the chief purchasers.

opper is the mineral in which Turkey can be said to be est. There is one large field at Arghana, near Diarbekir on Iraq-Syrian frontier. The total deposit here has been esti- ed at 1,600,000 tons. The ore is first treated in furnaces at hana and later refined at Tokat. It is ultimately exported n Samsun on the Black Sea. The mines are Government perty and have yet to be fully and scientifically exploited. The rage yield of copper in the ore from Arghana is 16%. Other per deposits are in the Kars, Trebizond, Sinope and Smyrna ons.

Manganese, which is plentiful in the Caucasus, is found in the rmora region near the Balia Maaden mines. It also occurs r Eregli and in the Smyrna region. Fifty-one concessions are xistence but so far little exploitation has taken place.

mery is found in the Smyrna and Aidin regions, and is worked British and American Companies.

isheries.—These constitute an important contribution to the wealth of the country. The passage through the Bosporus from the Black Sea of very large quantities of fish gives opportunities for fishing in the narrow and controlled Bosporan waters which are of incalculable value if properly exploited. Byzantium and Chalcedon (on the site of Moda) owed their wealth and their foundation to this source. Anchovies, mullet, sturgeon and tunny are the principal fish of value which come from the Black Sea to the Bosporus. Sword-fish, a coarser type, is a further addition, its flesh being greatly prized by those who cannot afford meat. Oysters, mussels, lobsters and prawns are common along the shores of Marmora and at the Princes' Islands.

No very accurate statistics are available since the industry is entirely without organisation, but in 1922–3 the total amount of fish caught was estimated at 22,000 tons. The Bosporus fisheries are further said to be worth £250,000 per annum.

The destruction or departure of the Greek population has deprived Turkey of the bulk of its expert fishermen, so that it may be assumed that before 1921 the value of the fisheries was considerably greater.

Communications.—Turkey-in-Europe is well served with railways. The main line which conveys the Orient Express and all other European traffic to Constantinople has branches from Alapie to Kirk Kilisse and from Muradli to Rodosto on the Sea of Marmora. From Haidar Pasha station on the Asiatic shore of the Bosporus a main line runs to Ismid, Eski-Shehir and Angora, bearing considerable traffic. From Angora eastwards a line has recently been constructed to Kaisariyeh (Caesarea), being some 500 kilometres in length. The section Angora-Kaisariyeh was opened to traffic in June 1927. A continuation to Sivas is now under construction by a Franco-Belgian company and a further extension from Sivas to Samsoun on the Black Sea, also now under construction, will complete an extensive policy of railway expansion, which was begun in 1923 after the establishment of the new Republic.

From Eski-Shehir a main line runs southwards past Kutahia to Afium Karahissar, whence a branch runs to Smyrna. From this junction it continues to Konia and Adana across the Taurus range. Just east of Adana it enters Syria and so continues to Cairo on the one hand and in the direction of Mosul and Baghdad on the other. Through connections can now be made from Paris to Cairo by coaches which are ferried across the Bosporus from Stamboul to Haidar Pasha.

From Smyrna a line runs north to Panderma on the Sea of Marmora and south to Odemish, to Sokia, to Aidin and Egirdir.

A light line existed before the war from Erzingan to Erzerum, Kars and Alexandropol, but it is not known whether it is still in use.

The main policy of the Turkish government at present is to construct lines which will favour the commercial development of Anatolia and the export to ports of its produce. Guarantee bonds to a maximus of LT 200,000,000 have been issued to cover this railway, port development and survey scheme.

Shipping and Commerce.—By the Lausanne Treaty the right of cabotage (coastwise shipping) is confined to Turkish ships, and as a result of this provision Turkish ships have increased in numbers, but their progress is hindered by the shortage of credit. In 1925 the number of Turkish steamships was 170 of 95,286 tons and the number of sailing vessels 3,745 of 115,767 tons. In 1927 the former total had increased to 186,986 tons.

The following table sets out the port traffic in 1924 at the principal ports:—

Port and dependencies	Turkish ships		Foreign ships	
	No.	Tonnage	No.	Tonnage
Constantinople	30,146	1,833,971	4,019	5,445,110
Smyrna	8,451	616,355	2,330	1,356,566
Samsoun	19,949	3,541,060	493	856,041
Mersin	5,802	257,439	2,112	736,550
	64,348	6,248,825	8,954	8,394,267

The principal exports of Turkey are tobacco, dried fruits, cotton, wool, mohair, opium, hazel nuts, valones and liquorice

root. Corn is not yet produced in sufficient quantities to permit of export and there are no manufactured articles made in Turkey which are required by other countries.

State monopolies are as follows: tobacco, sugar, petroleum and benzine, all forms of alcohol, salt, sporting gun cartridges, industrial explosives and matches. The tobacco monopoly is of pre-war date, but that in sugar and petroleum began in 1926. These last do not mean that there is any restriction in import but only that the monopoly tax has to be paid on every import of these articles. On the other hand, the import of salt is prohibited, while that of matches is regulated by a Belgian company to whom the monopoly was ceded. The monopoly in alcohol was ceded to a Polish syndicate, but the whole question of this monopoly is now under consideration with a view to revision. Cartridges and explosives are in the hands of a Turkish company, through whom all orders are passed.

The following tables show the values of the chief imports and exports and their distribution:—

Imports and Exports by Commodities

	1924		1925	
	Imports	Exports	Imports	Exports
Cereals	23,005,732	5,425,467	23,051,092	5,578,458
Tobacco	..	46,581,432	..	60,984,421
Fruit, etc.	..	39,477,850	..	37,617,682
Cotton goods	63,571,483	11,947,999	74,127,634	15,476,821
Woolen „	13,263,837	13,170,269	17,625,521	11,548,110
Metals	16,168,158	4,319,269	21,556,078	3,757,258

Direction of Foreign Trade

Russia	6,369,307	6,101,597	2,005,323	4,901,691

Ports.—The port of Constantinople consists of a war harbour, an inner and an outer port.

Posts and Telegraphs.—In 1874 Turkey became a member of the International Postal Convention, but six powers maintained their own post offices until the abolition of the Capitulations. The reason for this was the complete unreliability of the postal services. After the evacuation of the city of Constantinople by the Allied forces in 1923, the whole of the postal services were taken over by the Turks. The results have, however, been far from satisfactory, since the reliability of the system employed and of the postal servants is not great. There are in all 714 post offices in Turkey.

The telegraphic service is under the control of the Postal Department, and the Eastern Telegraph Company has again established itself after a prolonged dispute. The cables owned by this company that serve Turkey are (1) that from Syra to Chanak on the Dardanelles and so to Constantinople, (2) the Salonika-Lemnos-Tenedos-Dardanelles route, (3) that from Chesme to Tenedos and Chios and (4) that from Constantinople via the Black Sea to Odessa.

Three wireless stations exist—at the Ok Meidan above the Golden Horn, at Osmanieh some four miles from Constantinople in the open country west of Pera, and at Angora. Private wireless sets are now licensed but transmitting sets forbidden. The annual private license costs some three English pounds.

There is only one commercial aeroplane service, namely that from Rome via Brindisi, Athens and the Dardanelles to Constantinople. It is manned by hydroplanes, which harbour in the Bosporus near Therapia. It is, weather permitting, a daily service. A Turkish aviation league, primarily with military objects, exists for the purpose of stimulating interest in aviation.

The telephone service of Constantinople is controlled by Anglo-French company under an English director, with a cap of £450,000, of which £250,000 is paid up. The Turkish Gove ment exacts a percentage of 15% on gross revenue. There are so 4,000 subscribers in Constantinople and its suburbs. Ang enjoys an automatic telephone system and the rest of the coun is covered by a State system.

FINANCE

Maladministration under Abdul Hamid followed by the asters of the Italian war of 1911 and the Balkan war of 1 and the Great War from 1914 to 1918, has plunged the finan of Turkey into difficulties such as no other country now fa Nevertheless, the fact that there has been no financial crisis c parable to those in Germany and Austria after the war is markable and it is noteworthy that the Turkish Lire that bef the war was almost the equivalent of the English pound in va was in 1919 of an exchange value of about 1·50 LT to the po sterling, while since then it has sunk slowly to about 9·50, which figure it now remains. The budget presented to National Assembly in 1925–26 showed a Revenue of LT 145,3 978 and an expenditure of LT 162,228,942, with a consequ deficit of LT 16,981,964. But after the budget had passed Assembly the expenditure was increased by nearly three mil Turkish pounds and the revenue was shown as slightly decrea with a consequent deficit of LT 30,885,873.

The budget for 1926–27 shows an estimated expenditure LT 188,141,708, but the revenue is not yet known.

National defence is by far the largest item of expense. 1924–25 it cost LT 26,279,386, in 1925–26 LT 43,058,874 and 1926–27 LT 57,996,143. This progressive increase follows to so extent the progressive prosperity of the country but the exper ture on armed forces still remains extremely high, being well o twice the expenditure on public works (the next largest item) the last two years. And while it was about a quarter of the wh expenditure in 1924–25 it is almost a third in 1926–27. Anot non-productive expense, which only appears first in 1925–26 that on military factories, which in that year is some four mill Turkish pounds and in the estimates for the next year increa by a million. Gendarmerie also costs an average of ten mill Turkish pounds, without much annual variation. On the ot hand, the expenditure on public works shows a small but ste increase in three years from 17 to 22½ million Turkish pou Education, however, which in 1924–25 cost LT 6,877,626, decreased in 1926–27 to LT 6,000,184.

The financial situation of Turkey is complicated by her herit from the past. While paying no reparations for the war of 19 18 she is still saddled by a very large foreign debt.

Foreign Debt.—In 1875 the financial condition of Turkish Empire had become so serious that payment in full interest on existing foreign loans was suspended and it was nounced that 50% only would be paid, the remainder being iss as certificates known as "Ramazans," being 5% bonds matur in five years. In 1881 the bondholders began negotiations Constantinople for the further payment of their claims. "Decree of Muharrem," issued on Dec. 20, 1881, made arran ments for the reduction of the debt from £252,801,805 to £1 437,234. A minimum of 1% was fixed as interest on this s to be increased as opportunity offered. But an International b was appointed to supervise the administration of the debt kno as the "Council of Administration of the Ottoman Public Deb and it was composed of one member each from Great Brit Austria-Hungary, France, Germany, Italy and Turkey and from the Imperial Ottoman Bank. This council had charge of duties on spirits, stamps, silk, salt and some other reven assigned for payment of interest on the debt. In 1914, howe all payments ceased and Turkey entered the war. On the est lishment of the National Assembly all these revenues assig to the debt were taken over for purposes of revenue to the Turk budget, so that between 1914 and 1924 virtually no payments interest to bondholders were made by the Turkish authorit But in 1920 the Debt Council, from accumulated funds, were a

ke some small payments on coupons that had matured be- 1915 and 1920 and further payments have been made on ns up to 1922.

the Treaty of Lausanne, which came into force in 1924, rritories detached from Turkey as a result of the War were upon to contribute to the Ottoman debt, which at that was estimated at LT 141,666,299. Of this sum the New y was responsible for LT 84,597,495. Albania, the Hejaz, Nejd, Maan, Palestine, Trans-Jordan and parts of Asiatic y now incorporated in Greece, Bulgaria and Yugoslavia sponsible for the substantial contributions. But so far the provinces to whom payments were so assigned which have made arrangements to pay, or paid, are Palestine (whose ent was partial only), Syria, Lebanon and Greece.

xation.—The present Government is deriving most of its ue from direct taxation, which, on the whole shows a tend- to increase. Customs tariffs are not high and the bulk of axation is internal. Indirect taxes are also very heavy and rosperity of the country is suffering from the inability of nterprises to survive the rigours of taxation in their early .. Bankruptcies have been more frequent in 1928 than in and there is not so marked a growth of prosperity as was at between 1922 and 1926.

xation per head of the population is some LT 20 (about), which is relatively low compared with that of Great Britain 14.0 per head), France (£5.10.0), Germany (£5.0.0), Greece .0) or Bulgaria (£2.0.0), but it is high for a country so organized as Turkey. The direct taxes are income tax, tax and road tax. The agricultural tithe of 12½% was hed in 1925. In 1927 an aviation tax for the provision of for the formation of an air force was levied at the rate % added to all tax payments. Income tax is levied at the of 6% on all incomes up to LT 3,000, rising by a sliding to 14% on incomes above LT 50,000. Certain exemptions anted to farmers, writers, teachers and other professional s.

1926 a consumption tax at 2½% was levied on all pur- s in shops, restaurants and hotels, and it is still in force. It payable by stamps affixed to all receipts for purchases.

LIOGRAPHY.—1. *Topography, Travels, etc.*: The works of J. B. nier, of Richard Knolles and Sir P. Ryeaut, of O.G. de Busbecq equius), Sir T. Hanway, the Chevalier Jean Chardin, D. Sestine W. Eton (*Survey of the Turkish Empire*, 3rd ed., 1801) are ouses of information on Turkey from the 16th century to the f the 18th. More recent works of value are those of J. H. A. ni, *Lettres sur la Turquie* (1853–1854) Eng. trans. (2 vols., 1856); quhart, *The Spirit of the East* (2 vols., 1838); A. W. Kinglake ially his *Eothen*, 1844); A. H. Layard, H. F. Tozer, E. Spencer, Boué, A. Vambéry and Sir W. M. Ramsay. Sir C. Elliot's *Turkey-rope* (London, 1907) is comprehensive and accurate. *See* also Laveleye, *La Péninsule des Balkans* (Brussels, 1886); V. Cuinet, *urquie d'Asie* (5 vols., 1891–1894, and index 1900); id. *Syrie et Palestine* (1896–1898); W. Miller, *Travels and Politics in the East* (1898); Lord Warkworth, *Notes from a Diary in Asiatic y* (1898); Mark Sykes, *Dar-el-Islam* (1903); D. Fraser, *The Cut to India* (1909); E. G. Mears, Modern Turkey, exhaustive, bibliographies (1924); H. G. Dwight, Constantinople: settings traits (1926); E. Mambourg, Constantinople, Tourists' guide stantinople, 1927). For information concerning Turkey for the d before 1914, the following may be mentioned in addition:— monumental *Geschichte des Osmanischen Reiches*, by J. von mer Purgstall (1st ed., 10 vols., Vienna, 1827–1835; 2nd ed., 4 Pest, 1840; French trans., by J. J. Hellert, 18 vols., Paris, 1835–, is still the standard work until the conclusion of the treaty of uk Kai'narji (1744), at which date it stops. Founded upon it are . S. Creasy's *History of the Ottoman Turks* (London, 1878) and ne-Poole's *Turkey* in the "Story of the Nations Series" (London,); Sutherland Menzies's *Turkey, Old and New* (2 vols., 1880) is ed chiefly from French sources and is less accurate and unbiased. xcellent and impartial history in Turkish is the *Tarikh-i-devlet-i-nié*, by Abdurrahman Sheref (Constantinople, A.H. 1315–1318= 1897–1900). *The Balkans*, by W. Miller (London, 1899), in the y of the Nations Series," deals with Turkey's relations with the an states. Halil Ganem's *Les Sultans ottomans* (2 vols., Paris,) contains much that is interesting. Much information on modern ish history and politics will be found in the works dealing pri- y with topography, finance, law and defence, which have been above. *See* also S. Lane-Poole, *Life of Lord Stratford de Red-* (2 vols., London, 1888); A. Vandal, *Mémoires du marquis de Nointel* (French ambassador at Constantinople from 1670 to 1678); E. Engelhardt, *La Turquie et le Tanzimat* (Paris, 1882); E. Driault, *La Question d'orient depuis ses origines jusqu'à nos jours* (Paris, 1898); F. Belin, *Essais sur l'histoire économique de la Turquie* (1865); Aristarchi Bey, *Législation ottomane* (8 vols., Constantinople, 1868–1876); R. Bourke, *Report to the British and Dutch Bondholders* (1882); O. Haupt, *L'Histoire monétaire de notre temps* (1886); F. Ongley and H. A. Miller, *Ottoman Land Code* (1892); *Medjellé* (*Ottoman Civil Code*) (Nicosia, 1895); Kendall, *Turkish Bonds* (London, 1898); V. Caillard, Babington-Smith and Block, *Reports on the Ottoman Public Debt* (1884–1898, 1899–1902, 1903–1910); *Annuaire oriental du commerce* (Constantinople); *Journal de la chambre de commerce* (Constantinople, weekly); *Annual Report of the Régie Co-intéressée des Tabacs* (Constantinople); *Annual Report of the Council of Foreign Bondholders;* C. Young, *Corps de droit ottoman* (7 vols., 1905–1906); Pech, *Manuel des sociétés anonymes fonctionnant en Turquie* (1906); Alexis Bey, *Statistique des principaux résultats des chemins de fer de l'empire ottoman* (Constantinople, 1909). (S. CA.)

DEFENCE

The writers who have left the most complete and trustworthy contemporary accounts of the Turkish army in the 14th and 15th centuries, when it reached the height of its most characteristic development, are Bertrandon de la Brocquière, equerry to Philip the Good, duke of Burgundy, and Francesco Filelfo (*q.v.*) of Tolentino. Both ascribe the military superiority of the Turks over the nations of western Europe to two facts—firstly to their possession of a well-organized standing army, an institution unknown elsewhere, and secondly to their far stricter discipline.

The regular troops comprised the Janissaries (*q.v.*), a corps of infantry recruited from captured sons of Christians, and trained to form a privileged caste of scientific soldiers and religious fanatics; and the Spahis, a body of cavalry similarly recruited, and armed with scimitar, mace and bow. Celibacy was one of the rules of this standing army, which, in its semi-monastic ideals and constitution, resembled the knightly orders of the West in their prime. The Janissaries numbered about 12,000, the Spahis about 8,000. A second army of some 40,000 men, mostly mounted and armed like the Spahis, was feudal in character, and consisted chiefly of the personal followers of the Moslem nobility; more than half its numbers were recruited in Europe. This force of 60,000 trained soldiers was accompanied by a horde of irregulars, levied chiefly among the barbarous mountaineers of the Balkans and Asia Minor. Many Christian soldiers of fortune enlisted with the Turks as artillerists or engineers, and supplied them at Constantinople with the most powerful cannon of the age. Other Christians were compelled to serve as engineers or in the ranks. As late as 1683 a corps of Wallachians was forced to join the Turkish army before Vienna, and entrusted with the task of bridging the Danube. But in the 18th and early 19th centuries the introduction of Christians tended to weaken the *moral* of the army already sapped by defeat; it was found impossible to maintain the discipline of the Janissaries, whose privileges had become a source of danger; and the feudal nobility became more and more independent of the sultan's authority. These three causes contributed to make reorganization inevitable.

The destruction of the janissaries in 1826 marked the close of the history of the old Turkish army; already the re-creation of the service on the accepted models of western Europe had been commenced. This was still incomplete when the new force was called upon to meet the Russians in 1828, and though the army displayed its accustomed bravery, its defective organization and other causes led to its defeat. Since then the army has been almost as constantly on active service as the British; the Crimean War, the Russo-Turkish War of 1877, the Greco-Turkish War of 1897 and the Italo-Turkish War of 1911 witnessed the employment of a large proportion of the sultan's available forces, while innumerable local revolts in different parts of the empire called for great exertions, and often for fierce fighting on the part of the troops locally in garrison and those sent up from the nearest provinces. Finally, the Turkish army made its greatest effort in the World War (*q.v.*), where, despite administrative inefficiency and corruption on the one hand, and the defective equipment and handling of the fighting troops on the other, it earned the admiration of its

opponents by its stubborn endurance and resistance. German leadership played a considerable part in its early success at the Dardanelles (*q.v.*), and to a less degree in other theatres, but friction between the German and Turkish officers became an increasing handicap. The results were aggravated because the Turkish army threw up only a few leaders, of whom Mustafa Kemal (*q.v.*) was the most notable. But round him gathered a nucleus of better trained younger officers, and after the disasters which marked for Turkey the close of the World War, it was the influence of this new school which brought about the rapid recovery of the Turkish army, shown in the expulsion of the Greek forces from Asia Minor.

MODERN ARMY

Art. 40 of the constitution of Turkey states that, "The supreme command of the army is vested in the moral personality of the Great National Assembly and is exercised by the President of the Republic. In time of peace the command of the military forces is entrusted to the chief of the general staff within the limits of the corresponding laws. In time of mobilization the command of the armed forces is entrusted to a person nominated by the President at the proposition of the Council of Commissars."

The land forces of the Turkish Republic in time of peace amount to: 163 infantry battalions, 42 field, 44 mountain, 5 howitzer and 27 heavy artillery batteries; 48 cavalry squadrons, 13 machine-gun mounted companies; 29 pioneer companies, 8 transport companies, 3 radiotelegraphic companies, 1 light-projector company and 8 field hospitals. These forces are formed in 18 infantry and 5 cavalry divisions composing the IX. Army Corps, distributed over 3 military inspection regions. Each of these comprises 2 to 4 army corps, and is under a chief who is the designated commander of the corresponding army on mobilization. An army corps is normally composed of 2 infantry divisions, 1 heavy artillery regiment of 2 to 4 batteries, 1 squadron of corps cavalry, 1 technical company, 1 transport company, 1 automobile company and 1 company for communications and liaison. The VIII. Army Corps has no heavy artillery. An infantry division has 3 infantry regiments of 3 battalions and 3 machine-gun companies each, 1 artillery regiment of 2 field and 2 mountain batteries, 1 pioneer company and 1 company for communications and liaison. The first 9 divisions are numbered from 1 to 9, while the remaining 9 divisions bear different numbers, inherited from the old organization. A cavalry division is composed of 3 cavalry regiments of 3 squadrons, 1 machine-gun mounted company and 1 to 2 mountain batteries each. The numeration of the cavalry divisions is also inherited from the old organization.

The distribution of these forces is as follows:—

Military Inspection Region	*Army Corps and Headquarters*
1st Angora	II. Balikesir
	III. Constantinople
	IV. Eskishehr
2nd Konia	I. Afiun Qarahisar
	V. Konia
3rd Diarbekr	VI. Toqat
	VII. Diarbekr
	VIII. Erzinjan
	IX. Sariqamish
1st Cavalry Division	Jeziret Ibn 'Omar (North of Mosul)
2nd Cavalry Division	Kirk-Kilisse (Thrace)
7th Cavalry Division	Qara Kilissa (Anatolia)
8th Cavalry Division	Van
14th Cavalry Division	Urfa (Turkish Mesopotamia)

In addition, the following other forces exist within the framework of the army corps:—

1. The National Guard of the Great National Assembly, consisting of 1 infantry battalion, 1 machine-gun company and 1 cavalry squadron.

2. 4 frontier commissariats of 4 battalions and 4 machine-gun companies each, in Artvin, Diarbekr, Adana and Adrianople.

3. 40 heavy batteries and technical units for the fortified places, namely; Smyrna, 8 batteries, 1 projector company and 1 pioneer company; Kars, 12 batteries, 1 pioneer company and 1 liaison company; Erzerum, 20 batteries and 1 liaison company; Chat 8 batteries.

4. 16 batteries of coast artillery, at Samsun and other pc

5. 1 railway battalion, 1 pioneer and 1 liaison company.

Service in the army is obligatory. Its duration is 1½ yea the infantry and transport, 4 years for the navy and 2 years all other arms.

The Gendarmerie represents a force of about 25–30,000 organized in 9 flying gendarmerie battalions and numerous panies, platoons and posts. There are also 5 mounted gendarm regiments, one each at Angora, Chorum, Yozghad, El 'Aziz Erzinjan respectively. The recruiting is on a voluntary basis.

The equipment of the army is satisfactory, but it is not form. The rifles are of diverse types. The number of auton rifles is only 1,200 to 1,300. The machine-guns are altoge about 800, *i.e.*, 40 for each division. The field guns are estim to be about 600 to 650, but the reserve of shells is low. cartridge factory in Angora is being steadily developed, but production is insufficient.

Air Service.—The air service numbers 13 incomplete sq rons of 8 aeroplanes each, 2 schools for aviation (land and na in Smyrna. The instructors are French officers. The air unit concentrated in Smyrna, where there are 7 hangars for aeropl others are being planned for construction at Afiun Qarah Mersina, Constantinople and Erzerum. A workshop for re exists also in Smyrna. The organization of the meteorolo service is not completed as yet and is to include 24 meteorolo stations. The service will have the assistance of the existing ra telegraphic stations and those under construction in Const nople, Smyrna, Qastamuni, Gallipoli, Sivas, Angora, Eskis and Konia. Much attention is being given to the developmer the air forces by the authorities and the public alike, who are ing donations and subscriptions for this end. The air ser for postal and passenger service are only in embryo.

Navy.—The naval forces are in an unsatisfactory condi By the end of the World War the fleet numbered about 20 u thanks to the German battle cruiser "Goeben" (which passe Turkey in 1914) and some torpedo boats. By the Sèvres Tr only about 10 unimportant units were left to Turkey. By Lausanne Treaty, however, Turkey got back the remnants o fleet and moreover the liberty for further armaments. Tu intends to entrust to a Japanese mission the development o fleet, within the limits and necessities of a mobile defence to plement the coast defence. To this end it is intended to repair arm anew the cruisers "Goeben," "Hamidiye," seven gun-b two submarines and three torpedo boats. Further, within a pe of 8 years, the construction is intended of 2 battleships, 2 cru of 10,000 tons each, 2 cruisers of 7,500 tons each, 4 destroyer torpedo boats (of 800 to 1,000 tons each), 4 submarines u 1,200 tons each and 6 mine-layers. A sea dock is planned construction at Izmid, where an inlet of the Sea of Marmora the shape of an easily defensible fjord. Two more naval avia schools are planned (besides that in Smyrna); one in Const nople and another in Trebizond, and 4 hydroplane stations. In present situation the fleet can be used only for a defensive pose, owing to its numerical and technical weakness and to coastline of nearly 4,000 kilometres that has to be defended, e cially the Aegean coast line where the opposite islands are in hands of foreign states; but in the Black Sea it might to s extent take the offensive.

The mercantile fleet is developing rapidly in consequence of provision in the Lausanne Treaty that the coastal and port s ices, as well as the fishing, are an exclusive privilege to Turkish national flag, though exceptions have been made in case of certain well-known lines. The steamship company "S Sefain" alone possesses a fleet of 60 units.

The New Turkey.—Sport and scout organizations are m in favour now all over Turkey, and are helped by the authori Other facts of a general character that are important from a m tary point of view are the reforms of Mustafa Kemal, which at the rousing of national pride and feeling by abolishing obs religious and political prejudices and introducing up-to-

nods. Moreover, the emigration and expulsion of the ethni- minorities have given a homogeneous basis to the State, and nis respect only the Kurds in the regions of the Mosul fron- remain as a source of disquiet for the Turks.

opography.—From a topographical point of view, the salient ure of Asiatic Turkey is that it is a plateau, surrounded on e sides by the sea and by high ranges of mountains. This tes a double line of defence, one on the sea coast and another he mountain ranges, especially on the northern and southern is. The western coast, with its parallel valleys between the and the range of the inland plateau, is the more accessible one. he east the plateau is guarded by the high Armenian moun- s, extending far towards Persia and the Caucasus.

orth-eastern Theatre.—Against an enemy coming from the casus and the Black Sea, the defence of Turkey is highly ured by the mountainous character of the territory. There our roads from Russia to Turkey. The first is along the coast, n Batum (terminus of the railway from Tiflis) to Trebizond. asses between the coast and the mountain range of Lazistan is not easy for movements. The second is from Batum and along the valley of the river Chorokh in the direction of Bai- . The third route is the classical road from Alexandretta on Mediterranean to Tiflis and the basin of the Caspian Sea. At rum it is crossed by the other classical road from Tehran Trebizond. The railways Tiflis-Alexandropol-Kars-Erzerum, riz-Nakhichevan-Alexandropol and the branch line Nakhiche- Bayazid-Alashkerd are highly important in this respect and e possible military action on an extensive scale.

he defence is favoured further by the fact that both Kars and rum are successive fortresses. The railway, Angora-Qaisari- s-Erzinjan-Erzerum, will assist the defence if constructed. fourth route, giving access to Armenia and Kurdistan, runs n Erivan through Bayazid, and through the valley of the ad-Tchai (upper course of the Euphrates) arrives at Melaz- , from where there are roads from Erzerum, Bitlis, Diarbekr Kharput.

hracian Theatre.—Owing to the demilitarized zones along frontiers with Greece and Bulgaria and on the Straits (Bos- us and Dardanelles), the defence of Thrace is important in the e of a tête-de-pont, serving for the defence of Asia Minor f, along the important water line Bosporus-Marmora Sea- danelles, on its European side. A defence far in the interior the coast of the Sea of Marmora, *i.e.*, at Adrianople and rli, in some respects might be useful for Turkey, but the its remaining unfortified, the flanks would be highly endan- d. The real line of defence remains the line of the Bosporus Dardanelles. In this respect the Asiatic coast of the Sea of mora has a very important bearing, especially with its numer- fjord-like bays.

egean Theatre.—This coast is more easily accessible for an my than the Black Sea or Mediterranean coast, owing to the harbours and numerous parallel roads to the interior far up plateau. The country, moreover, is the richest of all Asia or, it being the cradle of ancient civilizations. But, although islands off the coast, the Dodecanese, are not in the hands of Turks, with good manoeuvring they might make difficult any ling operation, since good roads and railways are available in e regions.

Mediterranean Front.—This coast, from Maqri to Alexan- ta, has the same features in general as the Black Sea coast, senting a double defence line. In addition, the range of the eau, *i.e.*, the Lycian and Cilician Taurus and the Anti-Taurus higher and steeper, with no good roads for the interior.

Mesopotamian Theatre.—This is divided by the railway na-Mosul into two halves. The northern one, in the possession Turkey, is inhabitable and with sufficient roads. On the north s dominated by the Armenian Taurus, standing between the hrates and Tigris like a snow-covered wall in face of the im- se plains of Syria and Mesopotamia. The possession of this l between Bitlis and Kharput ensures the sally-ports from the tolian plateau towards Aleppo and Mosul. The southern half his theatre includes the territory south of the railway, which is part semi-desert, part of desert and mountainous character. The territory between Birejik-Meskene-mouth of the river Khabur to Jeziret Ibn 'Omar, is of semi-desert character, although yielding good produce. It is inhabited by nomad Arabs and Kurds.

Persian Theatre.—In its northern part it has a first-class route for movement. This is the old road from the Iranian Plateau to the Black Sea, from Tehran, through Tabriz and Bayazid, to Trebizond. The other routes are of secondary importance and do not lead to important centres; besides, they pass often through waste land. From Tehran to Van there are two roads, the one going through Tabriz-Dilman and the other through Urmia-Bash Qal'e. In a general way, this theatre has a relative importance if only for use in connection with operations from the Caucasus to Angora or from Armenia to 'Iraq. (P. Da.)

Navy.—The sea power of Turkey had already decayed when the catastrophe of Sinope in 1853 shattered it completely. From time to time since then efforts have been made, generally, before the World War, with British assistance, to build up a navy, and Abd-ul-Aziz created a sizeable fleet of ironclads, built in British and French yards. But his successor, Abd-ul-Hamid, deliberately reduced the fleet to impotency, because he was afraid that it might turn on him as it had on his predecessor.

In 1910 the Turkish fleet consisted of seven armoured ships, of which the biggest were two ships of the "Torgud Reiss" class of 10,000 tons, armed with six 11 in. guns, originally the battleships "Wiesenberg" and "Wörth." Except for some small gunboats and destroyers no important additions were made to the fleet before the World War. When they took refuge in the Dardanelles Turkey nominally acquired the German battle cruiser "Goeben" and light cruiser "Breslau," but in fact these ships remained German throughout the war. The "Goeben" was badly damaged and ran ashore in the Straits to save her from sinking. She was afterwards salvaged and is still in existence as the "Sultan Selim." The "Breslau" was mined and sank off Imbros.

Repeated efforts have been made by the Turks to put the "Sultan Selim" into a state of repair, but it is doubtful whether she will ever be an efficient fighting unit again. In any case she is now very obsolete compared with modern ships of her class.

The Turkish Navy of to-day (1928) consists of: 1 battleship, 2 old cruisers, 1 old battleship used as a training ship, 3 destroyers, 6 torpedo boats and 8 miscellaneous craft.

A programme of new construction has been drawn up and it is proposed to proceed with it when funds are available. (X.)

ETHNOLOGY

For ethnological purposes it is convenient to group together those parts of the old Ottoman empire usually known as Turkey in Asia, Armenia and Cyprus, the two latter of which formed a kingdom in mediaeval times, and have been long connected.

The racial history of this region is obscure. There are two basal stocks in the population; the oldest is probably a short, long-headed type, akin to the inhabitants of most of the Mediterranean coastal region, and called from this fact Mediterranean. Von Luschan, on the other hand, was of opinion that the oldest inhabitants of the region were the round-headed people he called Armenoids. He found groups of these people living in endogamous communities and never marrying with the outside world. These little groups were all of a single type, and very round-headed, whereas in the normal population there is a great deal of admixture and both types are found side by side. He argued, therefore, that these communities represented the broken relics of former aborigines who had been able to preserve their racial type by strict endogamy, while the newcomers had mixed with the aborigines except in a few cases, and had produced a mixed type. It is true that nowhere in this region is the long-headed type found in any purity, but it seems from a general study of the Armenoid peoples that they are comparatively late comers into the west, and possibly the pure communities on which von Luschan has laid such stress have kept their purity simply by not mixing with the people of the land into which they have come. The earliest graves from this area were opened by Buxton in 1913 (Cyprus). They belong to the middle bronze age, probably the second mil-

lenium B.C. and already at this period the two types are mixed, or possibly at that time were living side by side. At the end of the bronze age the people practised a curious type of cranial deformation, flattening the tops of their heads in childhood, a practice which also appears in Crete and is probably of considerable ethnological significance. Since that time the physical form of the people has not altered materially. The principal groups of this region depend entirely on religious differences, and the practice of a certain type of religion is, or was, in most cases sufficient to determine a man's social status. The Muslims are usually considered to be Turks. The Christians, in general terms, are either Greeks or Armenians. There are also certain minor sects, especially some Crypto-Christians, who practised openly Muslim, and secretly Christian rites, but large numbers of these have now definitely decided on a single religion. There are also certain heretical sects, such as Bektash and Tadchadsky, but these peoples come under the general heading of Greeks or Turks according to whether they are heretical Christians, as in this case, or Muslims.

The social organization is largely dependent on these religious features. The Turks were at least nominally polygamous, the Christians monogamous, and the Turkish women wore the veil. The villages are governed by an elected headman, and frequently in those villages where there are both Greeks and Turks there is a headman for each religion. (For changes in law and custom under Mustafa Kemal Pasha, see *The New Turkey*, p. 615 et seq.)

HISTORY

The first appearance of the Ottoman Turks in history dates from A.D. 1227. In that year a horde, variously estimated at from two to four thousand souls, driven originally from their Central Asian homes by the pressure of Mongol invasion, were returning under their chief Suleiman Shah to their native land. They were crossing the Euphrates, not far from the castle of Jaber, when the drowning of their leader by accident threw confusion into their ranks. Those who had not yet crossed the river refused to follow their brethren and decided to remain under Ertoghrul, son of the drowned leader. Ertoghrul first camped at Jessin, east of Erzerum, but obtained from the Seljukian sultan Ala-ud-din lands near Angora. The help afforded by Ertoghrul to the Seljukian monarch on a critical occasion led to the addition of Sugut to his fief. Here Ertoghrul died in 1288 at the age of 90, being succeeded in the leadership of the tribe by his son Osman. When, exhausted by the onslaughts of Ghazan Mahmud Khan, ruler of Tabriz, and one of Jenghiz Khan's lieutenants, the Seljukian empire was at the point of dissolution, most of its feudatory vassals helped its downfall in the hope of retaining their fiefs as independent sovereigns. Osman remained firm in his allegiance, conquered Karaja Hissar (1295), and received investiture of the lands he thus acquired from the sultan Ala-ud-din Kaikobad II. He became master of Aïnēgeul, Bilejik and Yar Hissar, but it was only after the death of his protector and benefactor Sultan Ala-ud-din II. that Osman declared his independence, and accordingly the Turkish historian dates the foundation of the Ottoman empire from this event. Osman reigned as independent monarch until 1326. He pursued his conquests against the Greeks, and established good government throughout his dominions, which at the time of his death included the valleys of Sakaria and Adranos, extending southwards to Kutaiah and northwards to the Sea of Marmora. Infirmity had compelled him towards the end of his life to depute the chief command to his younger son Orkhan, by whom in 1326 Brusa was captured after a long siege.

Orkhan, 1326–59.—Orkhan's military prowess secured for him the succession, to the exclusion of his elder brother Ala-ud-din, who became his grand vizier. At that time a number of principalities had replaced the Seljukian State. Though Yahsha Bey, grandson of Mohammed Karaman Oghlu, had declared himself the successor of the Seljukian sultans, the princes of Aidin, Sarukhan, Menteshē, Kermian, Hamid, Tekkē and Karassi decl to recognize his authority. Their example was followed by Kizil Ahmedli Emir Shems-ed-din, whose family was afterw known as the house of Isfendiar in Kastamuni. At his acces Orkhan was practically on the same footing with these, avoided weakening himself in the struggle for the Seljukian heritance, preferring at first to consolidate his forces at Br Thence he continued to win territory from the Greeks, ta Aïdos, Nicomedia, Hērēkē and, after a siege, Nicaea; Tarakli Gemlik fell to his arms, and soon the whole of the shor the Marmora up to Kartal was conquered, and the Byzant retained on the continent of Asia Minor only Ala Shehr Biga. In 1338 Orkhan achieved his first conquest from Mu hands by the capture of Karassi.

To this advance the Byzantine empire could offer no effec resistance. On the death of the emperor Andronicus III. in 1 he was succeeded by John Palaeologus, a minor; and Cant zenus, the mayor of the palace, appealed to Orkhan for assist to supplant him, giving in marriage to the Ottoman prince daughter Theodora. Orkhan lent the desired aid; his son Sulei Pasha, governor of Karassi, crossed into Europe, crushed Ca cuzenus's enemies, and penetrated as far as the Balkans, retur laden with spoil. In 1355 Suleiman crossed over from Aïdi and captured the fortress of Gallipoli, which was at once conve into a Turkish stronghold; from this base Bulaïr, Malgara, Ip and Rodosto were added to the Turkish possessions. Sulei Pasha was killed by a fall from his horse near Bulaïr in 1 the news so affected his father Orkhan as to cause his death months later. The institution of the Janissaries (*q.v.*) hol prominent place among the most remarkable events of Orkh reign, which was notable for the encouragement of learning the foundation of schools, the building of roads and other w of public utility.

Murad I., 1359-89.—Orkhan was succeeded by his son Mu After capturing Angora from a horde of Turkomans, in Murad prepared for a campaign in Europe. At that time Greek emperor's rule was confined to the shores of the Marm the Archipelago and Thrace. Salonika, Thessaly, Athens and Morea were under independent Greek princes. The Bulgari Bosnians and Serbs had at different periods invaded and quered the territories inhabited by them; the Albanians, orig natives of their land, were governed by princes of their When, on the death of Cantacuzenus, John Palaeologus rema sole occupant of the imperial throne, Murad declared war aga him and conquered the country right up to and including Adr ople, the second capital of the emperors. Three years later 1364, Philippopolis fell to Lala Shahin, the Turkish comma in Europe. These conquests produced a counter attack by allied army of Serbs, Hungarians, Walachians and Moldavi which was utterly defeated. In 1367 Murad made Adrian his capital and enriched it with various new buildings. He tinued to extend his territories in the north and west and tribute from the king of Serbia and the rulers of Kiuste Nicropolis and Silistria. Lala Shahin Pasha was appointed fe lord of the district of Philippopolis, and Timur Tash P became beylerbey of Rumelia; Monastir, Perlepē, and parts Bosnia and Herzegovina were next taken, and the king of Se consented to furnish to Murad a fixed contingent of auxil troops. In 1381 Murad's son Yilderim Bayezid married De Shah Khatun, daughter of the prince of Kermian, who brou him in dowry Kutaiah and its six dependent provinces. In same year Bey Shehr and other portions of the Hamid principa were acquired by purchase from their ruler Hussein Bey, as Karamanian princes were beginning to cast covetous eyes them; but the Karamanians were unwilling to resign their cla to be heirs of the Seljukian sultans, and not until the reign Mohammed II. were they finally suppressed. Ali Bey, the pr at this time, took advantage of Murad's absence in Europe declare war against him; but the Ottoman ruler returning crus him at the battle of Konia. Meanwhile the king of Bosnia, ac in collusion with the Karamanian prince, attacked and utt

ted Timur Tash Pasha. The princes and kings who had nted to pay tribute were by this success encouraged to and the Serb troops who had taken part in the battle of became insubordinate. Indignant at the severity with they were punished, Lazarus, king of Serbia, joined the princes. Murad thereupon returned to Europe with a large and sent Chenderēli Zadē Ali Pasha northwards; the fort- of Shumla, Pravadi, Trnovo, Nicopolis and Silistria were taken m; Sišman III., rebel king of Bulgaria, was punished and ria once more subjugated. Ali Pasha then joined his master ssovo. Here Lazarus, king of Serbia, had collected an army ,000 Serbs, Hungarians, Moldavians, Walachians and others. ug. 27, 1389, the greatest of the battles of Kossovo was t. The king of Serbia was killed and his army cut to pieces, fter the battle, while Murad was reviewing his victorious s on the field, he was assassinated by Milosh Kabilovich, who approached him on the plea of submission.

rad maintained a show of friendly relations with the emperor Palaeologus, while capturing his cities. The emperor gave f his daughters in marriage to Murad himself and the other o his sons Bayezid and Yakub Chelebi. These princes were ys of Kermian and Karassi respectively; the youngest son, Bey, governed at Brusa during his father's absence. Led by evil counsellors, Sauji Bey plotted with Andronicus, son emperor, to dethrone their respective fathers. The attempt oiled; Andronicus was blinded by his father's orders and was put to death (1387).

yezid I., 1389–1403.—After being proclaimed on the field ssovo, Bayezid's first care was to order the execution of his er Yakub Chelebi, and so to preclude any repetition of Sauji's The young prince Andronicus, who had not been completely d, sent secretly to Bayezid and offered him 30,000 ducats hrone his father John Palaeologus and make him emperor. id consented; later on John Palaeologus offered an equiva- um and, since he engaged to furnish an auxiliary force of men into the bargain, Bayezid replaced him on the throne. e aid of these auxiliaries the fort of Ala Shehr was captured), Manuel Palaeologus, son of the emperor, being allowed, mmon with many other princes, the privilege of serving in urkish army, then the best organized and disciplined force . The principalities of Aīdin, Menteshē, Sarukhan and ian were annexed to Bayezid's dominions to punish their for having joined with the Karamanian prince in rebellion. xiled princes took refuge with the Kizil Ahmedli, ruler of muni, who persuaded the Walachians to rebel against the . By a brilliant march to the Danube Bayezid subjugated ; then returning to Asia he crushed the prince of Karamania, ad made head again and had defeated Timur Tash Pasha. id now consolidated his Asiatic dominions by the capture isarieh, Sivas and Tokat from Tatar invaders, the relics of iz Khan's hordes. Sinope, Kastamuni and Samsun were ndered by the prince of Isfendiar, and the conquest of Asia r seemed assured.

the death of John Palaeologus in 1391 his son Manuel, who serving in the Turkish army, fled to Constantinople, and ed the imperial dignity. Bayezid therefore besieged Constan- le, and an army marched into Macedonia, capturing Salonika arissa (1395). The siege of the capital was interrupted by dvance of a crusading army which crossed the Danube and ed Nicopolis. While the fortress was holding out with diffi- Bayezid fell upon the besiegers and annihilated them (1396). e usual letter announcing the victory the caliph in Egypt d saluting Bayezid as the "Sultan of the lands of Rum."

er the victory of Nicopolis the siege of Constantinople was ed, and the tower of Anatoli Hissar, on the Asiatic side of osphorus, was now built. However, by sending heavy bribes yezid and his vizier, and by offering to build a mosque and slim quarter, and to allow Bayezid to be named in the weekly r, Manuel induced Bayezid to raise the siege. Between 1397 399 Bayezid overran Thessaly, while in Asia his lieutenant Tash was extending his conquests. Meanwhile Timur erlane) had started from Samarkand on his victorious career. After devastating Georgia in 1401 he marched against the Turks. Some of the dispossessed princes of Asia Minor had begged Timur to reinstate them. Bayezid replied to a request to this effect from Timur in terms which made war inevitable. An attack in force was postponed by Timur's activities in Syria and Mesopotamia. But in 1402 in a great battle near Angora the Turks were defeated, and Bayezid was taken prisoner. Eight months later he died at Ak Shehr.

This disaster checked the Turkish advance for more than a decade. Timur reached Brusa, and there laid hands on the treasure of Bayezid; one after another the cities of the Turks were seized and plundered by the Tatars. Meanwhile Timur sent letters after the fugitive sons of Bayezid promising to confer on them their father's dominions, and protesting that his attack had been due merely to the insulting tone adopted towards him by Bayezid and to the entreaties of the dispossessed princes of Asia Minor. Timur did not cross into Europe, and returned to Samarkand after capturing Smyrna (1405). For some time further, disputes between the sons of Bayezid delayed the Turkish revival. In 1413, Mohammed I., the survivor, was recognized as sultan, and in his reign of eight years recovered all his father's territories. Two years after his accession he overcame a rebellion of the prince of Karamania and recaptured his stronghold Konia (1416), and then, turning northwards, forced Mircea, voivode of Walachia, to pay tribute. The Turkish dominions in Asia Minor were extended, Amasia, Samsun and Janik being captured, and an insurrection of dervishes was quelled. In 1421 the sultan died. His services in the regeneration of the Turkish power can hardly be over-estimated. Amid the cares of State he found time for works of public utility and for the support of literature and art; he is credited with having sent the first embassy to a Christian power, after the Venetian expedition to Gallipoli in 1416, and the Ottoman navy is first heard of in his reign.

Murad II., 1421–51.—At the time of Mohammed's death his eldest son Murad was at Amasia. Shortly after his accession the emperor Manuel, having applied in vain for the renewal of the annual subsidy, paid him by the late sultan for retaining in safe custody Mustafa, an alleged son of Bayezid, released the pretender. He was defeated at last at Ulubad (Lopadion) on the Rhyndacus in Asia Minor, and Murad thereupon laid siege to Constantinople to avenge himself on the emperor. The siege was raised because the appearance of another pretender, in the person of Murad's 13-year-old brother Mustafa, under the protection of the revolted princes of Karamania and Kermian, called the sultan to Asia. Mustafa, delivered up by treachery, was hanged (1424); but Murad remained in Asia, restoring order in the provinces, while his lieutenants continued the war against the Greeks, Albanians and Walachians. By the treaty signed on Feb. 22, 1424, shortly before his death, the emperor Manuel II., in order to save the remnant of his empire, agreed to the payment of a heavy annual tribute and to surrender all the towns on the Black sea, except Selymbria and Derkos, and those on the river Strymon. Peace was also made at the same time with the despot of Servia and the voivode of Walachia, on the basis of the payment of tribute. By 1426 the princes of Kermian and Karamania had submitted on honourable terms; and Murad was soon free to continue his conquests in Europe. Of these the most conspicuous was that of Salonica. Garrisoned only by 1,500 Venetians, the city was carried by storm (March 1, 1428); the merciful precedent set by Mohammed I. was not followed, the greater part of the inhabitants being massacred or sold into slavery, and the principal churches converted into mosques.

By this time it was widely recognized that a further Turkish advance could only be prevented by the combined action of the northern peoples now definitely threatened. In 1442 a force of Slavs and Magyars under the voivode János Hunyadi (*q.v.*) drove the Turks from Hermannstadt and in the following year they were expelled from Semendria which they had conquered a few years previously. Meanwhile, again confronted by a rebellion of the prince of Karamania, Murad had crossed into Asia and reduced him to submission, granting him honourable terms, in view of the urgency of the peril in Europe. On July 12, 1444, a ten years'

peace was signed with Hungary, whereby Walachia was placed under the suzerainty of that country; and, wearied by constant warfare and affected by the death of his eldest son, Prince Ala-ud-din, Murad abdicated in favour of his young son Mohammed, and retired to Magnesia (1444). The pope urged the king of Hungary to take advantage of this favourable opportunity, and 19 days after the truce had been concluded a large army headed by Ladislaus I., king of Hungary, Hunyadi, voivode of Walachia, and Cardinal Cesarini crossed the Danube and reached Varna. In this emergency Murad was implored to return to the throne; to a second appeal he gave way, and crossing over with his Asiatic army from Anatoli Hissar he hastened to Varna and routed the allies. Murad is said to have abdicated a second time, and to have been again recalled to power owing to a revolt of the Janissaries. In 1446 Corinth, Patras and the north of the Morea were added to the Turkish dominions. The latter years of Murad's reign were troubled by the successful resistance offered to his arms in Albania by Scanderbeg. In 1448 Hunyadi, now governor of Hungary, collected the largest army yet mustered by the Hungarians against the Turks, but he was defeated on the famous field of Kossovo. In 1451 Murad died at Adrianople, being succeeded by his son Mohammed.

Mohammed II. the Conquerer, 1451–81.—After suppressing a fresh revolt of the prince of Karamania, the new sultan gave himself up entirely to the realization of the long-cherished project of the conquest of Constantinople. After completing his preparations Mohammed began the siege in 1453. Constantine Palaeologus, the last emperor, failed to obtain support from the West, the defenders of the city were vastly outnumbered by the Turks and on May 29, 1453, it was carried by assault. The sultan triumphantly entered the palace of the emperors, and the next Friday's prayer was celebrated in the church of St. Sofia (*see* ROMAN EMPIRE, LATER).

Secure in his possession of Constantinople the sultan proceeded northwards and entirely subdued the southern parts of Serbia. A siege of Belgrade was unsuccessful, owing to the timely succour afforded by Hunyadi (1456). Two years later internal dissensions in Serbia brought about the conquest of the whole country by the Turks, only Belgrade remaining in the hands of the Hungarians. Walachia was next reduced to the state of a tributary province. Venice having adopted a hostile attitude since Turkey's conquests in the Morea, greater attention was devoted to the fleet; Mytilene was captured and the entrance to the straits fortified. The conquest of Bosnia, rendered necessary by the war with Venice, was next completed, in spite of the reverses inflicted on the Turks by the Hungarian king Matthias Corvinus, the son of János Hunyadi. The Turks continued to press the Venetians by land and sea; Albania was overrun; and Venice was forced to agree to a treaty by which she ceded to Turkey Scutari and Kroïa, and consented to pay an indemnity of 100,000 ducats (Jan. 25, 1478). The Crimea was next conquered and bestowed as a tributary province on the Tatar khan Mengli Girai. Mohammed now endeavoured to strike a blow at Rhodes, the stronghold of the Knights of St. John, preparatory to carrying out his long-cherished plan of conquering Italy. A powerful naval expedition was fitted out, but failed, though a land attack on southern Italy at the same time was successful, Otranto being captured and held for a time by the Turks. In 1481 the sultan died at Gebzé. He is said to have been of a merry and even jocular disposition, to have afforded a generous patronage to learning, and, strange to say for a sultan, to have been master of six languages.

Mohammed II. was the organizer of the fabric of Ottoman administration in the form which it retained practically unchanged until the reforms of Mahmud II. and Abd-ul-Mejid. He raised the regular forces of the country to a total exceeding 100,000. Under him the independent princes of Asia Minor were finally subjugated. Many educational and benevolent foundations were endowed by him, and it is to Mohammed II. that the organization of the ulema, or legist and ecclesiastical class, is due. (X.)

MODERN HISTORY

Bayezid II. (1481–1512).—Bayezid reached the capital before his brother Jem and ascended his father's throne. To win o the followers of his brother he paid an accession present to janissaries: this became an established custom. Jem's attem to seize the throne were defeated: he took refuge with Knights of Rhodes, but they were paid to keep him in custo and after 13 years' captivity he died in Naples. He was said have been poisoned by Pope Alexander Borgia, who recei 300,000 ducats from Bayezid, but from *Taj-ut-Tevarih*, the m reliable history of the period, his illness sounds like erysipelas

Surnamed the "Saint," Bayezid was a man of peace by natu but failed to curb the warlike tendencies of the young empire. made attempts to withdraw from Otranto, and exempted Ven from her yearly tribute by imposing instead a 4% customs d on Venetian goods imported. In 1492 the armies of the Tu invaded Laibach in Carniola and Cilli in Styria. In 1494 t were driven out of Styria by the Emperor Maximilian. Wh Bayezid was fighting against his brother's claims, Moldavi attacked Turkish territory in Wallachia and he was forced to l another Turkish army into Moldavia. The khan of the Crim Mengli Girai, fought in this army, and through his influe political correspondence was opened between Russia and Turk and the first Russian ambassador, Michel Belsetchev, arrived Constantinople. Moldavia became a vassal state after two ye of war. John Albert, King of Poland, invaded Moldavia in 14 and this was followed by a counter-invasion of the Turks, but t were forced to return by the severe winter. In 1496 Hercegov was annexed to the empire, and in 1500 the Polish wars en with an armistice. Rome and the Italian States had encoura the sultan to crush the Venetian republic. On July 28, 1499, Turks gained over Venice their first great naval victory at Lepa and concluded peace on Dec. 24, 1502: a part of Morea and a islands passed to Turkey, Venice retaining Cephalonia. On Asiatic side Ismail Safevi, the shah of Persia, inspired with ligious zeal for the propagation of Shia doctrines, raided the pire (1501). The sultan attempted a pacific solution but fa to restrain his warlike son Selim from fighting the Persi Shah Ismail's propaganda rooted the Shia doctrines so firmly Anatolia that in spite of the sanguinary repressions during reign of Selim the Grim the Shia sects survive in Anatolia to day as the Kizil-Bash. Bayezid had also to fight the Egypt armies under the Mamelukes who had invaded Adana, and drove them out.

Selim then turned upon his father and, having won the ja saries to his side with promises of conquest, he forced him abdicate. Bayezid died on his way to his retreat at Dimet The political influence of the janissaries on the frequent change sultans dates from this episode. While the Ottoman empire un Bayezid, the largest Muslim State in Europe, was reaching zenith, another Muslim State, that of the Moors in Spain, declining.

Selim I. the Grim (1512–1520).—The severe disposition Selim earned him the name of the "grim." True to his promise kept the janissaries in action throughout his reign. After defeat his brother's claims, he attempted to exterminate Shi-ism not in Anatolia but in Persia which was its centre. In 1515 he a hilated Ismail Safevi's forces at Chaldran and conquered A baijan and Kurdistan. His most important conquest was Eg which he added to the empire, after overrunning Syria and def ing the Mamelukes in 1517. According to most Turkish and W ern historians he obtained from the last of the Abbasid Cali Mutuwakil, the title of Caliph. (After the fall of the Caliphs Baghdad in 1258, the descendants of the Abbasids took refug Cairo and enjoyed a purely titular authority under the protect of the Egyptian rulers.) But the important authority of *Taj-ut-Tevarih* implies that Selim did not base his Pan-Islam on the prestige of the Caliphate, for the *Fetih-Namé* (the decl tion of conquest) of Selim himself, as there quoted, has no re ence to Caliph or Caliphate. Another contemporary histor Hassan Touloun, a Mameluke and an admirer of Selim, in *History of Egypt* (*see* the ms. in British Museum) also imp that Selim meant to realize Pan-Islamism through force ra than through the assumption of the title of Caliph. He assemb

ulema in Egypt and referring to the fact that the Mamelukes
's had their sultan consecrated by the Caliph, asked whether
was necessary: the *ulema* declared that the sultanate de-
ed on force rather than on consecration. The sherif of Mecca,
-Bereket, sent his son with the holy relics and the keys of
places to Selim. But though these relics are the emblems of
aliphate it is probable that Selim wished virtually to abolish
aliphate. The later sultans, however, added the title of
h to their names.

important revolt, led by Jelal who pretended to be the
di, broke out at Yozgad in Anatolia, but was at once sup-
ed and from this date all risings in Anatolia are known as
i revolts.

im who died in 1520 never fought against the Christian
. Possessed by the ideal of uniting the Moslem East he
ed his campaigns accordingly. During his reign of eight years
mpire nearly doubled its extent. Although he uprooted cor-
on and the people enjoyed a severe but just administration,
ruelty in executing eight grand viziers is alluded to in the
ar saying: "May you be vizier to Sultan Selim." He was a
guished Turkish poet and wrote both in Persian and Turkish.
ove of culture and learning was shown by his preference for
ompany of the learned. Although among his subordinates he
hed small offences with death, his Sheikh-ul-Islam, Ali Jemali
di, who was fearless and outspoken, was able to make him
t from his plan of converting the Greeks to Islam by the
d if necessary, by reminding him of the Conqueror's (Selim's
father's) Firman, which gave religious freedom to the
ks. At one time Selim tried to make Arabic the official
age, to further his Pan-Islamic policy.

iman I. the Magnificent (1520–1566).—Soliman I., known
e "Magnificent" in the West and the "Lawgiver" in Turkey,
an only son, was saved from the wars of succession which
redecessors had to fight. He began his reign with the mag-
nous act of freeing all the prisoners of war and restoring the
s confiscated from the merchants who traded with Persia in
r's time. But this record is marred by the murder of his
although this was due to his wife's influence, the famous
em Sultana, known as Roxelana (the daughter of a Russian
:). With her began the influence of women in affairs of state,
an having committed this crime in order to leave Hurrem's
vithout a rival. She also instigated the execution of the able
d Vizier Ibrahim Pasha in order that his power might pass
ustem Pasha, her son-in-law.

liman's conquests were mostly in the West, though he had
Asiatic campaigns. The causes which provoked his inva-
were either trifling or invented for the purpose. He first
hed into Hungary in 1521 because his envoy had been
ed and because he received no congratulations on his acces-
He captured Belgrade, which remained a base throughout
urkish wars in Europe. In 1523 Rhodes and Cos were con-
d. In 1526 the Hungarians were severely defeated at the
of Mohács (*see* HUNGARY, *History*), their king, Louis II.,
, and the greater part of Hungary including Budapest taken.
Turks appointed Zápolia, the voidode of Transylvania, to be
of the Magyars. The sultan then left Hungary to put down
a rising in Tabriz. Ferdinand, the brother of Charles V., then
ed the Hungarian throne as the brother-in-law of Louis II.,
led Budapest, and drove out Zápolia, who naturally appealed
liman. In 1529 Soliman with Zápolia marched into Hungary,
d Budapest, defeated the Austrians, and Zápolia was rein-
d. Encouraged against Charles V. by Francis I. of France,
an laid siege to Vienna, but after three weeks was obliged
andon it. Part of the Turkish army went as far as Ratisbon
rmany. In 1532 Soliman again marched against Charles V.,
approached Vienna, but in 1533 a truce was signed and
gary was divided between Zápolia and Ferdinand.

uring his Persian wars Soliman retained the friendship of
inand; but in 1539 Zápolia died and Ferdinand marched on
pest. Soliman decided to uphold the claims of Zápolia's son
of his wife Isabella. He marched into Hungary, defeated
inand and placed the young king on the throne under the
regency of his mother. Soliman refused all overtures of peace and war continued both on land and sea. In 1542 an alliance between Francis I. and Soliman led to a combination of the Turkish and the French fleets against Charles V. On land, Soliman took Gran, Vizegrád, Székesfehérvár, and a part of Hungary which became a Turkish province consisting of 12 sanjaks. On June 15, 1547, a truce of five years was signed in Adrianople between Soliman, Charles V. and Ferdinand which recognized the Turkish conquests, and bound Ferdinand to pay a yearly tribute of 30,000 ducats to Turkey for the territory left to him. John Sigismund, the son of Zápolia, was recognized as the independent prince of Transylvania and of the 16 adjacent Hungarian countries, Queen Isabella to act as regent during his minority.

The terms of the treaty were soon ignored. Ferdinand being in league with Frater Gregory (*see* MARTINUZZI) to free Transylvania from the Turkish suzerainty, Soliman sent a large army under Sokolli Mohammed Pasha into Hungary. Lippa and Temesvár were taken but a victory of the Persians in the East forced Soliman to sign an armistice in 1553 and invite Austrian delegates to Constantinople to negotiate for peace. The negotiations failed and war continued with atrocities on both sides till 1561. On June 1, 1562, peace was concluded between Soliman and Ferdinand, who had been crowned emperor. Ferdinand undertook to pay all his arrears of tribute to Turkey and to continue a yearly payment of 30,000 ducats, to leave Temesvár and other towns to Soliman, to recognize the independence of John Sigismund in Transylvania and to withdraw all his Habsburg claims to interference in Hungary.

In 1564 Ferdinand died and Maximilian II. succeeded him. Maximilian attacked Tokaj which was in Turkish possession and let the tribute fall into arrears. Sokolli Mohammed Pasha, the new Turkish grand vizier, desired to wipe out the disgrace of a naval defeat in Malta which had ended in the death of Admiral Torgout, and Soliman in 1566 led an army into Hungary, although 72 years old. He died during the siege of Szigétvár, but his death was kept secret by Sokolli till the fortress fell. Thus Soliman, after ruling 46 years in life, ruled 46 days after his death, until his son Selim ascended the throne and reached Belgrade.

On the Asiatic frontier in 1526 Shah Tahmasep of Persia had taken Tabriz from the Turks while Soliman was fighting at Mohács. On Soliman's return he set out for Persia with an army, conquered the Armenian plateau and joined another Turkish army commanded by Ibrahim Pasha which had already recaptured Tabriz. The Persians retreated without fighting and in 1534 Soliman took Baghdad.

In 1535 the French Ambassador, Jean de la Forêt, negotiated a treaty between France and Turkey by which certain judicial and economic privileges were granted to France. This marks the beginning of the capitulations, which, started when Turkey was a powerful empire, were only the means of procuring an easy market for Turkish goods in France, but led to political complications and became the pretext for exploiting Turkey in her decadent days. In 1555 Soliman concluded a treaty of peace with the Persians at Amasia after conquering Georgia, the Armenian plateau and Erzerum.

Mohammed the Conqueror began the building of the Turkish navy but it was during Soliman's reign that Turkey became a first-rate sea-power. At no other time has Turkey had such a large number of famous admirals. Soliman had conceived the idea of using the renowned corsairs who raided the Spanish and Irish coasts and he had engaged Haired-din Barbarossa (*see* BARBAROSSA). He was the son of a Turkish sepahi, Yacoub, a Macedonian, and his mother was Greek, his native place being Mitylene. He presented to Turkey Algiers which he had personally conquered, and he formed what was called *Garb-Ojaklari* (the States of Barbary). This was a military organization which administered Algiers, Tunis and Tripoli. Barbarossa took Tunis but was driven out by the fleet of Charles V. who devastated Tunis and destroyed mosques and valuable libraries because the Turks had converted churches into mosques in Hungary. Barbarossa's greatest naval victory was in 1538 when he defeated the combined fleets of the emperor and the pope and of Venice under the com-

mand of Andrea Doria, off Preveza. He took Castel-Nuovo and a few islands of the Archipelago and he restored Morea to the Turkish empire. Torgout (known as Dragut in the west) was another famous corsair who had ravaged the Italian and Spanish coasts and was now engaged by Soliman. He captured Tripoli from the Knights of Malta and was appointed its governor. He died in 1565, after an unsuccessful attack on Malta. Pialé Pasha, Piri Réis, Salih Réis, Seidi Ali Réis, were other renowned admirals of this period. Piri Réis and Salih Réis conquered the coasts of Yemen and Aden as far as the Gulf of Basra. Piri Réis compiled a detailed sea-atlas (*Bahrié*) of the Aegean sea and of the Mediterranean. He also conquered Muskat and Ormuz but was finally defeated by the Portuguese and executed by the sultan in Egypt because of his defeat. Seidi Ali Réis, a distinguished mathematician, succeeded him in the command of the fleet and was also defeated by the Portuguese. He escaped to the Indian ocean with three ships on which he lived for three years; then he landed and reached Turkey by land. He wrote his travels (*Mirat-ul-Memalik*), a mathematical book on the astrolabe and a book called *Muhit* (Ocean) on the navigation of the Indian Seas.

The Ottoman State in the 16th Century.—Until the time of Soliman the Ottoman State gradually evolved from a society whose institutions were fundamentally nomadic. The power was divided between two classes: the military class representing force and the *ulema* representing religion. The *ulema* was occupied with religious questions and civil transactions based on religious principles; the judges belonged to this class, but their judgments were executed by the military. All executive power centred in the military; and the sultan himself whose autocratic person was the symbol of this power, was nominally a common soldier. The viziers, the leading administrators, were also soldiers. During war the governing body accompanied the army, this being the chief characteristic of a nomadic system. Up to the time of Mohammed the Conqueror the *medresses* (the educational institutions where the *ulema* were educated), in addition to theology taught medicine, mathematics and physics, derived from Arabic sources. During the reign of Soliman these subjects received serious attention and had special institutions devoted to them. The laws which preceded the time of Soliman and which were amended during his reign were mostly derived from the *sheria* (religious laws) or from nomadic traditions and customs. The religious and the communal affairs of the *raya* (Christian subjects) were left in the hands of their own religious bodies. The janissaries (*kapi kuli*—slaves of the palace) who comprised the most important part of the army received their military training in special barracks and received pay. The more intelligent among them were sent to a school attached to the palace called the Enderoun-i-Humayoun. They were taught the Muslim humanities (Persian and Arabic), music and practical arts and crafts.

Soliman's administration was, relatively, one of the best of his time. The Christian population in Morea preferred the Turkish rule to that of the Venetians, and some Hungarian villages chose Turkish rule of their own accord. Financially Turkey was in a good position: she had been enriched by the addition of prosperous lands, the revenue was 183,000,000 aspres, and no new tax was levied during this reign. The countries belonging to the empire were administered in two different ways. One part was ruled by the central government and consisted of 24 *vilayets* (provinces), four of which were in Europe and 20 in Asia and Africa. The second part was more or less self-governing under the suzerainty of the sultan and consisted of the kingdoms of Hungary and Transylvania, the principalities of Moldavia and Wallachia, the khanalik of Crimea and the sherifate of Hejaz. The *Garb-Ojaklari* (the States of Barbary), consisting of the provinces of Tripoli, Algiers and Tunis, had semi-independent governors who selected their own administrative bodies and later were empowered to make independent treaties. The sherifate of Mecca was ruled by the descendants of the prophet under the sultan as suzerain.

After the conquest of Constantinople and the transfer of the capital to the imperial city the Turkish system was somewhat influenced by that of the Byzantine empire. The affairs of state were discussed at the imperial Divan over which the sultan presided until the reign of Mohammed the Conqueror, after w the sultans thought it more in keeping with their imperial dig to hear the proceedings from behind a grating. The perma members of the imperial Divan consisted of seven viziers (pa with three horse-tails), the grand vizier being the chief of t and invested with supreme power by the signet of the sultan. held the title of *serdar-i-ekrem* (generalissimo) when in comm of the army, in which case one of the other viziers remained hind as *kaimmekam* (lieutenant). The viziers in the Divan called *kubbe* (cupola) viziers since they met under a cupola. following dignitaries could attend the council:—

The *kadi-askers* of Rumelia and Anatolia (the two hig judges of the empire), the *kadi* of Stamboul (the judge of stantinople), the *defderdar* (the minister of finance), the *nish* (keeper of the great seal), the *yenicheri agassi* (the chief of janissaries, who was responsible for the administration of d pline of the corps). Later the office of Sheik-ul-Islam was i tuted as the supreme authority relating to the *ulema* and the sa law. The general secretary of the Divan was called the *rei kutab* and later became the minister for foreign affairs and Cap Pasha (chief admiral of the fleet).

Each vilayet was governed by a pasha (two horse-tails) c a *beyler-beyi*. These provinces were divided into sanjaks, being governed by a pasha (one horse-tail) called a *mir-i-m* The sanjaks were divided into *kazas*, each being governed kadi and the landowners elected by the people.

The Turkish army during Soliman's reign numbered bet 200,000 and 300,000, and was one of the best disciplined and equipped of the time. The army consisted of, firstly, the j saries who were recruited from among Christian boys and prisc of war, and were trained and quartered in barracks and rece pay; and secondly, the feudal levies called *jebelu*. The janiss comprised the *jebeji* (infantry, artillery, transport), the *se* (cavalry), *azarblar* (responsible for the maintenance and repa of the warships in ports), the *bostanji* (the imperial life gu and garden guards), the *akinji* (troops numbering from 60,oc 70,000 who carried out forays in the enemy's country) and *serden kajdi* (storm troops).

The land was divided into several categories of fief:— *ziamet, timar, vakuf, yurklik-ojaklil*. The tithes (revenues these lands were apportioned to the princes, the viziers, be beyis, the defterdars as salaries. They were not hereditary. which had more than 100,000 aspres of tithes was a *khas:* from 20,000 to 100,000 a *ziamet:* one from 3,000 to 20,000 a *ti* During the war the fief-holders joined the army with the f they raised known as jebelu. The revenues of the fiefs know *vakuf* were used for the upkeep of mosques, *medresses*, sch hospitals, asylums and fountains. The *yurklik-ojaklil* were fiefs on the frontiers and their revenues were given to the fro guards and were hereditary. The grant of a fief was conditi by obligatory residence. The peasants owned the land which cultivated so long as they paid the tithes to their landlord. security of tenure of the Turkish peasant has prevented revolution centring around the land problems in Turkey.

Selim II. (1566–1574).—Selim II., after pacifying the j saries with payments, tried in vain to undermine the powe Sokolli, the grand vizier, and finally found himself obliged t the country be ruled by that great statesman, who gave the p his name. The conquest of Samos was completed and the ri in Yemen suppressed by Sinan Pasha. In 1568 the peace bet Austria and Turkey was renewed for eight years. With the of joining the rivers Don and Volga by canal so that a fleet m be sent to the Caspian sea Sokolli attacked Astrakan but fail his project. Turkish historians credit him also with the inter of opening a Suez canal. Cyprus was invaded by the Turkish a under the command of Lala Mustafa Pasha, who violated Capitulations of Famagusta (1571) by executing the Ven commander, Marco Antonio Bragadino, and aroused strong ing against the Turks. Venice, Spain and the pope united Holy League against Turkey and their combined fleets under command of Don John of Austria severely defeated the Tu fleet at Lepanto (1571). A year later the advance of a new T

fleet commanded by Kilij Ali Pasha caused Venice to break n the League and conclude a treaty with the Turks (March 573). In 1574 Sinan Pasha and Kilij Ali Pasha recaptured is and ravaged Sicily. Selim died in 1574. He was known as "sot," and passed his time in drink and debauchery. The de- nce which set in might have gone further if Sokolli had not inistered the empire.

urad III. (1574–1595).—Murad, Selim's son, opened his n by murdering his five younger brothers. He also tried to rmine Sokolli's power and in spite of his advice opened a war Persia which lasted 12 years. The Turks conquered Shirvan, s and Daghistan and peace was concluded when Abbas, the essor of Tahmasep, was firmly established as shah of Persia. olli's efforts to build an observatory in Stamboul were opposed anatical opinion; and his assassination, which soon followed, aid to have been due to the sultan. This threw the country disorder, for there was no man who had Sokolli's strength and ority to oppose the harem intrigues and corruption. The ssaries, refusing to accept a debased coinage that was called wish money" mutinied throughout the empire. This mutiny scarcely been suppressed when in 1593 the uncertain peace ween Austria and Turkey degenerated into a regular war ch is known as the "Long War." This was due to Hassan a, the governor of Bosnia, raiding the Austrian frontiers and cking Sissek. The Austrians and the Hungarians together ed the Turks in Kulpa with great slaughter. Sinan Pasha the d vizier, marched on Hungary with a large army, and war inued for 14 years. Bribery, which had become widespread in country, corrupted the army as well, and there was no office ch was not susceptible to the bribe of the highest bidder. msi Pasha, one of Murad's counsellors, openly boasted of hav- made a sultan take bribes for the first time. Véspérem and b were conquered by the Turks but the Moldavian and Wal- ian revolts checked further victories. The Sultan's Venetian e, Safié Sultana (Baffo), for many years ruled as his only wife, epted bribes and interfered in state affairs, influencing the te's relations with Venice. In later years she had rivals and freda Kadin, the chief palace woman, rose to power because he many beautiful slaves she bought the sultan and the new ns of entertainment she introduced, including dwarfs and wns. Murad had 103 children from different wives. He died 595 after a life of debauchery. The capitulations with France e renewed in 1581, those with Venice in 1589. In 1578 capitu- ons were signed with the grand duke of Tuscany for the first e and with Great Britain for the first time in 1580. The first ish Ambassador sent to Turkey was William Hairbone. Eliza- n in her letter to the sultan urges as a special claim to his ndship their common mission to fight the "idolaters," an inter- ng example of diplomacy.

Mohammed III. (1595–1603).—Safié Sultana (Baffo) who lded such a strong influence as wife continued to do so as her during this reign. The new sultan began by murdering 19 is brothers. The war in Hungary became chronic and intrigues ween Sinan Pasha and Ferhad Pasha for the position of grand er led to frequent changes of command in the army, with dis- rous results. Sinan persuaded the sultan to command the y in person, with good results at first for in 1596 the Turks aptured Erlau and in three days defeated the allied armies at resztes. Because the sultan was anxious to return to his easy in the capital and because the undue severity of Sicala Sinan ha was causing the Anatolian troops to desert, the Turks did gain much by their victory. Ibrahim Pasha, Safié Sultana's ourite, became grand vizier through her influence and she sold proxy all the high offices of State. In 1598 Raab, Totis, Ves- ém and Pappa were lost by the Turks. In 1599 overtures for ce were made by all sides without result. The unique military ievement of this campaign was that of Tiraki Hassan Pasha o in 1600 captured Kanizsa. A year later the attempt of the hduke Ferdinand to retake it at the head of 30,000 men was eated. Military mutinies and Jelali insurrections broke out in interior and Shah Abbas marched on Tabriz and Erivan, when sultan died in 1603.

FROM THE 17TH CENTURY

Ahmed I. (1603–1617).—Ahmed I. ascended the throne at the age of fourteen. The war with Persia continued fitfully during his reign. The Turks recaptured Gran in Hungary. Transylvania passed to the suzerainty of Turkey of its own accord: Stephen Bocsk, a member of its own aristocracy was appointed king. But the continual mutinies of the janissaries and the reverses in Persia forced Turkey to sign for the first time at Sisvatorok a treaty of peace on terms of equality with Austria. Austria was freed from future tribute to Turkey by paying 200,000 ducats down, and for the first time the emperor was referred to as *padishah* in the official Turkish documents. A treaty of peace was also concluded between Turkey and Persia in 1611, Persia giving to Turkey as indemnity a million pounds of silk. *Kuyuji* (pitman) Murad Pasha, so called because he threw the bodies of rebels into pits, suppressed the Jelalli risings in Anatolia. Friendly relations with Poland were restored.

Ahmed I. was of a religious disposition, and left the affairs of the state to his grand vizier. His wife, Mihri-Mah Kussem Sultana, daughter of a Bosnian priest who entered the palace at the age of 14, is one of the most dramatic figures of Turkish history. To prevent the usual murders of members of the dynasty it was decided that the eldest male of the family should succeed to the throne. Ahmed died in 1617.

Mustafa I. and Osman II. (1617–1622).—Sultan Mustafa being an imbecile was declared incompetent to rule and Osman II. ascended the throne. Sokolli's idea that friendship with Persia would be politically to the advantage of the empire was adopted by the sultan and peace was concluded with Persia. Moldavia revolted and joined the Poles and Osman marched on Khotin. The expedition was a failure and diminished the prestige of the sultan. From his contact with them he knew how utterly degenerate and useless a body the janissaries had become and decided to discipline and reform them. He pretended to go on a pilgrimage to Mecca with the intention of marching back to the capital with a loyal and well disciplined army which he hoped to raise in Syria and Arabia. When a rumour of this reached the janissaries they revolted. After marching the sultan through the streets of Istamboul and exposing him to ignominious insults they killed him.

Mustafa I. (1622–1623), Murad IV. (1623–1640), Ibrahim I. (1640–1648).—Mustafa I. was once more dragged to the throne by the janissaries but he soon abdicated in favour of his nephew Murad IV., still a minor. Till the sultan was of age the empire was in the hands of his mother, Kussem Sultana, who had to cope as well as she could with the mutinous army and the corrupt state. The army chose the grand viziers and massacred them when they wanted a change. Kussem Sultana had to open the Treasury to appease these revolts, which depleted the finances still more. When Murad IV. was of age he restored order by one of the bloodiest reigns of terror. Marching on Baghdad and Erivan he recaptured them from the Persians, repeating the atrocities which the Persians themselves had committed. He concluded a peace with Persia which fixed the Turco-Persian frontiers still in existence. On his return he murdered all his brothers with the exception of Ibrahim and continued to terrorize his officials by frequent executions. He died in 1640.

Already weak in mind Ibrahim I., his successor, was incompetent to rule. He devoted himself to pleasure and was ruled by the women in the palace while his mother Kussem Sultana once more took the reins of power. Sheker-Pare, the sultan's story-teller, enthralled the sultan with her stories and made her fortune, selling the highest positions of state. The reign of Ibrahim, which is called the "sable and ambergris period," owes its name to a story of hers. Even the high dignitaries of the empire were employed in collecting sables. It is not surprising that complete anarchy reigned throughout the empire, the capital included. A campaign against Crete, which belonged to the Venetians who had burnt some Turkish ships, began during this reign, but continued for 25 years. For the first time the Dardanelles were closed by Venetian ships, which caused a famine and led to a revolt. Ibrahim wanted to massacre the Christians, but the *ulema* were able to restrain him. The change of the residence of the ambassadors

from Stamboul to Pera dates from this event. Ibrahim was dethroned during a mutiny and killed.

Mohammed IV. (1648–1687).—Mohammed IV., the seven-year-old sultan, succeeded his father and for another eight years the affairs of state were in the hands of Kussem Sultana, his grandmother. The janissaries had supreme power, monopolizing everything, even the sale of bread. Mohammed's mother, Turhan Sultana, tried to get the power into her hands and the period of anarchy and mismanagement was prolonged by the struggle between the two women, each depending on a different military party. Turhan Sultana accused her mother-in-law of trying to poison the boy sultan and one evening she contrived that her party should invade the palace and surprise Kussem Sultana in her room. Kussem Sultana's great oratorical powers, which had enabled her to control janissary risings, failed to save her life and she was strangled with the cords of her bed curtain. Turhan Sultana now put Kuprullu Mohammed Pasha into power as grand vizier. He restored order in the army by very drastic measures, rebuilt an efficient navy, defeated the Venetians and recaptured the island of Lemnos and other islands. The improved condition of the army led to the pacification of Transylvania which was in revolt. Kuprullu Mohammed Pasha died after being in office five years and his son Kuprullu Fazil Ahmed Pasha became grand vizier. In 1663 disturbances in Transylvania caused the Turks to attack the Austrians. At first Turkish arms were victorious but the French, who had been alienated by the haughty demeanour of the Kuprullus, sent help to the Austrians under Montecuculli, the Austrian general and the Turks were defeated at the battle of St. Gotthard abbey and were forced to consent to the Treaty of Vasvár (Aug. 10, 1664), by which a truce of 20 years was agreed upon. Transylvania was evacuated but remained tributary to Turkey. The Turks retaliated on the French by depriving those Catholics who were under French protection of some of their privileges in the holy places and granting them instead to the Orthodox Church. The Cretan campaign was still in progress and the French were helping the Venetians, but the Turks took Candia and a treaty was signed in 1669 between the Venetians and the Turks which left Crete in the possession of Turkey while the fortresses of Suda, Spinalonga and Grabusa remained Venetian.

Events in the Ukraine led Turkey into war with Poland in 1672. The Turks captured Kamenetz, Lemberg and Lublin. The Poles sued for peace and a treaty was signed in 1672 at Buczacs whereby Podolia was ceded to Turkey, Ukraine left to the Cossacks, and Poland consented to pay Turkey an annual tribute of 22,000 sequins. But John Sobieski, who ascended the Polish throne, refused to abide by the terms of this treaty and war was renewed and continued till 1676 when the Treaty of Buczacs was reaffirmed, both parties abrogating the tribute clause.

Kuprullu Ahmed Pasha having died, Kara Mustafa Pasha succeeded him as grand vizier. A man of great military ambitions, he led Turkey into a series of unnecessary wars. The first was against the Russians, and, although the Turks conquered Cehrin at the beginning, their losses were so great that they signed a treaty at Radzin (Jan. 8, 1681) ceding the disputed territory to Russia. The internal disputes in Austria due to Protestant persecution caused Kara Mustafa Pasha to violate the truce signed by Ahmed Kuprullu and lead a vast army against Austria which laid siege to Vienna. The emperor and his court fled from the capital when John Sobieski of Poland saved the Austrian cause by attacking the Turks in the rear and defeating them. This kindled the crusading spirit in Europe against Turkey and an alliance between Austria, Venice, the Pope, Poland, Russia, Malta and Tuscany was formed and some of them attacked different parts of Turkey. The Austrians made conquests in Hungary, the Venetians in Greece, the Russians in Crimea and the Poles in Podolia. Turkey tried in vain to get France to join her against this general alliance. The janissaries mutinied and Mohammed IV. abdicated in favour of his son.

Soliman II. (1687–1691), Ahmed II. (1691–1695), Mustafa II. (1695–1703).—Kuprullu Fazil Mustafa Pasha was made grand vizier, and, true to the tradition of his illustrious family, he restored order in the army and in the fleet, and by wise and tolerant administration won the sympathies of the non-Muslim subje Austria captured Erlau, entered Transylvania and reached B grade and Uskub, but Kuprullu Mustafa Pasha drove out Austrians and recaptured Belgrade. He also defeated the R sians in Crimea. Mustafa Pasha went as far as to distribute se for the crops of the people of the recaptured countries. In 1 while the Turkish army was fighting in Morea Soliman II. d and was succeeded by his brother Ahmed II.

The Turks were defeated at Slankamen in Hungary un Kuprullu Mustafa Pasha who was slain on the battle-field. attack on Peterwardein was equally a failure and the Venetia captured the island of Chios. In 1695 Ahmed died and was s ceeded by his brother Mustafa II.

Chios was recaptured and the war with Austria continued un the command of the new sultan. The Turks conquered Lippa a defeated the Austrians and the Austrian field-marshal Veterani was killed. But the Russians took Azov and in 1697 Austrians under the command of Prince Eugene defeated Turks at Zenta-on-Theiss. The war was ended, on the pressure Venice, Holland and England by a series of treaties with Aust Poland and Venice concluded at Karlowitz (Jan. 1699). By terms of these treaties Turkey retained the Banat, Austria k Transylvania, Poland restored the places captured in Moldavia retained Kamenetz, Podolia and Ukraine, Venice retained Morea and Dalmatia and a two years' truce was signed with R sia. In 1700 Azov was ceded to her by a separate treaty. Dur this time Hussein Pasha, again a Kuprullu, was grand vizier, his efforts to introduce order into the country were frustrat he was driven out of office, and a fresh revolt of the janissar forced the sultan himself to abdicate. He was succeeded by brother Ahmed III.

Ahmed III. (1703–1730).—Ahmed began his reign by c ceding the demands of the janissaries and accepting their cho grand vizier. Charles XII. of Sweden, having been beaten the Russians at Poltava, took refuge in Turkey and was invi to reside at Bender. This involved Turkey in another war w Russia which had already sent troops across the frontiers in p suit of Charles XII. (1710). Baltaji Mohammed Pasha, in co mand of the Turkish army, was induced by her entreaties to gr the Empress Catherine a peace less to Russia's disadvantage t her defeat merited. Azov was left to Turkey, Russian fortres on Turkish frontiers were razed, Russia consented to the ret of Charles XII. and renounced all claims over the Tatars Crimea and in Polish territory. As the hospodars of Moldavia a Wallachia had assisted Russia during the campaign they w punished and Phanar Greek notables (*see* PHANARIOTS) gover these principalities till the Greek insurrection of 1821. Venice next to be punished for having incited the Montenegrins to rev and having invaded Bosnia and having captured Turkish ships the Mediterranean. In 1715 Turkey declared war against Veni quelled the Montenegrin revolt, captured Modon and Coron a with her fleet took the islands of Tinos and Cerigo, as well the remaining Venetian fortresses in Crete. Austria interven urging Turkey to cede to Venice certain places in Dalmatia compensation for her losses in Morea. This led to a declaration war against Austria in 1716. The Turkish army was routed n Peterwardein, and pursued by the Austrian army led by Prin Eugene, which took Belgrade and overran the Banat (1717). T Turkish army then retreated to Adrianople. By the mediation England and Holland the Treaty of Passarovitz was signed July 21, 1718: Belgrade, a part of Wallachia and Banat pass to Austria, and strongholds in Albania and Dalmatia to Veni This treaty was signed by the grand vizier Ibrahim Pasha who accused of having betrayed Turkey by accepting it, Ibrah Pasha being a man of epicurean tastes which the sultan shar The craze of the time in the capital was the cultivation of tu gardens and has given to this period of Turkish history the na of the "Tulip Period." It created a definite literary school un Nedim, the greatest Turkish lyric poet. But popular murmurin against these costly pleasures became such that the grand viz had to seize the occasion of the Persian defeat by the Afghans annex several parts of Daghistan in Persia in order to appease t

icose spirit of the janissaries. This led to a complication with ssia, but the intervention of France resulted in a treaty be- en Russia and Turkey which was signed in Constantinople ne 30, 1724). The treaty allotted Baku and Derbend on the pian coast to Russia.

The news of the defeat of the Turkish army by the Persian y under Nadir Kuli Khan led to a rising of the mob under leadership of Patrona Khalil, a bath waiter. The grand er was killed and the sultan forced to abdicate (1730). hmoud I. succeeded. This is the only Turkish rising which not originated in the army. The printing-press first came into in Turkey at this time.

Mahmoud I. (1730–1754).—Patrona Khalil was killed and his owers dispersed after the accession of Mahmoud I. The war tinued with Persia and Nadir Kuli Khan, after his successes in q and Erivan, seized the Persian throne. In 1736 a Turco- sian treaty was signed whereby all territory conquered since reign of Murad IV. was returned to Persia. Russia also re- ned the Persian territory she had annexed, thus laying the basis a Russo-Persian alliance against Turkey.

The question of the Polish succession once more led Turkey into . France had put forward as her claimant to the Polish throne nislas Leszcynski, while Austria and Russia supported the ms of Augustus III., the elector of Saxony, although Russia bound herself by the treaties of 1711 and 1720 to abstain from erfering with Poland. The Russian candidate was forced upon and, whereupon France declared war on Russia and Austria, then urged Turkey to join her. Turkey had a grievance in that ssia had refused to allow the Crimean troops to march through ghistan during the Persian campaign, so she declared war in e of the joint efforts of England and Holland. Before waiting a declaration of war a Russian army under Marshal Münnich med the isthmus of Crimea, devastated the whole peninsula, captured Azov and Kilburun, and a year later, Ochakov. The Powers of the west mediated to restore peace and the repre- tatives of the belligerents met in Niemirov in 1737 to arrange ns. But Austria put forward new claims to the principalities the Balkan peninsula which were refused by Turkey, where- n she revealed the existence of a secret alliance with Russia threatened to fight for her new claims. Accordingly her army rched on Bosnia and Wallachia, capturing Nish in Serbia. But tide of war turned against both Russia and Austria, Ochakov Kilburun being recaptured by one Turkish army while another ssed the Danube and penetrated as far as the Banat. In 1739 key consented to negotiate peace and a conference opened in camp of the grand vizier who was marching on Belgrade. The iminaries were signed under the mediation of the French am- sador Villeneuve, for whose services the Porte reaffirmed the itulations which France had already obtained. After the rance of the grand vizier into Belgrade the definitive treaties peace were concluded with Austria and Russia (Sept. 18, 1739). tria gave up Belgrade and the rest of the territory south of the e which she had gained by the Treaty of Passarovitz. The ty with Russia provided that the forts of Azov should be razed, that Russia should have no warships on the Sea of Azov or the Black Sea. The Kabardias were to remain independent as uffer-state between Turkey and Russia. Turkey consented to uss the question of recognizing the tsar's claim to the imperial e of *padishah* and admitted his right to send representatives to nstantinople.

Two years after the Treaty of Belgrade war broke out with sia because of Nadir Kuli Khan's attempt on Mesopotamia, it continued from 1743 to 1746 with varying fortunes. When ce was signed Turkey retained the frontier fixed at the time of rad IV. and Persia procured a few privileges for her pilgrims he holy places. Turkey refrained from taking part in the War Austrian Succession in spite of the efforts of France, and she ntained a peaceful attitude during the disorders which followed death of Nadir Kuli Khan in Persia. The sultan died in 1754 was succeeded by his brother Osman III. (1754–1757). The y noteworthy events of the latter's reign were the first Wahhabi ng and the issuing of the first order for veiling women's faces.

Mustafa III. (1757–1773).—Koja Raghib Pasha, the grand vizier at the accession of Mustafa III., sent an envoy to Berlin, and a treaty of friendship and commerce was signed on March 12, 1761. While he was alive Koja Raghib Pasha kept the sultan out of war. He controlled Turkey's foreign affairs while the sultan, who was of a fanatical disposition, concerned himself with the dresses and the veils of women. He projected an alliance between Turkey and France, but France and England having differences over the Indian possessions, such a treaty might have affected the English interests among the Muslims and in consequence Porter, the British ambassador in Istamboul, used his influence against it.

Before long events in Poland drew Turkey into the general war. Catherine II. of Russia tried to put her favourite, Stanislas Poniatowski, on the Polish throne on the death of Augustus III. The Poles complained to the Porte and urged Turkey to fight Russia. The sultan at first contented himself with protests, but Russia had violated the neutrality of the Kabardia, while in Serbia, Moldavia and Montenegro the Russian monks carried on seditious propaganda against Turkey. Turkey issued an ultimatum to Russia demanding that she withdraw her army from Poland. On her refusal war was declared. Turkey procured the neutrality of England, Holland and Sweden in this war, and Austria undertook to remain neutral in return for certain privileges. Nevertheless Turkey had entered the war without preparations. The Turks were first defeated by the Russian forces in Georgia, Crimea and Kabardia, and on the Dniester; the Russian Baltic fleet under Alexei Orloff reached Morea, and incited the inhabitants to revolt. The Turkish fleet was burnt near Cheshme by the Russian fleet under the command of a Scottish admiral. The Turks were defeated in Kartal by Russia, who invaded the principalities, and reduced the fortresses on the delta of the Danube and on the Dniester. In 1771 the Crimea was conquered by the Russians. Although the Austrians had undertaken to mediate and to assist the Turks, they preferred to take a share in the partition of Poland. After a fruitless conference at Focshani, the Russian representative at the Conference of Bucharest (1773) issued an ultimatum demanding the free navigation of the Black sea and the Aegean sea for Russian trading vessels and warships, the cession of Kilburun, and the right to protect the Orthodox subjects of the Sultan. Turkey refused these terms, and the war continued, the Turks fighting hard in Silistria and Varna. Mustafa died in 1773.

Abdul-Hamid I. (1773–1789).—Abdul-Hamid, his successor who had been kept in a cage for 43 years, was weak in his mind. The abuses and disorders in the army and the palace were at their worst, and the situation at home gave no hope of retrieving the external misfortunes of the state. Turkey refused the mediation of Prussia, but when the Russian army reached Shumla she was forced to negotiate peace. The Treaty of Kuchuk Kaïnarji was signed on the anniversary of the Treaty of Pruth (July 21, 1774) which had been disastrous to Russia. This was the most humiliating treaty the Turks had ever signed. The treaty was the first political manifestation of the Eastern Question (*q.v.*), and the Turkish desire for reform on Western lines dates from this disastrous event. The Tatars from Poland to the Caspian sea were given their independence, the sultan merely retaining his religious leadership as Caliph. Russia retained Kilburun, Kerch and Yenikale, while Akkerman, Ismail, Ochakov and Bessarabia were restored to Turkey. Moldavia and Wallachia became semi-independent states under Turkey, excepting for the right of Russia to intervene in the appointment and dismissal of the hospodars. The imperial title of *padishah* was definitively conceded to the Russian tsars. The Black sea and the Mediterranean were made free for commerce and navigation to both countries, and Turkey was to pay an indemnity of 15,000 purses to Russia. The most important clause from the Turkish point of view was that which gave Russia the right to protect the Orthodox subjects of Turkey. Originally this treaty only accorded to Russia the right to build a church in Constantinople and the right of making representations for the protection of the officials of this church, and Turkey undertook to protect the Christians herself. (Article 7.) This clause was later interpreted as an inclusive protection of the Orthodox

Christians, and played a disastrous part in the subsequent history of Turkey. Poland, who originally caused the war, was not mentioned, having been partitioned in 1772.

Turkey took advantage of the respite to strengthen her frontier defences and to reform the janissaries. Russia soon tried to annex Crimea, but a rupture was averted by French mediation, and also by the fact that Turkey was not ready for war. Turkey signed the Convention of Ainali-Kavak, March 10, 1770, whereby the Russian partisan Shahin Girai was recognized as the khan of Crimea, and the terms of the Treaty of Kaïnarji reaffirmed. Five years later Russia annexed Crimea and Kuban, and Turkey was forced to sign the Convention of Constantinople on Jan. 8, 1784, the stipulations as to the independence of the Tatars in the Treaties of Kaïnarji and Ainali-Kavak being abrogated. Catherine II.'s triumphant entry into the Crimea and her interview with her ally Joseph II. to discuss the partition of Turkey together with the seditious Russian propaganda in Moldavia, Wallachia and Morea created a war party in Constantinople which was sustained and encouraged by the British and Prussian ambassadors. War was declared. The Austrians joined the Russians but were driven back by the Turks from Mehadia, who overran the Banat (1789). The Russians captured Khotin and Jassy and Ochakov, all of whose inhabitants were massacred, including the women and children, by the order of General Suvorov. The news affected Abdul Hamid I. so deeply that he died.

Reform had become so urgent and inevitable that of the two young sultans who succeeded Abdul-Hamid I., one gave up his life for it and the other had to carry out his designs for Westernization by the most sanguinary measures. The ignorance, the despotism or the weakness of most of the sultans disorganised both the autonomous and the centrally governed provinces. Between the Treaty of Karlowitz and the Treaty of Kaïnarji, the absence of discipline among the janissaries and their interference in the internal policy of the state upset the administrative machinery. The partially self-governed States of Barbary (Tripoli, Tunis, Algiers) had become almost independent, keeping only a nominal connection with the empire, and choosing their own chiefs called *dayi*. The Mamelukes who were allowed to stay in Egypt by Selim the Grim had become stronger, and with the help of the janissaries were taking up a hostile attitude to the Porte. The Mamelukes in Baghdad did the same. The recurrence of the Jelalli insurrections brought forward headstrong governors who ruled the country like feudal lords. In European Turkey the locally elected notables, called *ayan*, interfered in the administration. This general disorganization was partially remedied by the grand viziers belonging to the Kuprullu family, but it continued worse than ever after them. The system of land tenure of the time of Soliman was violated. The *khas*, *timar* and *ziamet* were seized by the central government, apportioned to the favourites of the sultans or the viziers and sometimes even sold to the highest bidder and to people who were not able to rule them or take part in their defence. The number of the officials increased, and their short terms of office led to continual disorder. The officials received fees for their services, which made bribery prevalent on a large scale.

During the "long war" of the time of Murad III. the army increased disproportionately, but its individual units were no longer trained in the barracks and their military value was next to nothing. The sultans isolated themselves in their palaces, and led lives of pleasure, thus losing contact with the army. They appointed incompetent commanders, and executed them if they were defeated, which paralyzed the initiative of those with a genuine ability to command. As the supply of provisions and ammunition was also in disorder, many deserted from hunger and lack of munitions. Although the army decreased in numbers after the Treaties of Karlowitz and Passarowitz, the leaders of the janissaries would mark any man in the street as a regular soldier, register his name, and put the pay in their own pockets, while the man himself went on with his own work. All attempts so far had failed to remedy these abuses. To make matters worse, the frequent change of sultans, often brought about by the janissaries themselves, meant accession presents which at times depleted the Treasury. Then the Treasury was refilled by debasing the coina

Science and Industry which were far advanced at the time Soliman had taken no part in the progress of the 17th and 1 centuries but had remained hopelessly mediaeval. The offi class was mostly illiterate, and the *cadis* who meted out just were ignorant. The Turks refused to learn any Europ languages, and knew very little of what was going on in world. When necessity arose they used the Christians and Je as interpreters and became correspondingly dependent on the Few books on philosophy, mathematics and history were prin in Ahmed III.'s reign. Only literature, especially poetry, flouris during this decadent age, and most of the greatest Turkish po were of this time. Textile industries, being patronized by sultans, also flourished. The manufacture of implements of and ammunition continued, partly because of the artisans who herited their craft, and partly because of the experts who w brought from the West for the purpose.

Selim III. (1789–1807).—Selim III. was the only prince the last centuries who had not been caged, which gave him opportunity of greater knowledge and a more normal view of world. He was a passionate admirer of French culture, and wanted Turkey to be equal with the Western Powers in ev branch of progress. It was in Selim's mind that New Turk originated, and with him the struggle for reform and progr began seriously, at the price of so many Turkish martyrs. hoped to bring the war to a victorious end and so acquire necessary prestige for his reforms. But it was not to be. Wh the news of the Russian victory of Kalas reached Constantino he called a council, enumerated the causes of defeat and d aster, and proposed internal reform as the only remedy. He sisted that the people should elect their own *kethudas* (mayo and notables (*ayans*) without the interference of the governo that an end should be put to the unlawful tribute which the *ra* were made to pay, that the army and the administration sho be organized on a Western basis.

In the meantime one Austrian army defeated the Turks in S bia and captured Belgrade, while another in conjunction with Russian army captured Foschani. On Aug. 4, 1791, the new A trian emperor, Leopold, who was unfavourable to the Russ alliance, made a peace with Turkey at Sistova through the med tion of England, Prussia and Holland, by which Belgrade w restored to Turkey. But Russia, after defeating the Swedes, w were Turkey's allies with Prussia, was free to carry out her poli of extension in Turkey, and the war continued. It was about t time that William Pitt in England proposed the policy of prese ing the integrity of the Turkish empire. It appeared first in form of friendly advice to Russia to make peace with Turk which was rejected by Catherine II. Turkey after several rever on the field, made peace with Russia in 1792 at Jassy, the Dnies becoming the Turkish frontier in Europe.

Selim continued his reforms, especially in the army. He form a new corps, but in order to disarm the jealousy of the janissar he affiliated the new corps to them. Military schools were open the fleet reorganized, and instructors brought from Europe. B his progress was interrupted by the war with France (179 Bonaparte attacked Egypt, more indeed as a move against En land than against Turkey, as his aim was the closing of the ro to India. Turkey fought against France in Alliance with Engla and Russia. Napoleon was beaten in Syria, the French fl destroyed by Nelson at Aboukir, and the Ionian islands captur by the Turkish and Russian fleets. Peace was concluded wi France in 1802. The reactionary governors whose interests we injured by the new reforms continued to cause disorder in eve part of the empire. Pasvan Oglou, the governor of Vidin, dro the peaceful *rayas* to revolt by his persecutions, and the insu gents chose Kara George (George Petrowitz) as leader and su ceeded in taking Belgrade. An army was sent to punish Pasv Oglou, without result. The revolt of the Wahhabis in Nejd beca another source of anxiety which continued till the time of Ma moud II. A marked renewal of trouble broke out with Rus over the principalities. Constantine Ypsilanti and Alexan Murusi, hospodars of Wallachia and Moldavia, two instrume

Russia, had caused risings against the Porte which had led key to dismiss them without the consent of Russia, thus vio- g the agreement of 1802. Russia and England protested, and two were replaced. But, encouraged by the French ambassa- General Sebastiani, Turkey declared war against Russia, ough the British ambassador threatened to join Russia against key (Nov. 6, 1806). The British fleet passed the Straits, an- ed off Istamboul and delivered an ultimatum, ordering Turkey ismiss the French ambassador within 24 hours and to make e with Russia. The Porte, encouraged by Sebastiani and by ilar indignation at the presence of the ships, decided to resist. entire population of Constantinople helped to range a thou- guns along both sides of the Bosphorus in one day. The ish fleet retired considerably damaged.

the meantime the reforms and the progress of the new y were leading the janissaries and the corrupt officials to e desperate efforts in opposition, and they were supported by t of the reactionary governors. In 1807 the garrisons on the k Sea rose, under Kabakji Mustafa, and killed their officers all those who were known to be reformists. The rebellion me general and the abolition of the new troops was demanded. concessions made by the sultan in the hope of preventing her bloodshed only encouraged the rebels to make greater ands, and finally they dethroned him. General Sebastiani is ged by the Turkish historians with inciting the janissaries.

Mustafa IV. and Mahmoud II., 1808-1839.—Selim's suc- or, Mustafa, abolished all the reforms, and anarchy continued ng his reign of 14 months. In 1807, during the negotiations veen the Russian emperor Alexander and Napoleon at Tilsit the partition of Turkey, Napoleon undertook to mediate e between Russia and Turkey, if Alexander would withdraw roops from Wallachia and Moldavia. An armistice was signed ug. 1807, the Turkish army retiring to Adrianople. In the er of 1807 a committee composed of the adherents of reform Rusjuk, persuaded Alemdar Mustafa Pasha, who had dis- ished himself in the Russian war, to march on Constantinople an army of 20,000 Kirja-Ali troops, with the object of tating Selim and his reforms. Selim was killed by the janis- s before Alemdar's army could enter the palace. His nephew moud, a youth brought up in the tradition of reform, was d by Jevri Kalfa, a woman in the palace who threw ashes in eyes of the murderers and enabled the future Sultan to pe by the roof. Mustafa IV. was dethroned and Mahmoud the last survivor of his line, ascended the throne. Mahmoud appointed Mustafa Pasha grand vizier and issued a royal lamation ordering him to treat the people and their *rayas* with ce and to re-establish order. As the Russian question was not ed and the principal governors were all trying to instigate lts by declaring the reforms to be anti-religious, and thereby ing fanatical resistance, Mahmoud II. based his arguments on ious grounds and demonstrated the necessity of education reform in the name of Islam. Alemdar Mustafa Pasha d a council in Constantinople to which he invited notables influential men from all over the country. The council de- d that the new troops, under European instructors, were to e-established under the name of "Seymen-i-Jedid": that the ssary organization was to be retained but reformed, those only inally on the register and receiving pay without serving to be issed; and that the authority of the sultan was to be nanent. The new grand vizier managed to restore compara- order and began his reforms seriously, but while the Kirja-Ali ps who were loyal to him were on their Bairam leave the ssaries attacked his home at night. He pretended to parley them asking to have his womenfolk removed to a safe place, which he promised to give himself up. But when the women been removed he opened fire on the rebels from his windows fought them to the last shot, after which he blew himself up he powder-magazine under his house. The janissaries, once e masters of the situation, resumed their massacres of the new ps, and forced the sultan to cancel all the reforms.

he truce signed with Russia in 1807 had had no result, and war continued fitfully. France had encouraged the Porte to resume the Russian wars but the misfortunes of these wars aroused public opinion in Turkey against France and turned it in favour of England. On June 5, 1809, a treaty was signed in Chanak between England and Turkey, the British representative being Sir Robert Adair. A peace with Russia was also concluded on May 28, 1812, in Bucharest by the mediation of Stratford Canning, the British ambassador who played a great part in the Anglo-Turkish friendship. The treaty gave Khotin, Bender and Akkerman to Russia, and confined the Eastern frontiers of Turkey to the lines of the River Pruth. The clause which restored Serbia to Turkish suzerainty was vague and gave rise to disputes. The Turkish army marched into Serbia and appointed one Milosh Obrenovitch as the governor of his district; he however raised a successful revolt against Turkey and ruled Serbia in semi-independence. Kara George, who had returned, was killed by him and in 1817 he was designated hereditary prince of Serbia.

During the war with Persia Russia had acquired the right from Turkey to use temporarily the road from the Black sea to Tiflis by way of the valley of Rion-Phasis. Russia desired to have this district ceded to her by a secret clause in the Treaty of Bucharest, and the sultan had refused to ratify it. But within a few years she acquired the high land between the Caspian and the Black sea and the low lands along the coast between Anapa and Poti, which were nominally under the suzerainty of the sultan.

Such was the situation when a European guarantee of integrity of Turkey was proposed at the Congress of Vienna, in the belief that break-up of the Turkish empire would endanger the world's peace. It was decided, with the consent of the tsar Alexander, that England, France and Austria should trace clearly the frontiers of the Turkish empire, whose integrity the Powers would undertake to guarantee. The Porte, deeming the proposal to be a humiliating foreign intervention, refused. The return of Napoleon threw the question into the background and the Turkish empire thus remained outside the European concert. This Eastern Question (*q.v.*) which occupied the political history of the 19th century can be summed up as the result of the conflict of the following desires: Russia's and Austria's desire to reach the Mediterranean; the British desire to prevent Turkey from obstructing the route to India; the desire of the non-Muslim Turkish subjects for independence which was often concealed under the demands for reform.

Mohammed Ali Pasha, the governor of Egypt, who had become known during the war with Napoleon, had proved his strength by putting to an end the Mameluke risings; and his successful expedition against the Wahhabis in Hejaz had made him a popular hero as the saviour of the holy places. Another Ali Pasha, the *tepedelenly*, the governor of Morea, who was keeping the Greeks quiet in Morea by drastic measures but taking a rebellious attitude to the Porte, was executed.

The Greek Rising.—The Greeks found this an opportune moment to realize their ideal of national independence. Their hopes had begun at the time of Peter the Great and were considerably strengthened by the attitude of Catherine II. (*see* GREEK INDEPENDENCE, WAR OF). Their secret revolutionary society, the Hetairia, was founded in Bucharest by the Greek poet and patriot, Constantine Rhigas; and, four years after his arrest and execution in 1798, it was revived in Odessa. The society passed into action with the help of Alexander Ypsilanti, son of hospodar Ypsilanti, a Greek who had become general in the Russian army and used his forces to support the Greek insurgents in 1821. The emperor Alexander's aversion to supporting a revolutionary, even against the infidel Turks, together with the preference of the population of the Danubian principalities for the Turkish rule rather than that of the hated Phanariotes, considerably weakened the cause of the insurgents. This, the first serious rising was put down at the battle of Dragashani on June 19, 1821. But the Greek rebels in Morea had massacred almost to extermination the native Muslims and the sultan retaliated by executing the Greek patriarch in Constantinople on the charge of being instigator of the slaughter. Russia, taking this up as an insult to the Orthodox Church, broke off relations with Turkey. The European Powers used every

effort to avert a Russo-Turkish conflict. Metternich hoped that with time and the moral and material assistance of European peoples the Greeks would of themselves achieve national independence. On March 25, 1823, however, Canning induced England to recognize the Greek insurgents as a belligerent party. The Russian emperor, jealous of this new influence in favour of the Orthodox Christians of the East, called as a counterpoise a conference in St. Petersburg, in April 1824. Neither the Turks nor the Greeks would abide by its decisions and the sole outcome of the conference was an offer of the joint mediation of Austria and Russia, which the Porte refused. The sultan, finding himself unable to put down the Greek revolt, asked the aid of Mohammed Ali Pasha, the governor of Egypt, promising him the general governorships of Morea, Syria and Damascus in return. The well-disciplined Egyptian army and fleet entered the Morea under the command of Ibrahim Pasha, the son of Mohammed Ali. The Greeks were defeated in June 1827, Athens once more was in the hands of the Turks, and Ibrahim Pasha was sending crowds of Greeks as captives to Egypt and replacing them by the *fellahin* (Egyptian peasants). An isolated Russian intervention, for which Russia was concentrating in the south, was prevented by the death of the emperor Alexander in 1825. Canning persuaded the new tsar Nicholas I. to call another conference in St. Petersburg on April 4, 1826, as a result of which England was empowered to offer Turkey a settlement of the Greek question based on the establishment of Greece as a vassal and tributary State. In case of refusal the two Powers, whether separately or in common, would take the earliest opportunity of enforcing a settlement. Russia, meanwhile, issued a separate ultimatum to the Porte for the satisfaction of her other grievances. The Porte, though it resented new demands being made before the others were dealt with, was unable to resist and signed the Convention of Akkarman accepting the Russian demands which were: the confirmation of the Treaty of Bucharest; the opening of the navigation of the Black sea to Russian ships; seven years' term of office for the hospodars of Wallachia and Moldavia, as well as the consent of the Russian ambassador in Constantinople before they could be dismissed; and the recognition of the autonomy, where no Muslim was to reside except in the fortresses.

Mahmoud II., by a wholesale massacre on June 15, 1826, had crushed the janissaries, and the defence of the empire was now in the hands of the new army. The famous General Moltke was among the large number of French and Prussian instructors engaged for it. Mahmoud also abolished what remained of the feudal system in the provinces. The taxes were to be gathered by the Central Government. The execution of individuals by the viziers without trial and the confiscation of the property of wealthy persons deceased, or of persons executed by the State, was forbidden by new regulations. Mahmoud II. himself discarded the turban and adopted the fez and the European costume, and ordered all the officials to do the same. The fez remained the official headgear of the Turks till the passing of the "hat law" by the Turkish republic in 1925.

The Greek question was still unsettled. In 1826, the Greeks formally asked for the mediation of England. Canning's objection to intervening unasked having thus been removed, he invited the co-operation of Russia in making representations to the Porte which should be based on the protocol of St. Petersburg and suggested measures of coercion in case of refusal; to this the tsar consented. The coercion was to take the form of a pacific blockade of Morea, so as to force Ibrahim Pasha to evacuate the country by cutting off his supplies. Austria and Prussia, in the conference of the five Powers of the Grand Alliance in London in 1827, protested against coercion of the Porte for revolutionary purposes, and withdrew; but on the suggestion of France the protocol was made into a treaty, and as the Treaty of London was signed by the three Powers on July 6, 1827. By its public articles the Powers agreed to secure the autonomy of Greece under the suzerainty of the sultan without any breach of friendly relations with Turkey. But by additional secret articles it was agreed that in the event of the Porte not accepting the offered mediation, consuls should be established in Greece and an armistice proposed to both belligerents and enforced by the Powe

The armistice, accepted by the Greeks, was refused by Ibrah Pasha, pending instructions from Constantinople, though he c sented to keep his ships in the harbour of Navarino. In meantime the Greeks destroyed a Turkish flotilla off Salona Ibrahim, taking this as a breach of the convention, set sail fr Navarino northwards. The Russian and French fleets joined British fleet at Navarino, and on Oct. 20 attacked the Turk and Egyptian fleets and destroyed them (*see* NAVARINO, BAT OF). Turkey broke off diplomatic relations with the three Pow concerned, and the sultan issued a proclamation denouncing cruelty and perfidy of the European Powers and summoning Muslims to a holy war. Canning had died and England had g back to her policy of preserving Ottoman integrity, so the strug that followed was restricted to Russia and Turkey. Althou Turkey was in the midst of confusion due to the destruction of janissaries, and the new army was small and hardly formed, resisting power of the Turks was raised to its utmost by attitude of the Powers, and Russia had to fight two very hard a difficult campaigns before General Diebitsch could dictate ter of peace at Adrianople, Sept. 14, 1829. The Treaty of Adriano between Turkey and Russia provided that the Danubian pr cipalities were to become practically independent; that the d tricts of Anapa and Poti were to be ceded to Russia; and Greek question was to be settled according to the terms of Protocol of March 22. But in order that Russia should not enj the prestige of having emancipated Greece unaided, the oth Powers decided to give further concessions to Greece, and t was expanded into the Treaty of London of May 7, 1832, which Greece became an independent kingdom under the Bavari prince Otto (*see* GREECE: *History*).

Turkey suffered a series of serious internal revolts after t reverses had reduced her prestige. Bosnia and Albania revolt In 1830 the French occupied Algiers. Mohammed Ali Pasha, t governor of Egypt, was found to have intrigued in the rev of Albania and in Damascus. He was recalled and replied open revolt, sending his army under his son Ibrahim Pasha invade Syria. Mohammed Ali Pasha's hope was to seize t Sultanate and to start a new dynasty—a hope which seem feasible when, after capturing Damascus and Aleppo and d feating the Turkish army in Konia, Ibrahim invaded Kutah As France was supporting Egypt, Turkey endeavoured to dr England into an alliance against Egypt. Palmerston refused spite of the efforts of Stratford Canning, and Mahmoud II. desperation asked for help from Russia. The Treaty of Unk Skelessi was signed July 8, 1833, and the Russian army came the Bosporus to help the Turks against the Egyptian army, whi was now threatening to march on the capital. England and Fran suspicious of a Russian army at the gates of Constantinople, n mediated. They forced Mohammed Ali to stop the march the Egyptian army, and made the sultan accord the heredita governorships of Adana, Crete, Tripoli and Damascus to Moha med Ali, which put a temporary end to the war. The Treaty Unkiar Skelessi had included clauses which permitted Russi warships to pass through the Straits, and to land troops if nec sary, and which closed the Straits to warships of all the oth Powers, clauses which seemed to place Turkey in the power Russia. After securing peace under these humiliating conditio Mahmoud once more began to prepare his army while Mohamm Ali increased his with recruits from the provinces which had be given him. In 1839 Mahmoud sent a Turkish army against t Egyptians in Syria, but was badly beaten by the forces of Ibrah Pasha at Nezib in the north of Syria. Mahmoud died in Consta tinople while the battle was actually in progress (July 23, 183

Mahmoud II.'s reign opened seriously the period of Westerniz tion in Turkey. In addition to the army reforms already me tioned, the medical school was opened by experts from Europ and the civil service was set on foot on a modern basis. A numb of students were sent to Europe for the first time, a newspap and the first official printing press were established. The Minist of Foreign Affairs, and the Ministry of the Interior were organize as well as the Ministry of Public Works and the supreme coun

gal affairs. The naval and military schools and the school ngineering founded by Selim III. were reorganized, and in a council of public instruction was formed. The basis of ɔulsory elementary education was laid down by a royal lamation which forbade children who had had no elementary ation to take up any craft. And the Pious Foundations were ed and organized into a Ministry.

ɔdul-Mejid I. (1839–1861).—Abdul-Mejid ascended the ne at 16 when Mohammed Ali Pasha of Egypt seemed on verge of seizing Turkey and the empire seemed about to dis- into its elements. The army, the Government and the sultan helpless and the Turkish fleet was handed over to Mohammed Pasha by the treachery of Admiral Ahmed Pasha. But to ent Russia from using the Treaty of Unkiar Skelessi for her purposes the great Powers decided to intervene in the Turko- ɔtian conflict and called a conference in London. France, had supported Mohammed Ali Pasha, took no part in the settlement, but Russia for the purpose of breaking the *ite* between England and France waived her claims under the ty of Unkiar Skelessi and joined the concert. By the tocol de clôture," which was signed on July 10, 1840, the rnorship of Egypt became hereditary in Mohammed Ali's ly without undermining the sovereign rights of Turkey. The conference signed the "protocol des détroits," on July 13, , by which the sultan was to close the Straits to warships of ne Powers, and the Black sea to Russian warships.

ne schemes for reform which Selim III. and Mahmoud II. only been able partially to realize were to be more fully ed out by Abdul-Mejid I. Mustafa Reshid Pasha, the kish foreign minister and ambassador to London, returned. was the greatest statesman and Westernizer of the reform ɔd, and he personally prepared a *tanzimat* or vast plan of rms and made the sultan sign and issue it under the name of *ané-hatti-humayouni* (royal decree of Gulhané) as it was icly announced from the park of Gulhané. From this decree s the fundamental change of Turkey from the old system d on nomadic principles to that of a modern state. Like preceding decrees, in order that it might disarm fanatical ion, it also emphasized that all progress was in accordance Islam. It undertook to issue laws conforming with the age; stablish security of life, property and honour (no one was e punished without trial); to remodel every branch of the nistration; and to accord perfect equality to all Ottoman ects of whatever race or creed. This meant a great difference the Christians. Though they had religious and communal lom by the *firman* of the conqueror, the political complica- caused by the Separatist tendencies, and the massacre of Muslims in Morea by the Greeks, had aroused intense hatred made their position difficult, and even dangerous. The npt of the *tanzimat* to establish them as equal citizens helped nite them with the ruling race and before long the Christians ed all the offices in the administration, even up to the rank of net minister. Mustafa Reshid Pasha with a few convinced Westernised men around him made gigantic efforts to enforce new principles in every department.

ahmoud's military organization was extended by engaging foreign instructors and opening more military schools. The important change was the recruiting law, which reduced mili- service, which had hitherto been for an indefinite time, to a ed period. The Christians were exempted from military serv- A body of gendarmerie was instituted.

addition to the only existing educational institutions, that of *ulema* and the schools maintained by private donations, the cil of education founded and multiplied State schools, both ary and secondary, and tried to unify and centralize educa- by sending superintendents to the provinces to carry out the system. Commercial courts were opened. As the civil and l cases were sent to the Sheria courts, a school for judges ɔpened and attached to the Sheik-ul-Islam's office.

rmanent ambassadors were appointed from among the best smen and sent to European capitals; this helped to create dly relationships with the western Powers. The success of the reforms, which were carried out for the first time without resorting to terrorist methods, was forming a centralized and efficient government, which naturally aroused great sympathy for Turkey and hope for her future. The only international controversy arose when in 1848–1849 Turkey, true to her traditions, refused to give up the Polish and Hungarian refugees. She had England's support in this act. The difference with Persia over the frontier question was settled for the time being by the Treaty of Erzerum (1848), by English and Russian mediation.

The Holy Places and the Crimean War.—The possibility of a strong and reformed Turkey made Russia uneasy. Since the time of Peter the Great and Catherine II. she had considered herself the rightful heir to the declining Turkish State. The tsar, who went to London in 1844, proposed to England the partition of Turkey. England was to receive Crete and Egypt, Constantinople was to be a free city, and the Balkan States were to be autonomous under Russia. Suspicious of the Russian designs, England refused to solve the Eastern Question by so drastic a measure. But the question came up again in 1850 through a quarrel between the Catholic and Orthodox monks about the Holy Places in Palestine.

The capitulations signed on May 28, 1740, by Mahmoud I., according certain rights to the Roman Catholic (Latin) ecclesiastics in the Holy Places, had placed the French pilgrims, together with the pilgrims of the other Catholic nations, under the protection of the French flag. This stipulation of the treaty had fallen into desuetude during the French Revolution. In the meantime every advance of Russia had been marked by encroachments of the Orthodox Church on the Roman Catholic Church. The quarrels of the monks of the two churches would have passed unnoticed if Napoleon III. had not seized the opportunity to win over to his side the clericals in France and to humiliate Russia who had given to his title of emperor only an equivocal recognition. The French ambassador handed to the Porte a formal demand for the restitution to the Catholics of all their rights. The Ottoman Government proposed a mixed commission of inquiry and France agreed with the condition that no documents later than 1740 should be admitted as evidence. As this suggestion excluded the Treaty of Kaïnarji, the tsar demanded that nothing should be altered in the *status quo*. This was a contest between Russia and France for paramount influence in the East, in which England was inevitably involved, and she took the side of Turkey. The Porte arrived at a compromise in March 1852 by issuing a *firman* which accorded privileges to both sides, and she took on herself the right of "protection." Neither France nor Russia accepted this as neither desired a settlement. Napoleon III. wanted a war for dynastic reasons, and the tsar thought the moment opportune to drive out the infidel from Europe. The tsar spoke to the British ambassador in St. Petersburg about the Turkish empire as the "sick man" and renewed the proposals of partition Russia had made in 1844.

In 1853 Prince Menshikov was sent to presen. the Russian ultimatum to Constantinople. He demanded the recognition of the *status quo* and of the tsar's right under the Treaty of Kaïnarji to protect the Orthodox subjects. The Porte turned for advice to Lord Stratford de Redcliffe, the British ambassador, who was both popular and influential. He grasped the situation at once and persuaded Menshikov to present the two demands separately. On April 22, the question of the Holy Places was settled by the British, Russian and French ambassadors. Then when the question of the Russian protectorate over the Christians was raised, Menshikov found himself opposed by the ambassadors of the other Powers. Menshikov demanded that the Porte should give a note reaffirming the Russian rights, and this the Turkish cabinet seemed inclined to accept. But that cabinet fell; Mustafa Reshid Pasha came into power and, advised by Lord Stratford de Redcliffe, refused the Russian demand. Menshikov left Constantinople and on June 22, 1853, the Russian army under Prince Gorchakov attacked the Danubian principalities, explaining by a circular that this was not with the purpose of attacking Turkey but in order to obtain material guarantees for the enforcement of the existing treaties. In August a conference of the four Powers assembled in Vienna, but the settlement proposed conceded everything to Rus-

sia except the protectorate, and the Porte would not agree to it. Turkey declared war on Russia in October, and the French and English fleets passed the Dardanelles. Lord Aberdeen, hoping to keep peace, informed Russia that as long as she abstained from passing the Danube or attacking a Black sea port there would be no *casus belli*. But Russia bombarded Sinope on the Black sea coast and destroyed a Turkish squadron, and the French and English fleets entered the Black sea and demanded that the Russian fleet should retire.

The conflict at Sinope had been more like a slaughter than a battle, and the excellent behaviour and initial successes of the Turkish land forces aroused sympathy and admiration throughout Europe. The belief in the rejuvenation of Turkey seemed justified. On March 27, 1854, Great Britain and France declared war on Russia, with the strong support of public opinion; they were later joined by Sardinia. Austria occupied the Danubian principalities and by a convention with the Porte undertook to resist by arms any Russian attempt on them.

The main operations of the Crimean War (*q.v.*) were confined to the Crimea. The allied troops landed on Sept. 14, 1854, and the campaign lasted till Dec. 1855, when the threatened intervention of Austria forced Russia to accept terms which were ultimately embodied in the Treaty of Paris, March 30, 1856. Russia abandoned her pretensions to protect the Christians in Turkey, and renounced her right of exclusive interference in the Danubian principalities, to which a fragment of Bessarabia was restored; the navigation of the Danube became free under the supervision of an international commission; the Black sea was to be open to commercial ships of all countries and closed to all warships except a limited number of small warships belonging to Turkey and Russia; Turkey was admitted to the European concert and the contracting parties were to respect her independence and the integrity of her territory; the *tanzimat* was reaffirmed by a decree of the sultan cited in the Treaty. The addition of this clause prepared the way for future interference of the Powers in the internal affairs of Turkey.

The new era following the Paris Conference opened with several outbursts against the reforms. It is noteworthy that the Christians, even the clerical class, opposed it, either for fanatical reasons or at the instigation of Russia, who did not want reform to be realized in Turkey. In 1859, the Danubian principalities, encouraged by Russia, united and, choosing Col. Cusa as their ruler, formed the principality of Rumania. (*See* RUMANIA.) In 1860 a disturbance in Lebanon involving the Druses and the Christians led to a French occupation, which Fuad Pasha, seconded by Ahmed Vefik Effendi, the Turkish ambassador in Paris, contrived to restrict and to terminate as soon as possible. A *règlement* was signed in Constantinople on June 9, 1861, instituting an autonomy for Lebanon under a Christian governor to be chosen by the Powers with the consent of the Porte. This agreement lasted till the World War.

Towards the end of Abdul-Mejid's reign a secret committee was formed in Constantinople which propagated the idea of a constitutional regime for Turkey.

Abdul-Aziz (1861–1876).—Abdul-Aziz on ascending the throne on Abdul-Mejid's death in 1861 reaffirmed by decree the principles of the *tanzimat*. Pan-Slavism, which had its centre in the University of Moscow, began to penetrate Montenegro and Hercegovina which rose in revolt. These revolts were put down, but the Serbians also revolted demanding the expulsion of the Muslims who lived in the fortresses. In 1862 this revolt was pacified by ceding a few more fortresses to the Serbians, and five years later, through the mediation of England and Holland, the Turkish troops were withdrawn altogether. The Cretans, aided by Greece, revolted and declared their union with Greece. Thereupon Aali Pasha, the grand vizier, went to Crete with an army and quelled the revolt; the episode led to a diplomatic rupture with Greece and in 1869 a conference of ambassadors in Paris accorded local autonomy to Crete under Christian governors. In 1863 Ismail Pasha, the governor of Egypt, a man given to unrestrained expenditure, obtained loans from France and England, bribed a large number of influential men in the Porte, and made the sultan agree to the establishment in Egypt of a succession father to son, which he did by issuing the *firman* of May 1866, and June 8, 1867, the latter according to the governo Egypt the title of khedive. Abdul-Aziz yielded so easily bec he was desirous of bringing about the same alteration in the cession in Turkey in favour of his eldest son. The introdu of a regular budget system for the first time revealed the de able state of the Treasury. New loans, internal and external, to be raised in order to pay the interest on the old debts.

The regime of Midhat Pasha, the father of the Turkish co tution, as the governor of Nish, was so popular with all races creeds that his methods were introduced into other Roum vilayets. The people elected their provincial councils and crim and civil courts were first opened in those provinces. On M 10, 1870, a *firman* instituted the Bulgarian exarchate, thus sev the Bulgarian Church from the jurisdiction of the Greek patri of Constantinople. In 1871, Russia, taking advantage of weakened state of France, declared herself no more bound by Treaty of Paris, which had restricted the number of Rus warships on the Black Sea. An International Conference w met in London in 1871 recognized this by abrogating both restrictions on Russia and Turkey. The passage of the St remained interdicted to warships.

A law promulgated on June 18, 1867, for the first time allo foreigners to hold landed property throughout the empire exce Hejaz, on condition of their being divested of their right to protection of their own authorities concerning such prop The grand vizier, Aali Pasha, also made the first amendmen the capitulations by inducing the Powers to accept Turkish j diction over small cases for their subjects who lived at a dist from consular towns. In 1866 a Bulgarian insurrection, instig by Russia, broke out in Tirnova on the pretext that the refo promised by the *firman* quoted in the Treaty of Paris had been carried out. Although Midhat Pasha pacified the rising real motive, which was nothing less than a desire for nati independence, remained unaltered. After the death of such statesmen as Aali Pasha and Fuad Pasha, Abdul-Aziz bec despotic and began to exile people without trial. The palace penses increased and financial conditions became worse. Mahm Nedim Pasha, who was wholly under the influence of the Rus ambassador Ignatieff, declared that the Government could only a 50% annuity on her debts, whereupon Europe consid Turkey bankrupt, and she began to lose the prestige she gained after the reforms. The agrarian conflict between Muslim land-owners and the Christian peasantry in Hercego now spread to the Serbians and Bulgarians. The atrocities c mitted by the Bulgarians during this rising led the Turks to r sanguinary reprisals in 1875–1876, which turned public opi in the West against Turkey still more.

A secret revolutionary society, formed at the time of Pasha, and called "the Young Ottomans," was spreading its id and influencing public opinion. The great Turkish poet patriot, Namik Kemal Bey and Zia Pasha, another poet satirist, fled to Paris and published pamphlets inciting the pe to demand a constitutional government and succeeded in sm gling them into every part of Turkey. Midhat Pasha, who sha the opinions of the Young Ottomans, succeeded in winning c other members of the cabinet for constitutional change, and tained a *fetva* for the deposition of Abdul-Aziz, who was acc ingly dethroned in 1876 with the purpose of establishing a con tutional regime. A few days after his deposition he commit suicide. His brother, Murad V., who ascended the throne, bec insane after reigning three months and was deposed.

Abdul-Hamid II. (1876–1908).—At Abdul-Hamid's access a constitution derived from the French system and prepared Midhat Pasha, the grand vizier, was proclaimed by a decree Dec. 23, 1876. Six weeks later Midhat Pasha was dismissed fr office and forced to leave Turkey. Almost at the same momen conference of the delegates of the great Powers gathered to c cuss the Bosnian, Serbian and Bulgarian questions in Consta nople. Its final proposals were that an international commissio investigation should be formed and that a governor gene

:ted by the sultan, and approved by the Powers, should be ap- nted over the provinces in question. This proposition was re- ted by the Porte and Russia declared war on April 24, 1877. e Rumanians joined Russia and Austria declared her neutrality. olic opinion in Europe was anti-Turkish, especially in England, ause of the sanguinary repression of the Bulgarian revolt, and a single voice was raised in favour of Turkey, especially en the new Turkish parliament which was to carry out the re- ms incessantly promised by previous sultans was swiftly dis- sed. The Turks were defeated both in Europe and in Anatolia, l the Russian army reached Adrianople where both a truce and preliminaries of peace were signed on Jan. 31, 1878. The pre- inaries of peace signed in Adrianople were incorporated in the ce treaty, which was concluded in San Stefano on March 5, 8. Rumania and Serbia were to become independent, while lgaria was to become a vast principality, its frontiers reaching h to the Mediterranean and the Black Sea. The provinces of rs, Ardahan and Beyazid were to be given to Russia as a war in- nnity. England objected to the treaty as violating the terms of international treaty signed in Paris, and proposed a new con- ss. At first only Germany, France and Italy were represented, when Austria, who was in a position to endanger the retreat the Russian army, came in, Russia was obliged to do likewise. rkey contracted a defensive alliance with England at the price giving her the island of Cyprus on July 4, 1878.

On July 13, 1878, the Congress of Berlin ended the Russo- rkish conflict. It modified the Treaty of San Stefano; recog- ed the independence of Rumania, Serbia and Montenegro; re- ed the frontiers given by the Treaty of San Stefano to Bul- ia, and further divided the territory into two parts, one of ich became a self-governing Turkish province named Eastern melia. Turkey had the sanjak of Beyazid in Anatolia restored her but she was to pay an indemnity of 300,000,000 roubles to ssia. The most important clause of the treaty was the formal gagement of Turkey to introduce reforms in the Rumelian prov- es as well as in the eastern provinces which had Armenian norities. Abdul-Hamid who immediately after the Congress en- ed a number of European experts on the pretext of reorganisa- n and reform, before long dismissed them; he also dissolved liament with the remark that Turkey was unfitted for parlia- ntary government. Apart from the occupation of Egypt by gland (1881) which is dealt with elsewhere (*see* EGYPT), the ef interest of Turkish history now lies in the steps by which dul-Hamid secured his predominance. The power of the Porte s slowly transferred to the palace through the machinations of d Pasha, the first secretary of Abdul-Hamid, who before long s an absolute monarch. Midhat Pasha, the veteran reformer, s lured back by a free pardon and appointed governor of yrna. Soon after, on the pretence that the suicide of Abdul- z was really a murder committed by Midhat Pasha, a sham trial s opened in the palace, and, on the evidence of false witnesses cured by Abdul-Hamid, Midhat Pasha was condemned to th. Abdul-Hamid changed the death sentence to exile and prison Taif, near Mecca, but a few years later he had Midhat Pasha ngled in prison. Midhat was the last grand vizier strangled the orders of the sultan in Turkish history. At the same time, the finances had become worse after the war, and the payment debts was falling into arrears, Said Pasha, now grand vizier, nded the Ottoman Public Debt administration which gave the trol of the payment of debts to European delegates. (Decree of harrem, Dec. 1881.)

In 1885 a rising took place in the province of Eastern Rumelia, ich was united to Bulgaria. Turkey appointed Prince Alexander Battenberg (the prince of Bulgaria) governor of Eastern melia, a diplomatic way of accepting the annexation. Revolts Crete had been in progress since 1890, and Greece hoped to ex the island. The series of independent non-Muslim govern- nts which had been founded in succession within the empire ed the hopes of all the other national minorities. The Ar- nians in the eastern *vilayets*, who enjoyed freedom of education their schools, succeeded in permeating all the Armenian com- nities with the desire for national independence. Two revolu- tionary Armenian committees, called Hinchak and Dashnak- sutioun, who were in close touch with European centres, were formed. Abdul-Hamid's foolish patronage of the Kurdish com- munities encouraged them to persecute the Armenians. This, as well as the severity with which the taxes were collected, gave the Armenians two pretexts to rise in revolt in 1894. These revolts were repressed with such sanguinary measures that England and France prepared a programme of reforms for the eastern *vilayets* and forced Turkey to accept it. No effect was given to the Turkish promises and in 1896, when Lord Salisbury tried to enforce re- form on those *vilayets*, the other powers would not agree to the coercion of Turkey. The Armenian revolutionaries in despair adopted a form of revolt which would force the attention of European political circles. They revolted in Constantinople and attacked the Ottoman Bank, a European institution. The repres- sion was once more sanguinary. In 1904 the Armenian revolution- ary committee made a vain attempt on Abdul-Hamid's life and won the sympathy of the "Young Turks."

On the ground that Greece had inspired the revolts in Crete the Porte declared war on April 17, 1897, and the Turkish Army, after inflicting a severe defeat on the Greeks, marched on Domekos. The Powers, becoming anxious, intervened and ended the war. A peace was concluded which involved a slight rectification of the frontier and the payment of an indemnity of four million Turkish pounds by Greece. Crete was put under international control, "en depot," and much of the capitulations which benefited Greek citi- zens was cancelled. In 1898 Prince George, the son of the king of Greece, was appointed governor of Crete and a national assembly called. The refusal of Austria and Germany to take part in the anti-Turkish settlement of the Cretan question, marks the begin- ning of Germany's "Drang nach Osten" policy. As a result of her apparent pro-Turkish policy she obtained a concession to construct the Anatolian railway and in 1899 the Baghdad line. Abdul- Hamid's preference for Germany was due partly to the friendly attitude of the German kaiser and partly to the fact that he feared the liberal influence which France and England would have over the intellectuals in Turkey.

During the latter part of Abdul-Hamid's reign the Macedonian question became most important. The independent Balkan States carried on anti-Turkish propaganda among their own races in the Turkish Balkans and it is through this movement that the "comit- ajis" appeared in the Balkans. Comitajis were armed bands of political partizans, who have ever since devastated the Balkan peninsula. Their activities caused risings and slaughter, which were avenged by equal if not greater ferocity, which added to Turkish ill-repute in Europe. In 1903 after the Bulgarian insurrection in Macedonia, Turkey accepted the Marszteg programme, which was prepared by Austria and Russia. According to this programme the three *vilayets* of Salonika, Monastir and Uskŭb were placed under a Turkish inspector-general (Hussein Hilmi Pasha) who in turn was under the supervision of Russian and Austrian civil agents. The gendarmerie was given a foreign commander, and French, English and Italian instructors.

In spite of these reforms Macedonia could not be pacified and the work of the Comitajis went on. The agreement of King Edward VII. of England and Tsar Nicholas II. at Reval in 1907 was widely rumoured to be a new plan for the partition of Turkey. The Turkish officers in Macedonia, partly affected by this rumour, made an attempt to settle this vexed question once for all. They joined a secret society, called the "Committee of Union and Progress" which was formed to restore the constitution.

The "Young Turks."—These "Young Turks" were the succes- sors of the Young Ottomans, who after the closing of the first parliament had worked in secret for the restoration of the consti- tution by means of publications and secret societies both in Europe and in Turkey, mostly among the students in the military and medical schools. From 1882 onwards Abdul-Hamid had put the press under a strict censorship and by an elaborate network of spies had abolished freedom of speech. The obscurantist educa- tional system was preventing the spread of modern ideals, the Christian schools alone not being affected by this system. Under these conditions Talaat Bey, a chief clerk of the Salonika post

office and a student of law, and Rahmi Bey, a local notable, together with a few others, had formed "the Secret Society of Union and Progress" on the model of the Freemason lodges. The Turkish revolutionary societies in Europe were affiliated to the Salonika society through their leader Dr. Nazim. When the intellectuals and officers of Macedonia such as Niazi, Enver, Mustafa Kemal and Jemal Bey joined the committee, the organization had an active force at its command in the Macedonian army. Captain Niazi first led an armed rising in Resna and the other conspirators followed in Monastir. The revolt shot though the cities of the empire, and Abdul-Hamid was informed on July 23, 1908, that he had no alternative but to restore the Constitution. This bloodless revolution aroused enthusiasm even among the Serbian, Bulgarian and Greek Comitajis, and among the Armenian revolutionaries. Representatives of nearly all these came to Salonika and joined the Union and Progress, which ceased to be secret after the proclamation of the Constitution. It seemed for the minute as though all the different racial elements of the empire would really unite in a constitutional Turkey. But the separatist and nationalist ideals of the different races were too deeply rooted to be swept away by momentary enthusiasms. The restoration of the constitutional regime postponed indeed the Reval Programme. But both Austria, who thought Turkey an obstacle to her expansion towards the Aegean sea, and Russia, who found a strong Turkey a hindrance to her plans of expansion, felt uneasy. On Sept. 15, 1908, the Russian and Austrian foreign ministers met at Buchlau and agreed on a partition programme by which the Straits were to be in the Russian zone and Bulgaria a Russian sphere of influence; Macedonia was to be in an Austrian zone, and Serbia an Austrian sphere of influence; Albania was to be in an Italian zone and Greece an Italian sphere of influence. Fifteen days after this meeting Austria annexed Hercegovina (Oct. 5, 1908), and Bulgaria declared her complete independence. Turkey recognized the Bosnia-Hercegovina annexation, for which Austria paid £2,200,000 and evacuated the sanjak of Novi Bazar. For Turkey's recognition of Bulgarian independence Russia cancelled £20,000,000 of the Turkish indemnity. Before long these foreign blows were followed by the recrudescence of internal conflicts. The Albanians revolted against the new regime in Macedonia, and the Kurds attacked the Turks, the Armenians and the Nestorians in eastern Anatolia. In Adana the reactionaries attacked the Armenians, and Yemen rose in revolt. Izzet Pasha was sent to Yemen to pacify the region, which he was able to do by a friendly agreement with the Imam Yahia, 1912. The reactionary opposition in the capital incited fanatical opinion against the new regime, and was greatly aided by two political murders in Constantinople committed by adherents of the new regime. Finally the movement passed into a military revolt on April 13, 1909. A great number of officers and adherents of the new regime were massacred, parliament was raided and several deputies murdered. Abdul-Hamid pardoned the leaders of the revolt and formed a new cabinet. In reply an army under Mahmoud Shevket Pasha, sent by the Young Turks from Salonika, marched on the capital and punished the insurgents. Although there was and is no documentary evidence of Abdul-Hamid's part in the reactionary rising, his evident desire to restore absolutism led parliament to procure his dethronement by a *fetva* and Mohammed V. took his place.

Abdul-Hamid had tried to revive the political influence of the Caliphate in the hope of retaining the non-Turkish Muslim elements of the empire. This Pan-Islamic ideal of Abdul-Hamid was favoured by Kaiser Wilhelm II. who, during his visit to Jerusalem, spoke of himself as the friend of the "Caliph of three hundred million Muslims." Abdul-Hamid constructed the Hejaz railway to further the same ideal.

The Constitutional Regime.—Now that the Government of the Young Turks was firmly established the Committee of Union and Progress became a political party and efforts were made to stop the interference of the army in internal politics. In spite of the great losses of territory the empire over which the Young Turkish Party was to rule extended from the Adriatic to the Indian ocean, and from the Caucasus to Tunis. Thirty-three years of mismanagement under the despotic reign of Abdul-Hamid had reduced Turkey to such a state that in any case a new governme had a difficult task; and although the Young Turks were full patriotic zeal and well-versed in Western culture, they had had experience in governing. The army was put under intensive Ge man instruction, the navy was put under instructors led by A miral Sir Douglas Gambles. A French expert, Charles Laure was engaged for the financial department, though it was Djav Bey, the minister of finance, who first succeeded in establishing finance department on European lines. A great change took pla in public works through the concessions given to European co panies, which brought foreign capital into the country. In eve branch a serious and fruitful activity began.

The evacuation of Crete in 1909 by the four controlling Powe led to an acute difference between Turkey and Greece. In 19 the Cretans elected deputies to the Greek parliament in Athe but Venizelos, the Greek premier, refused to admit them, an a which prevented war.

The Italian and Balkan Wars.—Italy, having been assure of the neutrality of the Powers, gave the Porte an ultimatum 24 hours on Sept. 28, 1911, and occupied Tripoli, Cyrenaica a the Dodecanese islands, and then bombarded Prevaza, without a provocation. Without a strong navy Turkey was unable to defe Tripoli, but Enver and Fethi Beys organized a defence by t natives, who were thoroughly roused, and the invaders were co fined to the coast till the Balkan War forced Turkey to make pea at Ouchy on Oct. 15, 1912. Tripoli and Cyrenaica were left Italy, but the sultan was permitted to send a representative, call "naib-u-sultan." The fate of the Dodecanese islands was not d cided till the Lausanne conference. A little time before the Treat of Ouchy, a faction in the army, opposed to the Union and Pro ress Party, had brought about a change of Government, and t cabinet formed was composed mostly of the members of the o regime, including Kiamil Pasha, the well known Hamidian gra vizier. Russia offered to help Turkey in case of an attack on t Dardanelles on the condition that the Russian fleet was allowe to pass the Straits. The Porte refused.

To stamp out the comitajis Turkey had embarked on a attempt to disarm the people in the Balkans. Greece, Serbi Montenegro and Bulgaria in reply reconciled their conflicting in terests in the Balkans, and formed an alliance against Turke (March–Oct. 1912). Turkey was unaware of this alliance for long time, but on Oct. 8, 1912, Montenegro declared war o Turkey; and on Oct. 14, Greece, Serbia and Bulgaria first issue ultimatums demanding reforms and the demobilization of t Turkish army in the Balkans, and then declared war. The politic dissensions which affected the command and the organization o the army proved disastrous to Turkey, and the Turkish army wa defeated, though it made a fine and prolonged defence of Scuta (in Albania), Yanina and Adrianople. Adrianople was still in t hands of the Turks when the advance of the Bulgarian army wa stopped at the last defences of Constantinople, the Chatalja line The Turkish cruiser "Hamidie," under the command of Rauf Be escaped through the lines of the Greek fleet at the Straits, an wandered in the Adriatic, Aegean and Mediterranean, bombardin enemy ports, hampering their transports and raising the Turkis morale. At the beginning of the war the Powers had declared tha whatever the military results of the war might be the territoria *status quo* would be maintained in the Balkans. Turkey hope that this declaration would apply as much in the event of Turkis defeat as of Turkish victory. Kiamil Pasha, known for his pro English views, was made grand vizier. He accepted the post con fident of English support during the negotiations, and relying o the assurances which Sir Gerald Lowther (the British ambassador had given to his son. The Powers called a conference in Londo after the Turkish defeat. But since Kiamil Pasha's acceptance o office did not alter the situation, and as the *status quo* was clearl going to be changed in favour of the Balkan States, contrary t the declaration of the Powers, and since Kiamil Pasha's Govern ment was about to cede Adrianople even before that city ha fallen, the Young Turks determined to seize power again. The raided the Sublime Porte and forced Kiamil Pasha to resign. A Young Turkish cabinet was formed under Mahmoud Shevke

a. Although at first the new cabinet refused the terms of e of the London conference, the intervention of Russia and ria and the fall of Adrianople enforced their acceptance. This ght the Turkish frontiers in Europe to the line Midia–Enos. eanwhile Greece and Bulgaria, on the question of territory, ared war on each other, and this caused the Second Balkan . The Rumanians, with the purpose of annexing the Dobruja, marched on Bulgaria. This moment was seized as opportune he Turkish army to march on Adrianople, and on Sept. 29, , it was recaptured. A treaty of peace was signed with Bul- in Constantinople by which Adrianople passed to Turkey. November 13, 1913, peace was concluded with Greece by h she was given Crete and the rest of the Aegean islands, ex- Tenedos and Imbros and the Dodecanese islands, which lat- were under Italian occupation. On March 14, 1914, peace was ed with Serbia. The net result of the series of treaties con- ted with the Balkan States, was the loss to Turkey of all her essions to the west of the Maritza river.

Mahmoud Shevket Pasha's cabinet then attempted a general ement of all the differences with England and France. Hakki a, ex-grand vizier, was sent to London to come to an under- ding over the Persian gulf controversy, and to negotiate for modification of the financial capitulations; Djavid Bey, the inister of finance, was sent to France to settle the railway stions, to modify the financial capitulations, and to raise a . But during these negotiations the opposition (the *Entente rale*) murdered Mahmoud Shevket Pasha and the Young ks passed repressive measures against the opposition. A new net was formed under Said Halim Pasha. A military mission brought from Germany under General Liman von Sanders, was also appointed commander of the army corps in Con- tinople. The navy was under Admiral Limpus. A detailed gramme of reform for the eastern vilayets was prepared. As Powers refused to provide experts, inspectors were engaged n Sweden; the Ministry of the Interior, however, employed ish inspectors.

he policy of the Young Turks had begun by being a policy 'Ottomanism," which aimed at uniting all the racial and re- ous elements of the empire. The risings in Macedonia had ved that the nationalism of each element, encouraged by out- Powers, could not be assimilated by such a weak State as Tur- Turkey through the Balkan War lost her Albanian, Bulgarian, ian and most of her Greek subjects, and the Arabs, incited by nce, also manifested separatist tendencies, although to give the t to use Arabic officially in the courts in Arabia was the only entralizing measure the Young Turks had taken. The failure Ottomanism was followed by the revival of Abdul-Hamid's -Islamist policy, a decision encouraged by the sympathy ch the Indian and the Egyptian Muslims had shown during disasters of the Italian and Balkan Wars. It was this Pan- mism which later led the Young Turks to proclaim *jihad* ly war) in the hope of influencing the Muslim combatants in Allied Armies, during the World War. This revival was led Enver Pasha, opposed by a larger group which adhered to pure onalism, led by Keuk-Alp Zia, the poet and philosopher, who helping the cultural-nationalist institutions called the "Turk ds," and the "Turk Ojaks" (opened 1912). The influence of kish refugees from Russia caused the nationalism of the Union Progress Party to take a Pan-Turanist form.

he disagreement between England and Germany over the Bagh- railway and that between France and Germany over their ective railway spheres, were settled by two agreements signed ectively in June between England and Germany and in Feb. 4, between France and Germany.

The World War.—In 1913 Enver Pasha, formerly Enver Bey, ame minister of war. His policy was to give the high com- nds in the army to younger men; the military organization con- ed to be under the German mission. There were secret nego- ions between Germany and Turkey known only to the grand er, Talaat Bey and to Enver Pasha. A secret alliance was ed on August 2, 1914, when war was breaking out between many and Austria on one side, and England, France and Rus- sia on the other. Turkey declared her neutrality but mobilised at the same time. There were war and anti-war factions in the Party. The anti-war faction tried to come to an understanding with the Allies, declaring that Turkey would remain neutral if the financial capitulations were modified and a loan granted. Djavid Bey, the minister of finance, was at the head of the anti-war fac- tion. The Allies made no promises, but they demanded the dis- missal of the German commanders and the expulsion of the crews of two German warships which had taken refuge in the Darda- nelles. The British Government commandeered the two Turkish dreadnoughts which were then being constructed in England with the money raised by popular subscription, an act which caused general surprise and disappointment. And when Germany offered the dreadnoughts "Breslau" and "Goeben" to the Turkish navy the anti-war faction was weakened. The war faction argued that Turkey had lost by her political isolation since the Crimean War, that she should join Germany who was fighting against the hereditary enemy of Turkey, tsarist Russia, and that should she become victorious, she might become free from the capitulations and even regain some of her lost territories. On Sept. 8, 1914, Turkey de- clared the capitulations abolished, which raised protests from all the Powers, including her ally, Germany. When the two German warships, which had become units of the Turkish navy though still under German command, attacked Russian ships and ports in the Black sea, Russia declared war, and England and France did the same. Turkey thus found herself at war with the Allies on the Egyptian, Mesopotamian and Caucasian frontiers as well as at the Dardanelles (*see* MESOPOTAMIA, OPERATIONS IN; PALES- TINE, OPERATIONS IN; and DARDANELLES CAMPAIGN). The Dar- danelles were successfully defended by Turkey, but the Russians took Trebizond, Erzerum and Erzinjan and marched towards Sivas; while Turkey failed in her attack on the Suez canal. As Turkey had mobilised to her utmost limit it became almost impos- sible to sustain the army; the civil population suffered privation hitherto unknown; martial law was proclaimed everywhere. The Communist Revolution led Turkey and her Allies to conclude a Peace Treaty with Bolshevik Russia at Brest-Litovsk, March 3, 1918, by which all her lost territory was restored to her; even those districts which she had ceded to Russia in 1877. But the Arab nationalists, supported by England, drove out the Turks from Hejaz, except from Medina. The British army occupied Syria. On Oct. 30, 1918, an armistice was signed at Mudros, on the British warship "Agamemnon," between Admiral Calthorpe and Rauf Bey, the Turkish minister of marine. Although the armistice aimed at ending the World War, it did not end yet for Turkey; she had to fight for four years more actually against Greece though virtually against the Allies themselves. In 1917 Mohammed V. had died and his brother Mohammed VI., known as Vahideddine, had ascended the throne. During the war secu- larization in education and other departments had taken place. The university had been extended and its principal chairs were occupied by German professors. The Sheria courts were taken from the Sheik-ul-Islam and given to the Ministry of Justice. A "family law" issued in 1916, reformed marriage and divorce regu- lations. Women, who already had equal education with men, now filled public posts, and the university opened its doors to them.

During the Turco-Russian battles on the Caucasian Front, the Armenians created disturbances behind the Turkish lines and threatened to cut the lines of communications. The Turkish gov- ernment began a general deportation in which atrocities were com- mitted on a large scale. When General Antranik, the Russo- Armenian general, entered eastern Anatolia, the Armenian soldiers under his command, the so-called "Christian Army of Revenge," replied by similar atrocities.

The Armistice and the Nationalist Movement.—The Turks welcomed the armistice as being the end to the great suffer- ing of long years. But they soon forgot this suffering in the humiliation and persecution to which the armistice exposed them. The Allied fleets and armies occupied the Straits, Constantinople and even places outside the armistice line, and the terms of the armistice were stretched to the point of violation. Under these conditions, the Turks had a bitter foretaste of the peace they

would receive at the hands of the Allies. Both in Stamboul and in the provinces, officers and intellectuals met in secret and began to discuss how to secure a tolerable peace, and as the nationalists appeared in the forefront of the general reaction against the Allies, this agitation received the general name of the "nationalist movement." Meanwhile the Allies could not come to an agreement among themselves over the Turkish Peace. Finally, the Greek army was landed in Smyrna under the protection of the British, French and American fleets, and the Greeks inaugurated their occupation by massacres committed in full view of the Allied fleets, on May 15, 1919. (Italy, having retired from the peace conference for the moment, did not take part. By the inter-allied agreement of St. Jean de Maurienne in 1917, Smyrna and Adalia had been apportioned to Italy, and she had landed troops in Adalia April 1918.) The Greek massacres in Smyrna aroused general indignation in Turkey which ended in the national determination to resist to the last, even if this meant total disintegration. Mass meetings in Constantinople were the first manifestation of this feeling.

But meanwhile Turkey was in a state of anarchy. The responsible leaders of the Union and Progress Party had escaped to Germany, and the Party was dissolved. Mohammed VI., a personal enemy of the Young Turks, forced Izzet Pasha's cabinet, which to some extent was able to keep order, to resign; and the *Entente Liberale* came into power. Certain nationalist leaders wanted to save the country from disintegration by co-operating with the sultan, and using his prestige as sultan-caliph. Among these was Mustafa Kemal Pasha. But Mohammed VI. preferred to sacrifice the existence of his nation to his personal security, and this he did by bringing Damad Ferid Pasha into power, and through him giving the reins of the Government to the high commissioners of the Allies. In western Anatolia organizations for a national defence against the Greek invasion were rapidly arising. In eastern Anatolia, especially in Trebizond and Erzerum, associations, under the guidance of Kiazim Kara Bekir Pasha, were preparing to oppose any attempt of the Allies to create an Armenia out of the territories which, even before the deportations and atrocities, they claimed had been predominantly Turkish. The sultan with the allied assent, in order to control these organizations and disperse them if necessary, sent Mustafa Kemal Pasha to eastern Anatolia as the military inspector general. But as he was already in correspondence with these organizations, he met Rauf Bey, Ali Fuad Pasha and Colonel Refet at Amasia on his way to Erzerum, and signed the Amasia protocol on June 19, 1919; Kiazim Kara Bekir Pasha also signed by telegram. This protocol is the first document that formally declared the national determination to resist both the Allies and also the sultan, as the instrument of the Allies. A national congress assembled in Erzerum, on July 23, 1919, and Mustafa Kemal Pasha, having resigned from the army, presided. Another congress assembled in Sivas on Sept. 4, 1919, to which the national associations of Western Anatolia sent representatives. This congress reaffirmed the decisions of the Erzerum congress, added plans for the defence of eastern Thrace, and chose a representative body to control the movement in Anatolia. No president was chosen, but Mustafa Kemal Pasha's leadership was generally recognized. This manifestation of the national will forced the sultan to dismiss Damad Ferid Pasha. A new cabinet with nationalist tendencies came into power. In Jan. 1920 a new parliament assembled in Constantinople composed of a Nationalist majority. The parliament issued the national pact as accepted by the two congresses.

This "national pact" formulated the demands which the nationalists made during the whole struggle, and which they obtained eventually at Lausanne. It proposed self-determination for the Arab provinces south of the armistice line; it agreed to the opening of the Straits to commerce; it proposed to grant to non-Turkish minorities the same rights as they had secured in Europe under various post-war treaties. The pact also demanded, either explicitly or implicitly, that Turkey should retain all territories inhabited by non-Arab Ottoman Muslim majorities, which meant not only Anatolia but eastern Thrace and the Mosul vilayet; that Constantinople should be given military security; that the capitulations should be abolished; and that there should be a reasonable settlement of the public debts.

The Allies were watching with some anxiety the nationalist activities which consisted mostly of smuggling in arms and ammunition and organizing the defence. Mustafa Kemal Pasha stayed in Anatolia to conduct these activities. The Allies, in conjunction with the sultan and the *entente liberale* Party, decided to strike at the Nationalist movement through the persons of the leading deputies and intelligenzia in Constantinople. On March 16, 1920, the Allied forces in the capital seized a large number of nationalists, including Rauf Bey, the leader of the Nationalist Party in parliament, and Kara Vasif Bey, the head of the nationalist organization in Constantinople, arresting them in the parliament house itself. Parliament was then closed by the orders of the sultan. Some deputies and a few of the intelligenzia escaped to Angora, which had become the Nationalist centre.

The Great National Assembly.—Mustafa Kemal Pasha issued a proclamation inviting Anatolia to elect its deputies for the new assembly which might become a constituent body. The assembly was opened in Angora and on April 23, 1920, Mustafa Kemal Pasha was elected president both of the assembly and of the Government. Thus came into existence a new Turkish Government over all territories not under foreign occupation. A new constitution proclaimed the sovereignty to belong to the nation without restriction, and the Great National Assembly to be the sole and lawful representative of the nation, and to exercise sovereignty in the name of the nation. But Mustafa Kemal Pasha tried to make use of those who were still loyal to the sultan by declaring in his speeches that the sultan-caliph was a prisoner in the hands of the Allies, and that he would be restored after the realization of the national ideal. The Government of Constantinople, controlled by the Allies, condemned the leading nationalists to death by extraordinary courts, and issued a *fetva* denouncing them as outlaws. The Anatolian Government retaliated by issuing corresponding *fetvas*. The Sultan's Government sent forces under the name of the Caliphate army and roused counter-revolutionary outbreaks around Angora, which, however, were put down by the nationalists. When the Allies found themselves embarrassed by the nationalist success, they accepted the offer of Venizelos that the Greek army should advance beyond the area allotted to it in order to deal with the nationalists. In the months of June and July 1920 the Greek army occupied eastern Thrace, and marched on to Brusa and Ushak. On August 10, 1920, the Allies concluded with the sultan's Government in Constantinople the Treaty of Sèvres, which aimed at destroying the independence of Turkey. In Europe, eastern Thrace nearly as far as the Chatalja lines including Gallipoli, was assigned to Greece, and provisionally Greece was also given Smyrna and a zone around it. A tripartite agreement between England, France and Italy laid out French and Italian spheres of influence in parts of those Anatolian territories which under the peace treaty were nominally left to Turkey. The outlines of the Armenia which was to be formed in eastern Anatolia were left to President Wilson to define. The Treaty strengthened the nationalist cause by arousing unanimous indignation. The British forces in Eskishehir withdrew under the pressure of Ali Fuad Pasha's forces. In Cilicia and Aintab the nationalist forces were struggling successfully against the French army and against the Armenian legions under them.

The continual raids by the Armenians of the Armenian republic on the Turkish frontier villages, accompanied by killings and burnings, as well as the necessity for a direct route to Russia, led Turkey to attack the Armenian Republic. The Turkish army captured Kars and Alexandropol, and a victorious peace was concluded with Armenia at Alexandropol, Jan. 3, 1921. A Turkish delegation sent by the Angora Government signed a treaty of friendship with Russia by which Russia recognized the Government of Angora. This, the first recognition of the Angora Government, united her with Russia against the West. The Menshevik government of Georgia was overthrown, and Turkey with the consent of Georgia occupied Ardahan, Artvin and Batum. When the Caucasian republics were federated to Russia, a treaty signed in Kars Oct. 16, 1921, between Russia, the Government of Angora,

ne three Caucasian republics, left Kars, Ardahan and Artvin urkey and restored Batum to Russia.

e defeat of Venizelos in the general elections in Greece and eturn of King Constantine alienated the Allies, especially re. The Greek army in Anatolia started a new offensive, but wice checked by the Turkish army at Inn-Eunu (Jan.–April . The Allies called a conference in London to which repre- ives of both the Government of the sultan and the Govern- of Angora were invited (Jan.–Feb. 1921). At this confer- it became clear that the Allies realized the necessity of ding the Treaty of Sèvres: the Angora delegates initialled ments with the French and Italian Governments which were ccepted by Angora. These agreements nevertheless were the signs of the difference of opinion between the Allies on the sh question. The allied high commissioners at Constantinople result of this dissension announced the neutrality of their rnments on May 18, 1921, and designated neutral zones for- n to the belligerents on each shore of the Bosphorus and the anelles. On July 10, 1921, the Greek army once more passed e offensive and drove the Turkish army east of the Sakaria. e suggestion of a commission of inquiry sent by the Great nal Assembly to the front, Mustafa Kemal Pasha was now nted generalissimo, and after a pitched battle which lasted ays the Greeks were defeated and retired to the east of hehir. Mustafa Kemal Pasha was made marshal and was the title of *Ghazi* by the Great National Assembly.

Franklin Bouillon was delegated by France to negotiate an ment which was signed in Angora on Oct. 20, 1921. It recog- the Angora Government and traced the Turco-Syrian Fron- as later reaffirmed in the Lausanne Treaty. On March 24, the Allies intervened in common to propose a truce between ey and Greece, but the Turks declared that they could only iate after the evacuation of Anatolia. However the Angora rnment sent to Europe, first the commissary of foreign s, and then Fethi Bey, the commissary of the interior, to a peaceful solution. Fethi Bey, especially, arrived in London conciliatory proposals, but during his three weeks' stay, he ot received by any cabinet minister. The Angora Govern- concluded that the question could be settled only by force of

The Greeks, to raise their *moral*, demanded permission to y Constantinople, which the Allies refused. On July 30, Sterighiadis, the Greek high commissioner in Smyrna, pro- ed the autonomy of the Anatolian territory under Greek ation, apparently with the intention of continuing the Ana- war in the guise of a local Greek national movement, in the f the Greek army being compelled to evacuate Anatolia by natic pressure. The Allies proclaimed their neutrality for econd time on August 10, 1922, by the decision of the Su- e Council of War.

e Turkish offensive began on Aug. 26 and the Greek army ompletely routed. On its way from Ushak to Smyrna, it to the ground the most prosperous towns in the west of ey, and atrocities were committed on a large scale. Nearly a n people were homeless. The Turkish army entered Smyrna eptember 9, and the masses of native Christians left the in great disorder. The burning of the town on Sept. 13 ned the general tragedy.

e annihilation of the Greek army brought the Allies face e with the Turkish army on the Asiatic shores of the Straits, eutrality of which had been proclaimed by the Allies. The ion was dangerous. At first England and France agreed to concert in case of necessity by opposing any Turkish viola- f the neutral zones. On Sept. 16, England further announced he British Dominions, Yugoslavia and Rumania, had been to promise military support for maintaining the freedom of raits. This announcement incited the Turks to action, both threatening tone and because it contained no reference to ationalists' territorial demands in eastern Thrace. In conse- e, the Turkish army advanced towards the neutral zone. e and Italy withdrew their troops, and M. Franklin Bouillon ent to Smyrna from Paris to mediate with Mustafa Kemal , and so arrest the march of the Turkish army. The British troops remained alone. On Sept. 23, Lord Curzon came to an agreement with M. Poincaré which accepted the British view regarding the temporary question of the neutral zones, and the French view regarding the definitive peace terms. On the same day, in accordance with this agreement, the principal allied powers invited the Angora Government to a peace conference on two bases; that Turkish sovereignty should be restored in Thrace up to the river Maritza, and that during the interim period, pending the negotiations and entry into force of the Peace Treaty, the inviolability of the neutral zones should be maintained. Meanwhile the Turkish cavalry had advanced almost up to the British wire at Chanak, and only the tact and the firmness of General Harington, as well as his sincere desire to prevent war, averted a disaster. The Nationalists accepted the Allied invitation of Sept. 2 which satisfied the Turkish demands for the territorial settlement in Europe, and suggested a preliminary conference on Sept. 29. On Oct. 13 a military convention was signed at Midania between the Angora delegates, the Allied generals in Constantinople and Greece.

The Allies had also invited the sultan's Government to the peace conference. Tewfik Pasha, the last grand vizier of the Ottoman empire, wrote to the Great National Assembly, proposing joint action, and this made it necessary for the assembly to face the dilemma of having two Governments in one country. In consequence the caliphate was separated from the sultanate; the sultanate was abolished, and the sovereignty of the nation without any restriction, already inserted in the new constitution, was reaffirmed on Oct. 1, 1922. But it was decided to keep the caliphate in the house of Osman. The governmental departments in Constantinople then passed to the Angora Government, which formality was accomplished by Refet Pasha, the Angora Government's high commissioner for Thrace. Thus the house of Osman, which had reigned for seven centuries, came to an end through the treason of its last Sultan, Mohammed VI.; and for the first time in its history Constantinople was no longer the capital of the State to which it belonged. On Nov. 17, 1922, Mohammed VI. took refuge in the British warship "Malaya" and escaped to Malta. The commissary of Sheria deposed the refugee Caliph by a *fetva*, and elected Prince Abdul-Mejid, the son of Abdul-Aziz, as Caliph. The new Caliph recognized the sovereignty of the Great National Assembly, and gave up his claims to the sultanate by a written document. This was the last time the Turks used the *fetva*.

The Lausanne Conference met on Nov. 20, 1922, and signed a peace treaty on July 24, 1923. By it the Turks procured the demands they had put forward in the national pact, except that concerning Mosul. The capitulations were abolished. To realize racial unity in new Turkey the Orthodox Greeks in Anatolia were exchanged for the Muslim Turks in Greek Macedonia: the Greeks of Constantinople and the rest of the Christian minorities were to have the same rights as were secured to other minorities in Europe under the post-war treaties. The tracing of the Turko-'Iraqi frontiers was to be discussed between England and Turkey at a future date, and if necessary to be submitted to the League of Nations. Turkey also concluded treaties with America and Poland which restored diplomatic relations with these countries.

The New Turkey.—The Ottoman empire, which had tried to end the war in 1918 by the armistice of Mudros, was no more. The Turks, the principal element of the defunct empire, had created a new independent Turkish State. The new Turkey had abolished the capitulations and contracted treaties with all the other States. Released from external troubles she was free to begin a new era of progress and reconstruction. The new constitution was not complete, and the position of the president of the national assembly, who was the head of the State at the same time, was vague. Taking advantage of this, during a difficulty in forming a new council of commissaries, Mustafa Kemal Pasha proposed a constitutional amendment by which Turkey would become a republic (Oct. 29, 1923). This amendment was accepted and Mustafa Kemal Pasha was elected the first president of the Turkish republic, and Ismet Pasha, his right hand man, formed a cabinet.

Like all the reformers preceding him, Mustafa Kemal Pasha accepted the clause in the new constitution which declared the State religion to be Islam. But there was a growing conviction

that radical reform would be possible only after freeing the State from religion. Turkey after adopting the republican form of Government was determined to complete the partial secularization of the preceding regime, and to prevent all interference of religious influence, which was regarded as having been the principal obstacle to modernization. The clause in the constitution in declaring Islam the State religion and the position of the *fainéant* caliph were accordingly the first objects of attack. On March 3, 1924, Mustafa Kemal Pasha succeeded in passing three laws at one sitting expelling the Ottoman dynasty; abolishing the Caliphate, the commissariat of *sheria* (the recognized office for the religious affairs) and *eykaff* (pious foundations); and attaching all the educational and scientific institutions, including the *medresses* (religious colleges), to the commissariat of Public Instruction. By these laws the Turkish republic put an end to Pan-Islamism in Turkey and also paralysed the Khilafat movement in British India. The most important step in secularization was the clause of one of the three laws which withdrew the "civil transaction" section of the *sheria*, which so far had dominated the Turkish code through the *mejelle* (Turko-Islamic code). The dispatch of all concerns and cases which related to dogma and religion passed to an office called the "Presidency of Religious Affairs." Thus for the first time Turkey tried to separate religion from the State. Of the two classes, the *ulema* and the military, which had dominated the Turkish State, the *ulema* were no more. The military, from the time of the *tanzimat*, had nominally ceased to interfere in internal politics. But in spite of this, the deposition of Abdul-Aziz (1876), the re-establishment of the constitution (1908), the nationalist movement (1918) were all brought about through the army. And although during the last and most important changes of regime, including State secularization, military influence was not obvious, the force behind the throne in the Turkish state was still the army. A month before the passing of these laws Mustafa Kemal Pasha assembled the commanders of the army in Smyrna and discussed these questions with them, thus diplomatically shifting the responsibility to the shoulders of the army in case of any public opposition. A new constitution which was more democratic than that of England was adopted on April 20, 1924. To win over the peasantry, who constituted the majority and who did not regard these radical measures favourably, the tithes, which lay heavily on the agricultural classes, were abolished and military service was reduced to 18 months. The deficit in the revenue, due to the abolition of the tithes, was met by a heavier taxation of the urban population.

Although constitutionally the national sovereignty was in the hands of the national assembly, Mustafa Kemal Pasha, through his personal prestige won in the field, and through his hold over the army, showed decided tendencies towards a personal dictatorship. This created an opposition under Rauf Bey and Kiazim Kara-Bekir Pasha, which attempted to keep the republic on a democratic and liberal basis, and was called the Republican Progressive Party (Nov. 1924). Ismet Pasha's cabinet fell and Fethi Bey, a liberal and moderate statesman, formed a new cabinet. The Kurdish provinces revolted, because they resented the extreme centralization and the harsh measures of the Government in carrying out new reforms, and because of the separatist tendencies of some of the leading chiefs. Mustafa Kemal Pasha seized this as a pretext to strike at the opposition. Pretending that the liberal clause in the Progressive programme which advanced liberty of conscience had encouraged this rising, he, after a long discussion in the party meeting, during which he spoke for six hours, forced the Fethi Bey cabinet to resign, on the ground that it had refused to carry out drastic measures in the peaceful parts of Turkey. Ismet Pasha formed a cabinet for the second time. The "law of maintenance of order" was passed.

The Dictatorship.—With the passing of this law, the tribunals of independence, which had functioned during the nationalist struggle against the anti-nationalists, were revived. A reign of terror both against the Kurdish insurgents and the members of the opposition began. The opposition Party was suppressed. The freedom of speech which the new constitution had accorded to the Turkish nation was evaded through the very vague terms of the Law. Mustafa Kemal Pasha was able to establish his dictat ship, despite a most democratic assembly, by the absence of a clause in the constitution which would place the president of t republic above parties. Therefore Mustafa Kemal Pasha, as t active president of his own Party, could wield unbounded pow The Kemalist Party (People's Party), like Abdul-Hamid and t Committee of Union and Progress, believed that the Turkish tion was not yet ready for a liberal regime. Although the Kurd insurrection was put down by tribunals and military operatio the disturbances continued in Van, Bitlis and Diarbekir, and the republic to begin a partial deportation of the Kurds. T reforms of the republic were carried out by the terrorist meth of Mahmoud II. The religious orders were abolished and *tekkes* (monasteries) were closed as having influenced the Ku ish rising. A decree ordered the army to adopt a képi and the ci servants to wear hats. A law passed in Nov. 1925 abolished t fez and obliged everybody to wear hats. (Women were not cluded.) This law provoked several counter-revolutionary risi in the eastern provinces, which the tribunals suppressed by de sentences and imprisonments. On Feb. 17, 1926, the assem adopted a new civil code which was almost a translation of t Swiss code; and this is the most fundamental of the rec changes. By the adoption of this code Turkish legislation w wholly freed from Islamic influence. The laws concerning m riage, divorce and inheritance, which had been totally differ from those of the West, were altered, and polygamy was lega prohibited. This radical secularization led the non-Muslim min ities to renounce of their own accord the minority rights wh they had procured at the Lausanne conference. The secular repu lic had now only two points of contact left with religion; the cla in the constitution which states that the religion of the State Islam, and the law which attached the Presidency of Religi Affairs to the prime minister's office. The former of these w broken on April 9, 1928, by a decree of the assembly annulling t clause in question and also that by which the assembly has execute the *sheri* (holy law). The decree also substituted t oath "by Allah" by the oath "by my honour."

On May 19, 1924, a conference assembled in Constantinople trace the Turko-'Iraqi frontier, which had been left over by t Lausanne Conference. No result was achieved and in accorda with the decision of the Lausanne Conference, England and T key submitted the question to the League of Nations. On D 16, 1925, the League of Nations decided to give the vilayet Mosul to 'Iraq. To this the Turks would not consent and in p test, the Turks, on Dec. 17, 1925, concluded in Paris a treaty mutual neutrality for three years with Chicherin, the Russi commissary of Foreign affairs. Turko-Russian relations, wh had become distant since the Lausanne Conference, once m became very close. To reassure Russia, who watched Pan-Tura anism in Turkey with some anxiety, the Turk Ojaks (natio clubs) issued a declaration, stating that Turkish nationalism w cultural and local and had no Pan-Turanian aims. Finally in t summer of 1926, the British, Turkish and 'Iraqi representativ met in Angora and signed a treaty on June 5, which ceded t vilayet of Mosul to 'Iraq with a slight rectification of the front in favour of Turkey: for a period of 25 years from the comi into force of the Treaty, the 'Iraq Government was to pay Turk 10% on all royalties it received from the exploitation of t Mosul oil. On April 22, 1926, a treaty of neutrality was conclud with Persia. A treaty of perpetual peace and friendship was sign with Afghanistan in Angora on May 27, 1928, and a treaty of no aggression and arbitration with Italy on May 30, 1928.

On the pretext of a conspiracy against Mustafa Kemal Pasha life, "discovered" in the summer of 1926, all the members of t suppressed Opposition Party, both in and out of the assembly, well as the leading members of the Union and Progress Part were arrested by the tribunal of independence. At the trial poli cal opponents were assumed to be conspirators by the mere fa of their being in the Opposition. Kiazim Kara Bekir Pasha, A Fuad Pasha and Refet Pasha were acquitted by the pressure of t army. Several members of the assembly, whose parliamenta immunity was violated and who had been in the forefront of t

tionalist movement, were executed. Djavid Bey, the foremost Turkish financier, Shukri Bey, Dr. Nazim Bey and Janpoulant Bey, ex-ministers of the Unionist regime and some of them deputies, were also executed. The ex-prime minister Rauf Bey who was in Europe at the time, was condemned to ten years' imprisonment. These terrorist and illegal measures aimed at extinguishing any form of opposition.

The economic policy of the republic, a reaction to that of capitulations under which the Turks had suffered so much, was anti-nationalist. State construction of railways was begun, and lines between Angora and Caesarea, and between Samsoun and Anatolia were completed in 1927.

In the summer of 1927 the general elections took place; Kemal-ist Party candidates were all elected and Mustafa Kemal Pasha was elected president of the republic for the second time. In April, 1928, the article of the constitution declaring Islam the official religion of the republic was eliminated by a unanimous vote of the Assembly. The same body enacted a bill substituting Roman characters for the Arabic in all official documents. After a 15 months' period of education it is intended to make the general use of the new alphabet compulsory.

(A. A. A.)

TURKEY, an abbreviation for turkey-cock and turkey-hen, large domestic gallinaceous bird, so called from the mistaken belief that it came from Turkey. They (*Meleagris*) are all American and were not introduced into Europe before 1530. The Mexican (*M. gallopavo*) is extinct in the settled parts of Canada and the north-eastern parts of the United States. It is a beautiful bird, with bright, metallic gloss on its plumage. The Mexican species (*M. mexicana,* Gould), now rare, differs in having its tail-coverts and quills tipped with white. On the borders of Guatemala and British Honduras is a third species, *M. ocellata,* whose plumage vies in splendour with that of the peacock, while the bare skin of the head is blue, studded with orange warts. The turkeys form the subfamily *Meleagrinae* of the *Phasianidae* and are found back to the Miocene, when they were present in Colorado. The domestic turkey (the South American *M. Mexicana*), domesticated by the peoples of Mexico and Peru, was introduced into Europe by the Spaniards soon after the discovery of America. From Europe, most probably, the earliest domesticated turkeys were taken to North America by colonists from Europe and little admixture of wild blood (*M. Gallopavo*) occurred until after the middle of the last century when livestock began to be improved. In 1865, the original Mexican stock was known in England as the Cambridge Bronze, and there were also the Black Norfolks, Buffs and Fawns (buffs). Of these the Cambridge Bronze was the largest, the Black Norfolks the most popular.

Later there arose a demand for a turkey of greater size and so there was imported from North America the American Bronze, of less white and more brilliant colouring. These were bred with the Cambridge and with the general turkey population of the continent. But the great size of the American Bronze is unsuited to the purse of small incomes and small families. The marketable weight now is one of 10–15 lb. and the older European varieties have come into their own again. The White turkey, called for reasons of its own the Austrian White in Europe, the White Holland in America, is exceedingly popular, and Blacks and Fawns are also kept. Infrequently the other colour varieties are imported from America into Europe, the Slate, the Narragansett and the Bourbon Red. All these pigments are ingredients of the Bronze colouration and the breeder, by isolating and forming new combinations of them, has produced the different varieties.

(F. A. E. C.)

United States.—From colonial days the turkey has been the *pièce de résistance* at the feast of the national Thanksgiving Day.

The Bronze turkey is the largest and most popular. The standard weights in pounds are: adult cock, 36; yearling cock, 33; cockerel, 25; hen, 20; pullet, 16. The plumage is distinguished by a rich brilliant, bronze sheen with white barring of the wings and edging of tail feathers.

The White Holland is the second most popular turkey. It is, perhaps, more easily handled in confinement than the other varieties. The standard weights in pounds are: adult cock, 28; yearling cock, 24; cockerel, 20; hen, 18; pullet, 14. The White Holland is pure white and the plumage should be free from black flecks or ticking in all sections.

The Bourbon Red is the newest standard American variety, with growing popularity. The standard weights in pounds are: adult cock, 30; yearling cock, 25; cockerel, 20; hen, 18; pullet, 14. The general plumage colour is a rich brownish red, with the primary and secondary feathers of the wing and the main tail feathers of pure white.

(M. A. J.)

TURKHEIM. At the end of 1674 the imperial army under Bournonville had crossed the Rhine at Strasbourg and invaded Alsace (*see* DUTCH WARS and TURENNE). After an indecisive battle at Enzheim, Turenne, the French commander, withdrew northwards as if for the defence of Lorraine; thereupon the imperialists spread themselves into winter quarters over southern Alsace. This was exactly what Turenne wanted; leaving only a screen of cavalry posts in northern Alsace, he re-entered Alsace from the south at Belfort. The imperialists were taken by surprise; several bodies were captured or dispersed, and a rapid thrust at Strasbourg might have been decisive. But the long march in winter had exhausted Turenne's men, and when at last he did move northwards the allies had had time to concentrate their army, 50,000 strong, in a formidable position between Colmar and Turkheim. With only 35,000 men, Turenne saw that a pitched battle might end in failure; he therefore decided to manoeuvre his enemy out of position. Giving half his force to the Comte de Lorge, he ordered him to demonstrate particularly against the town of Colmar, on their left.

As he had hoped, the imperialists at once began to move troops from their right and centre for the defence of Colmar, whereupon Turenne, who had moved the rest of his army under cover of some hills close up to the enemy's right, sent Foucault forward with 12 battalions and some cavalry and guns to cross the stream near its junction with the Fecht. This attack was timed to begin an hour before sunset, because Turenne did not wish to be drawn into a general engagement but only to frighten the imperialists into withdrawing in a night panic. Foucault advanced too soon, however, and had to wait for some time under heavy artillery fire, while the imperialists had time to move some of their troops back towards the right. At 3 P.M. (on Jan. 5, 1675) Foucault attacked and brilliantly forced the imperial right back upon their centre. As Turenne had anticipated, the imperialists, fearful that their flank was turned, fell back upon Strasbourg. The losses were unimportant, but the battle was decisive, Alsace being cleared of its invaders.

TURKI, strictly speaking an Arabic or Persian adjective formed from Turk, used by European writers in two rather different senses. (1) It is applied to tribes or languages which are Turkish as opposed to Aryan, Semitic, etc. (2) It is used as the special designation of the tribes and languages of Kashgaria and Eastern Turkistan. (*See* TURKS.)

TURKI LANGUAGE. The dialects of the Turkish language may be roughly divided into four main groups, namely (1) the oriental dialects of the Altai, (2) the western dialects including Kirghiz, Bashir, and the Tatar of the Volga, (3) the dialects of Central Asia with which this article will deal, and (4) the

southern dialects, including Turkoman, Azerbaijani, Anatolian, Crimean and modern Ottoman Turkish (Osmanli). These dialects differ in a remarkably small degree from one another. There are, however, two Turkish dialects, namely, the Yakut and the Chuvash, which, owing to their isolation, have undergone considerable modification. The Central Asian dialects which are spoken from the eastern frontiers of Persia as far as Hami on the edge of the Gobi desert include Taranchi, the Turki of Hami, Aqsu, Kashgar, Yarkand, Sart, the dialect of Kokand, and the Uzbeg of Bokhara and Khiva. The literary language of Chinese Turkestan is known as Eastern Turki or Jaghatai from the name of one of the sons of Jenghiz Khan who founded a Khanate in this region at the beginning of the 13th century. The first monuments to be discovered of the ancient Turkish language were those contained in the Orkhon inscriptions dating from the 8th century which were written in a Runic character. They were known to exist in 1730, but were only deciphered in 1893 by the Danish scholar Vilhelm Thomsen. Since then a vast manuscript literature in a similar language, both in Runic and in other alphabets notably the Uighur (derived through Sogdian from the Aramaic) has been rescued from under the sands of Central Asia. (Documents have also been found in Estrangelo [two forms], Brahmi, and even Tibetan.) When the Uighur alphabet was introduced is not exactly known, but it must, at a later stage, have overlapped with the Runic alphabet which was certainly employed in the 6th century of our era. Although with the submission and consequent conversion of Chinese Turkestan to Islam a vast number of Arabic words were introduced into the Turki language, the number of these was far smaller than was the case with Osmanli Turkish, and consequently old roots have been preserved in Turki which have almost entirely disappeared from the westerly dialects. The Uighur alphabet was still in use in the 12th century and mss. have been found dating from the 15th century, but owing to the influence of the Arabian culture, it was finally discarded in favour of the Arabic alphabet. The Turki language spoken to-day from Yarkand to Hami is practically identical with the Turki of the 10th century. Down to the 14th century very few literary works were produced in Turki, but in the 15th, 16th and 17th centuries there appeared a large number of distinguished writers in that language among whom may be mentioned the great poet and patron of poets Mir Ali Shir Navai, the Sultan Babur and the historian Abul-Gazi Bahadur Khan. The characteristics of the Turkish languages have been described elsewhere. (*See* TURKISH LANGUAGE AND LITERATURE.) Turki is rich in verbal affixes which modify the root meanings. Shaw cites an example which illustrates the manner in which these affixes may be multiplied in a single word—in *Birilishturalmaidurman. Birmaq* is "to give"; *almaq* is "to take"; *biralmaq* is "to be able to give"; *biril* is "to be given"; *birilish* is "to be given to one another"; *birilishtur* is "to cause to be given to one another"; *mai* is the negative; *dur* is the present tense; *man* indicates 1st person singular. The whole thus means "I am unable to cause (them) to be given to each other."

Berlin, 1912–14); G. Raquette, *English-Turki Dictionary* (Lund, Leipzig, 1927).

TURKISH LANGUAGE AND LITERATURE. Turkish, now generally understood as referring to the Osmanli or Ottoman Turkish speech of Europe and Asia Minor, is correctly the name of a family of tongues. The Turks were known to China in the 6th century A.D., and the Turkish inscriptions from the Orkhon river district in northern Asia bear dates from before the middle of the 8th century. The best known divisions of the Turks are the Uigurs, the Seljuks, and the Osmanlis. The last-named took Constantinople in 1453 and set up the Ottoman empire. (*See* TURKEY.)

The root of the name is *türk*, meaning "power" (or, as some authorities have it "to arrive at maturity"). The name is found in many languages from China to the Caucasus, but was not used by the Turks until the beginning of the present century. The Turkish languages are spoken over 140 degrees of longitude, from Macedonia to Siberia, and are characterized by a remarkable homogeneity. These languages are everywhere easily identifiable and leave ineffaceable marks on surrounding tongues (*e.g.*, in Mongolia and Siberia). The Asiatic Turks were at different periods decidedly forceful and their languages made attacks on other speech systems, analogous to those physical assaults made by the Turks on surrounding peoples.

A prominent feature of the Turkish languages is the vocal harmony (prevailing throughout the family) upon the eight vowels, *ä, ï, ö, ü; a, i, o, u.* The Turkish tongues are sweet-sounding and a comprehensive scheme of vowel-attractions governs the euphonic interests of the family. Nouns are declined and compounds can be built up by adding suffix to suffix: from *chal* (*mak*), "play a musical instrument" *chal-gi*, "a musical instrument"; *chal-gi-ji* "a musician," and with *-lär* (a sign of the plur.) *chal-gi-ji-lär*, "musicians." This building up from a stem is seen to perfection in the verb. The declension of nouns now comprises genitive, dative, accusative, locative, and ablative, although in earlier times there were other cases. The plural (marked by the suffixes *-lär, -tär, -där,* and *-när*) is not invariably used: bir tavuk satmak, "to sell $\left\{\begin{matrix}\text{a}\\\text{one}\end{matrix}\right\}$ hen," *tavuk satmak*, "to sell hens." The copula is frequently omitted, in which event the order of words reveals the sense: *oglan ögsüz* (lit. "boy orphan"), the boy is an orphan, and *ögsüz oglan*, "a boy orphan."

The usual copula in the Turkish languages is the zorist of *durmak*, "to stand up." "The boy is an orphan" with the copula expressed would be *oglan ögsüz tur-ur.* The construction of the sentence is accomplished by use of pronouns both before and after the predicate in accordance with the following table. (In the post-predicate position the pronoun is merely an enclitic.)

Verb and Pronoun Prefixes and Suffixes

Number and person.	Independent personal pronouns.	Copula suffix	Imperative suffix.	Possessive suffix.
Singular				
1st. pers.	*ban, man, min*	*-ban, -van* *-man, -min, etc.*	*-ay, -ayin* *-iyin,* etc.	*-m*
2nd pers.	*san, sin*	*-sin*	*-kil*	*-ng*
3rd pers.	*ol, ul*	*-durur, -dir*	*-sin, zin*	*-(s)i, -i*
Plural				
1st pers.	*biz, bis*	*-biz, bis*	*alim*	*-biz*
2nd pers.	*siz, sizler*	*-siz, -sizler*	*-iniz, -igiz*	*-ngiz*
3rd pers.	*olar, ular*	*durur, dirlar*	*-sin, -sinlar*	*-lari*

Suffixes to the general verb are of two kinds, (*a*) those forming nouns of action (*tran*), or in Osmanli *-dik* and (*b*) predicative suffixes which form other tenses or moods of the verb. These are added to the base, *e.g.*, from *atmak* (to throw), base *at*+suffix *-in* or *-iniz* gives the imperative *atin, atiniz*, "throw!" Frequently however, the base alone is used as an imperative and, except in its written form, the Turkish language in whatever dialect it is found is far from stable.

The Turkish numeral system is decimal. It is nearly, but not quite, uniform throughout the languages; it is possible that the parent idiom had not developed a complete system before the break-up of the primal family. In certain cases the colloquial has borrowed one or two number-names from surrounding peoples. The Osmanli Turkish numerals are:

1, *bir*, 2 *iki*, 3 *uch*, 4 *dört*, 5 *besh*, 6 *alti*, 7 *yedi*, 8 *sekiz*, 9 *doqus* 10 *on.* Eleven is *on bir*, and so regularly to 20, which is *yirmi*; 30 *otuz;* 40 *kerk;* 50 *elli;* 60 *almish;* 70 *yetmish,* and so regularly to 100 (*yuz*). One thousand is *biñ.*

The general outlines of the language have remained unchanged throughout the centuries, but in details there are wide difference between the languages of the different localities. The modern Ottoman (Osmanli) Turkish differs very widely from the Turkish tongues of northern Asia. It is much more harmonious to the

l much simpler in grammatical structure. It is a difficult o trace the development of written Turkish from the *rk* or pseudorunic script of the Orkhon regions through the script of Mongolia and Turkestan to the modern use in and central Asia of the Arabic script adapted to Turkish For Turkish has used several different scripts, writing in characters (*Estrangelo*) and a modified form of this script Manichaean, in Brahui (*q.v.*), in Tibetan, in Armenian and Hebrew. The most modern development is the deci- the decree of the Turkish government in 1928 that the alphabet should be universally substituted for the Arabic

TOGRAPHY.—The following issues of the *Journal of the Finno- Society* deal specifically with Turkish languages: v. 1894–96; 8–99; xxx. 1912; xxxvii. 1916; liv. 1925. *See* also *Inscriptions khon Helsingfors* (1892); O. Donner *Sur l'origine de l'alphabet Nord de l'Asie;* G. J. Whitaker, *Eastern Turki*; Barbier de Meynard, *Dictionnaire Turc-français* (1881–86); Thomsen, *Samlede Afhandliger* (1922); and the bibliographies ng quarterly in the *Journal of the Royal Asiatic Society*. The characteristics of Turkish languages are treated in *Les Langues nde* (Paris, 1924). (A. N. J. W.)

LITERATURE

ing the rule of the Ottoman Sultans the Turks gave little literary inventiveness and the two great schools, the old e new, into which we may divide their literature were modelled, the one after the classics of Persia and the other hose of modern Europe, and more especially of France. st 30 years have seen a steady development of the new which, from being at first imitative or adaptive, has now out a line of its own. Turkish literature has not however d time to manifest its reaction to recent drastic political ligious changes. Its most modern writers all belong to the preceding the rise of Mustafa Kemàl Pasha, and even the advanced thinkers among Turkey's men of letters have ventured under former régimes even to hint at such reforms e been carried out by the order of one man. The old school e conveniently divided into three periods, which may be respectively the pre-classical, the classical and the post- al. Of these the first extends from the early days of the to the accession of Suleimān I., 1301–1520 (700–926); ond from that event to the accession of Maḥmūd I., 1520– 926–1143); and the third from that date to the accession d-ul-'Azīz, 1730–1861 (1143–1277).

Pre-classical Period.—The works of the old school in periods are entirely Persian in tone, sentiment and form. two centuries before the arrival of the Turks in Asia the Seljūḳs, then a mere horde of nomads, had overrun where they settled and adopted the civilization of the they had subdued. Thus Persian became the language of ourt and Government, and when by-and-by they pushed conquests into Asia Minor, and founded there the Seljūḳ of Rūm, they carried with them their Persian culture, and d it among the peoples newly brought under their sway. among the descendants of those Persianized Seljūḳs that ed Ottoman Turks rose to power in the middle of the 13th y (*see* TURKS). The Ottomans naturally absorbed the of the Seljūḳs, and an extraordinary love of precedent, nt in all Islamic literature, was sufficient to keep their loyal to their early guide for centuries till at length the nce, though not the fashion of it, changed and, about the of the last century, Paris replaced Shīrāz as the shrine s which the Ottoman scholar turned. The poetry of the old is greatly superior to the prose.

man literature may be said to open with a few mystic lines, rk of Sultān Veled, son of Maulānā Jelāl-ud-Dīn, the author great Persian poem the *Mathnawī*. Sultān Veled flourished the reign of 'Osmān I., though he did not reside in the y under the rule of that prince. Another mystic poet of rly time was 'Āshiḳ Pasha, who left a long poem in rhyming couplets, which is called, inappropriately enough, his *Dīvān*. The nocturnal expedition across the Hellespont by which Suleimān, the son of Orkhan, won Gallipoli and therewith a foothold in Europe for his race, was shared in and celebrated in verse by a Turkish noble or chieftain named Ghāzī Fāzil. Sheikhī of Kermiyān, a contemporary of Moḥammed I. and Murād II., wrote a lengthy and still esteemed mesnevī on the ancient Persian romance of Khusrev and Shīrīn; and about the same time Yaziji-oghlu gave to the world a long versified history of the Prophet, the *Muḥammediya*. The writers mentioned above are the most important previous to the capture of Constantinople; but there is little literature of real merit prior to that event. The most notable prose work of this period is an old collection of stories, the *History of the Forty Vezirs*, said to have been compiled by a certain Sheikh-zāda and dedicated to Murād II. A few years after Constantinople had passed into the hands of the Ottomans, some ghazels, the work of the contemporary Tatar prince, Mīr 'Alī Shīr, who under the *nom de plume* of Nevā'ī wrote much that shows true talent and poetic feeling, found their way to the Ottoman capital, where they were seen and copied by Aḥmed Pasha, one of the viziers of Moḥammed II. The poems of this statesman, though possessing little merit of their own, being for the most part translations from Nevā'ī, form one of the landmarks in the history of Ottoman literature. They set the fashion of ghazel-writing; and their appearance was the signal for a more regular cultivation of poetry and a greater attention to literary style and to refinement of language. In Sinān Pasha (d. 1420), another minister of Moḥammed the Conqueror, Ottoman prose found its first exponent of ability; he left a religious treatise entitled *Tazarru'āt* (Supplications), which, notwithstanding a too lavish employment of the resources of Persian rhetoric, is as remarkable for its clear and lucid style as for the beauty of many of the thoughts it contains. Twenty-one out of the 34 sovereigns who have occupied the throne of 'Osmān have left verses, and among these Selīm I. stands as the most gifted and most original poet. The most prominent man of letters under this sovereign was the legist Kemāl Pasha-zāda, who left a romantic poem on the loves of Yūsuf and Zuleykhā, and a work entitled *Nigāristān*, which is modelled both in style and matter on the *Gulistān* of Sa'dī. His contemporary, Mesīhī, whose beautiful verses on spring are perhaps better known in Europe than any other Turkish poem, deserves a passing mention.

Classical Period.—With the accession of Selīm's son, Suleimān I., the classical period begins. Fuzūlī (d. 1563), showed far more originality than any of his predecessors; for, although his work is Persian in form and in general character, he struck out a new line for himself. Bāḳī (d. 1599) of Constantinople, though far from rivalling his contemporary Fuzūlī, wrote much good poetry. The Ottomans have been particularly successful with elegies; one by Bāḳī on Suleiman I. has never been surpassed. Rūhi, Lāmi'ī, Nev'ī, the janissary Yahya Beg, the muftī Ebū-Su'ūd and Selīm II. all won deserved distinction as poets. During the reign of Aḥmed I. arose the second of the great poets of the old Ottoman school, Nef'ī of Erzerūm, who owes his pre-eminence to the brilliance of his ḳasīdas. Nābī (d. 1712), who flourished under Ibrāhīm and Moḥammed IV. was a prolific author who imparted into Ottoman literature, a didactic style of ghazel-writing which was then being introduced in Persia by the poet Ṣā'ib; indeed, it is not always easy to know that his lines are intended to be Turkish. A number of poets took Nābī for their model. The glory of the classical period ending with Nedīm, dates roughly from the accession of Aḥmed I. 1603 (1012), to the deposition of Aḥmed III., 1730 (1143).

We will now glance at the prose writers of this period. Under the name of *Humāyūn Nāma* (Imperial Book) 'Alī Chelebi made a highly esteemed translation of the well-known Persian classic *Anvār-i Suheylī*, dedicating it to Suleiman I. Sa'd-ud-Dīn (d. 1599), the preceptor of Murād III., wrote a valuable history of the empire from the earliest times to the death of Selīm I. This work, the *Tāj-ut-Tevārīkh* (Crown of Chronicles), is reckoned, on account of its ornate yet clear style, one of the masterpieces of the old school, and forms the first of an unbroken series of annals

which are written, especially the later among them, with great minuteness and detail. Of Sa'd-ud-Dīn's successors in the office of imperial historiographer the most remarkable for literary power is Na'īmā. His work, which extends from 1591 (1000) to 1659 (1070), contrasts strongly with that of the earlier historian, being written with great directness and lucidity, combined with much vigour and picturesqueness. Evliyā, who died during the reign of Moḥammed IV., is noted for the record which he has left of his travels in different countries. About this time Ṭash-köprizāda began and 'Aṭā-ullāh continued a celebrated biography of the legists and sheikhs who had flourished under the Ottoman monarchs. Ḥājī Khalīfa, frequently termed Kātib Chelebi, was one of the most famous men of letters whom Turkey has produced. He died in 1658 (1068), having written a great number of learned works on history, biography, chronology, geography and other subjects. The Persianizing tendency of this school reached its highest point in the productions of Veysī, who left a *Life* of the Prophet, and of Nergisī, a miscellaneous writer of prose and verse. The first printing-press in Turkey was established by an Hungarian who had assumed the name of Ibrāhīm, and in 1728 (1141) appeared the first book printed in that country; it was Vanḳuli's Turkish translation of Jevheri's Arabic dictionary.

Post-classical Period.—Coming now to the post-classical period, we find among poets worthy of mention Belīgh, Nevres, Ḥishmet and Sunbuli-zāda Vehbī, each of whom wrote in a style peculiar to himself. Three poets of note—Pertev, Neshet and Sheikh Ghālib—flourished under Selīm III. The last-named is the fourth great poet of the old school. *Ḥusn u 'Ashḳ* (Beauty and Love), as his great poem is called, is an allegorical romance full of tenderness and imaginative power. Ghālib's style is as original as that of Fuzūlī, Nef'ī or Nedīm.

When we reach the reign of Maḥmūd II., the great transition period of Ottoman history, during which the civilization of the West began to struggle in earnest with that of the East, we find the change which was coming over all things Turkish affecting literature, along with the rest, and preparing the way for the appearance of the new school. The chief poets of the transition are Fāzil Bey, Wāṣif, 'Izzet Molla, Pertev Pasha, 'Ākif Pasha, and the poetesses Fitnet and Leylā. In the works of all of these, although we occasionally discern a hint of the new style, the old Persian manner is still supreme.

More intimate relations with western Europe and a pretty general study of the French language and literature, together with the steady progress of the reforming tendency fairly started under Maḥmūd II., resulted in the birth of the new or modern school, whose objects are truth and simplicity. The transformation of Turkish literature and the creation of the Young Turk party were alike due to three great men, Shināsī, Kemāl and Ziyā. Shināsī's small volume of translations from various French poets appeared in 1859. In the following year he founded the first non-official journal in Turkey, in which he published in simple language articles dealing with the scientific and social questions from a modern European point of view. The first work of fiction ever translated into Turkish was Fénélon's *Télémaque* which appeared in 1862, the translator being Yusuf Kemāl Pasha. It was Ahmad Midhat who conceived the idea of writing stories depicting Turkish life and manners. The first collection of national tales appeared in 1870. In 1869 Ahmad Vefiq Pasha published translations of three of Molière's comedies, adapting the scenes and the names to suit local conditions. In 1871 appeared the first original Turkish drama, a form chosen by Abd-ul-Haqq Ḥāmid for his best poetry.

The Revolution of 1908.—The turning point in Turkish national conscience came with the Revolution of 1908, which marks the beginning of a new era. With the rise of democracy there naturally was felt the need of a closer collaboration between the cultivated classes and the people who had for centuries been kept at a distance from one another for the reason that men of letters only wrote for a small circle of intellectuals in a language and on subjects which were untelligible to the lower classes. The battle cry of the new school was *Khalga doghru*, "towards the people," and societies were formed like the Türk Derneyi at Constantinople and the Yeni Lisanjilar at Salonica, whose object was to introduce a new literary language adapted to the un standing of the people and a literature free from foreign influe Among the foremost workers in this new field were 'Alī Jā Omar Saifeddīn, and Ziyā Gök Alp (1875–1925), the real fou of the new Turkish nationalist movement, and last but not Mehmed Emīn, a religious poet who came of lowly stock an spokesman for the people has enjoyed very special popularity. new movement found its first expression in newspapers, an the new writers began as journalists or novelists or as poets tributing to newspapers. Among those who have attained highest rank may be mentioned the following writers: Te Fikret (d. 1915), Jenāb Shehāb ad-Din (b. 1877), Nigar Khan a distinguished poetess (1871–1918), Mehmed 'Ākif (b. 18 Khalīd Ziyā, Ahmad Hikmet (b. 1879), Mehmed Ra'uf (b. 18 Ya'qub Qadri (b. 1889), Khalidé Edib Hanum (b. 1883) Husein Jahid (b. 1875). Literary criticism is notably represe by Köpruli Zadé Mohammed Fūad Bey, one of the professor Constantinople university, an ardent scholar who is engage compiling a new history of the Ottoman literature. (E. D. R

TURKISTAN, a name conventionally employed to desig the regions of Central Asia which lie between Siberia on the and Tibet, India and Afghanistan on the S., the western li being the Caspian Sea and the eastern Mongolia and the De of Gobi. Etymologically the term is intended to indicate regions inhabited by Turkish races. The regions called Turki not only contain races which do not belong to the Turk fam but exclude races which do, *e.g.,* the Turks of the Otto Empire. What was formerly called Eastern Turkistan is mainly the southern portion of the Chinese dominion of Sin-ki (*q.v., see* also Tarim, etc.), while the former West Turkista included in the Uzbek, Turkmen, Kazak, Kirghiz and Tad Socialist Soviet Republics (*qq.v.*).

HISTORY

Our knowledge of the history of Turkistan is very fragment until about the beginning of the Christian era. It may be at a very early period East Turkistan was inhabited by an Ar population. When the Huns (Hiung-nu) occupied west and Mongolia in 177–165 B.C. they drove before them the Yue (*q.v.*), who divided into two hordes, one of which invaded valley of the Indus, while the other met the Sacae in East T kistan and drove them over Tian-shan into the valley of Ili. Thus, by the beginning our era, the Tarim region ha mixed population of Aryans Ural-Altaians, some being sett agriculturists and others noma There were also several in pendent cities, of which Kho was the most important. portion of the Aryans emigra and settled in what is now Wakhhan (on the Pamir platea the present language of which seems very old. Between 120 101 B.C. the Chinese extended their rule westwards over E Turkistan as far as Kashgar. By the end of the 5th century western parts fell under the sway of the "White Huns" (Epht lites, or Tochari), while the eastern parts were under Tan (Thygun) dominion. An active trade was carried on by me of caravans, corn and silk especially being mentioned at a ve early date.

inese Turkistan.—In the and 15th centuries Bukhara and Samarkand became cen- of Muslim scholarship and sent great numbers of their ed doctors to Kashgaria. Rubruquis, who visited East stan in 1254, Marco Polo between 1271 and 1275; and in 1680 all bore witness to great religious tolerance; his entirely disappeared with the invasion of the Bukha- mullahs or Mohammedan priests. In the 17th century erful Kalmuck confederation arose in Dzungaria, and ex- its sway over the Ili and Issyk-kul basins, having its on the Ili. To this power or to the Kirghiz the "Whites" "Blacks" alternately appealed in their struggles, in which nd supported the latter and Kashgar the former. The se entered Dzungaria in 1758, the Kalmucks fled, and garia became a Chinese province, with a military coloniza- of Sibos, Solons, Dahurs, Chinese criminals and Muslim gars. The Chinese next re-conquered East Turkistan, mark- eir progress by massacres and transporting 12,500 partisans dependence to the Ili (Kulja) valley. Hereupon the dis- nt khojas fled to Khokand in West Turkistan and there ed armies of malcontents and fanatic followers of Islam. al times they succeeded in overthrowing the Chinese rule 825, in 1830 and in 1847—but their successes were never nent. In 1857 another insurrection broke out; but a few s later the Chinese again took Kashgar. In the course of zungarian outbreak of 1864 the Chinese were again expelled, Yakub Beg became master of Kashgar in 1872. But five later he had again to engage in war with China, in which s defeated, and East Turkistan once more became a Chinese ce; it is now known under the general name Sinkiang, to- with Kulja and Kashgaria.

Russian Turkistan.—Soviet Central Asia comprises part of Turkistan. Since Russia conquered Turkistan about Tashkent and Samarkand were occupied and further terri- vas absorbed and the whole united into Russian Turkistan. 1917 Russian Central Asia consisted of several territories, ing the governor-generalship of Turkistan. After the revolu- he Soviet Government established its power in these districts, he khanates of Khiva and Bukhara were destroyed (1920). same year was set up a Peoples' Soviet Republic and the former governor-generalship of Turkistan became an Autonomous Socialist Soviet Republic within the R.S.F.S.R. in 1921. In 1925 a redistribution took place and the new States of Uzbekistan, Turkmenistan and Tajikistan, together with several autonomous regions, were set up. The remaining Turkistan areas were linked with the Autonomous Kirghiz Socialist Soviet Republic.

Afghan Turkistan.—Afghan Turkistan, now called the Mazar Province, the northern province of Afghanistan, is bounded on the east by Badakhshan, north by the Oxus river, north-west by Russia, and south by the Hindu Khush, the Koh-i-Baba, and the northern watershed of the Hari Rud basin, which separates it from the Herat Province. Its northern frontier was decided by the Russo-Afghan Agreement of 1873, and delineated by the Russo-Afghan Boundary Commission of 1885, which gave rise to the Panjdeh incident. With a length of some 500 m. and an average breadth, north to south, of 114 m., it comprises about 57,000 sq.m., or two-ninths of the kingdom of Afghanistan. Except in the river valleys it is a poor territory, rough and mountainous towards the south, but subsiding into undulating wastes and pasture lands towards the Turkman desert, and the Oxus riverain, which is highly cultivated. The population, which is mostly settled in and around its towns and villages, is estimated at 800,000. The principal town is Mazar-i-Sharif.

The bulk of the people are of Persian and Uzbeg stock, interspersed by Mongol Hazaras and Hindus, with Turkoman tribes in the Oxus plains. Ancient Balkh or Bactriana was a province of the Achaemenian empire. About 250 B.C., Diodotus (Theodotus), governor of Bactria under the Seleucidae, declared his independence and commenced the history of the Graeco-Bactrian dynasties, which succumbed to Parthian and nomadic movements about 126 B.C. Traces of the Buddhist era which succeeded remain in the rock-cut topes of Haibak. Devastated by Jenghiz Khan, it belonged to the Delhi empire for about a century, and then fell into Uzbeg hands. In the 18th century its khanates—Kundaz, Tashkurgan, Balkh with Akcha, and the four western khanates, or "Chahar Vilayet" of Saripul, Shibarghan, Andkhui and Maimana—formed part of the dominion of Ahmed Khan Durani, and so remained under his son Timur, but relapsed on Timur's death to the independent rule of various Uzbeg chiefs, dominated by Bukhara. Between 1850 and 1859 Amir Dost Muhammad re-established Afghan influence, but sovereignty over the Chahar Vilayet was disputed by Bukhara until settled in favour of Afghanistan by the Anglo-Russian Agreement of 1859.

Under the strong rule of Abdur Rahman these territories were more closely welded to Kabul, some relaxation of authority under Amir Habibullah having been made good by King Amanullah, who in 1927, together with his queen, visited Maimana, Mazar-i-Sharif, Tashkurgan and Kataghan, and by royal decree gave the district the name of the Mazar Province. In 1926, a dispute between Russia and Afghanistan regarding Urta Tagai, an island in the Oxus, was settled in favour of Afghanistan. A motor road and telegraph line linking the Mazar Province to Kabul were under construction in 1928. There are aerodromes, on the main Kabul-Tashkent air route, at Mazar-i-Sharif and Haibak. Half of Mazar-i-Sharif was destroyed by fire in June 1927. The Province is administered by a governor directly responsible to the Central Government. Schemes for the extension of cotton cultivation are under consideration. Mazar-i-Sharif is an important centre of the trade in astrakhan and furs.

TURKMEN REPUBLIC, an administrative division of Asiatic Russia, created in 1924. Area 491,216 sq.km. Pop. (1926) 237,570. Boundaries, the Caspian Sea to the west, Persia and Afghanistan to the south, the Uzbek S.S.R. to the east and Kazakstan, with the Kara-Kalpak Autonomous Area to the north. The oasis of Khiva, incorporated in the Uzbek S.S.R. forms an island of separate territory in the north-east.

The changes in the course of the Jaxartes (Syr-darya) and the Oxus (Amu-darya), and the supposed periodical disappearance of Lake Aral, are problems in geography and it is here that we must look for a clue to the physical changes which transformed the Euro-Asiatic Mediterranean—the Aral-Caspian and Pontic basin—into a series of separate seas, and desiccated them,

powerfully influencing the distribution of flora and fauna, and centuries ago compelling the inhabitants of Western and Central Asia to enter upon their great migrations.

A mountain chain, comparable in length to the Alps, separates the deserts of the Transcaspian from the highlands of Khorasan. It begins in the Krasnovodsk peninsula of the Caspian, under the names of Kuryanyn-kary and Great Balkans, whose masses of granite and other crystalline rock reach an altitude of some 5,350 ft. Farther south-east they are continued in the Little Balkans (2,000 ft.) and the Kopepet-dagh or Kopet-dagh. The latter rises steep and rugged above the flat deserts over a stretch of 600 m. In structure it is homologous with the Caucasus chain; it appears as an outer wall of the Khorasan plateau, and is separated from it by a broad valley, which, like the Rion and Kura valley of Transcaucasia, is drained by two rivers flowing in opposite directions—the Atrek, which flows north-west into the Caspian, and the Keshef-rud, which flows to the south-east and is a tributary of the Murghab. On the other side of this valley the Alla-dagh (Aladagh) and the Binalund border-ranges (9,000 to 11,000 ft.) fringe the edge of the Khorasan plateau. Descending towards the steppe with steep stony slopes, the mountain barrier of the Kopet-dagh rises to heights of 6,000–9,000 ft. to the east of Kyzyl-arvat, while the passes which lead from the Turkmen deserts to the valleys of Khorasan are seldom as low as 3,500, and usually rise to 5,000, 6,000 and even 8,500 ft.

While the Alla-dagh and Binalund border-ranges are chiefly composed of crystalline rocks and metamorphic slates, overlain by Devonian deposits, a series of more recent formations—Upper and Lower Cretaceous and Miocene—crops out in the outer wall of the Kopet-dagh. The mountains of Asia which stretch towards the north-west continued to be uplifted at a geologically recent epoch. Quarternary deposits have an extensive development on its slopes, and its foothills are bordered by a girdle of loess.

The loess terrace, called Atok ("mountain base"), 10 to 20 m. in width, is very fertile; but it will produce nothing without irrigation, and the streams flowing from the Kopet-dagh are few and scanty. The winds which impinge upon the northern slope of the mountains have been deprived of all their moisture in crossing the Kara-kum—the Black Sands of the Turkmen desert; and even such rain as falls on the Kopet-dagh (10½ in. at Kyzyl-arvat) too often reaches the soil in the shape of light showers which do not penetrate it. Where the mountain streams run closer to one another, as at Geok-tepe, Ashkhabad, Lutfabad and Kaaka, the villages are more populous, and the houses are surrounded by gardens, nourished by irrigation.

North of this narrow strip of irrigated land begins the desert—the Kara-kum—which extends from the mountains of Khorasan to Lake Aral and the plateau of Ust-Urt, and from the Caspian to the Amu-darya, interrupted only by the oases of Merv and Tejeñ. But the terrible shifting sands, blown into *barkhans,* or elongated hills, sometimes 50 and 60 ft. in height, are accumulated chiefly in the west, where the country has more recently emerged from the sea. Farther east the barkhans are more stable.

The saksaul (*Anabasis ammodendron*) of the Kara-kum has been almost destroyed within the last hundred years, and occurs only sporadically, but the borders of the spaces covered with saline clay are brightened by forests of tamarisk, which are inhabited by great numbers of the desert warbler (*Atraphornis aralensis*)—a typical inhabitant of the sands—sparrows and ground-choughs (*Podoces*); the *Houbara macqueeni,* is characteristic of the region. Hares and foxes, jackals and wolves, marmots, moles, hedgehogs and one species of marten live in the steppe.

The Uzboi.—A feature distinctive of the Turkmen desert is the very numerous *shors,* or elongated depressions, the lower portion of which are mostly occupied with moist sand. They are obviously the relics of brackish lakes, and, like the lakes of the Kirghiz steppes, they often follow one another in quick succession, thus closely resembling river-beds. As the direction of the *shors* is generally from the higher terraces drained by the Amu-darya towards the lowlands of the Caspian, they led to the idea that the Amu-darya once flowed across the Turkmen desert towards what is now the Caspian sea. It was assumed, not only that that river (*see* Oxus) flowed into the Caspian, but that a having ceased to do so in the 7th century, its waters were a diverted to the Caspian about 1221. A chain of similar de sions was traced from Urgenj to the gap between the Great the Little Balkans; this was marked on the maps as the U or old bed of the Oxus. The idea of again diverting the Amu the Caspian was thus set afloat, but the investigations of Rus engineers, especially A. E. Hedroitz, A. M. Konshin, I. V. M ketov, P. M. Lessar and Svintsov[1], went to show that the Uzb no river-bed at all, and that no river has ever discharged its wa in that direction. The existence of an extensive lacustrine de sion, now represented by the small Sary-kamysh lakes, was pro and it was evident that this depression, having a length of than 130 m., a width of 70 m., and a depth of 280 ft. below present level of Lake Aral, would have to be filled by the before its waters could advance farther to the south-west.

The ancient texts (of Pliny, Strabo, Ptolemy) about the artes and Oxus only become intelligible when it is admitted since the epoch to which they relate, the outlines of the Cas Sea and Lake Aral have undergone notable changes, commensu with those which are supposed to have occurred in the cou of the Central Asian rivers. The desiccation of the Aral-Cas basin proceeded with such rapidity that the shores of the Cas cannot possibly have maintained for some twenty centuries outlines which they exhibit at present. The general configura of the Trans-Caspian region leaves no doubt that both the Jax and the Oxus, with its former tributaries, the Murghab and Tejeñ, once flowed towards the west; but the Caspian of time was not the sea of our days; its gulfs penetrated the Turk steppe, and washed the base of the Ust-Urt plateau. (*See* Cas and Aral.)

Climate, etc.—The region between the Heri-rud and Murghab is a plateau, 2,000 ft. above the sea, with hills 500 600 ft. high covered with sand, the spaces between being f with loess. The Borkhut Mountains which connect the Kopet-d with the Sefid-kuh in Afghanistan reach 3,000 to 4,000 ft., are cleft by the Heri-rud. Thickets of poplar and willow acc pany both the Murghab and the Heri-rud. Pistachio and mulb trees grow in isolated clumps on the hills; but there are few pl available for cultivation. The climate is continental and the m mum temperature in the shade in summer varies between 43 at Tejend and 46° C at Serakhs. The average summer temp ture varies between 29° C and 32° C and winter between 0 at Merv and 3° C at Termez. The rainfall is insignificant falls in December, January and February, summer being rai and sultry. Thus cultivation depends entirely on irrigation.

Agriculture, etc.—The years of civil war and disorder lowing 1917 resulted in a sharp drop in the amount of cultiv land; irrigation canals were not cleaned or repaired and fa was widespread. As a result the number of cattle, especially sh was disastrously diminished, partly through slaughter and pa because herdsmen migrated into Persia and Afghanistan with t flocks. After the restoration of somewhat more settled condit a complete revolution in social system was enforced, the tribal holding of water rights was abolished and a new syste government control and distribution of water supply and of fe land introduced. This involves much difficulty for the illite tribesmen and conditions are far from stable, though there been a marked improvement during 1926–8, especially in cot growing, to which the Soviet government attaches much im tance. The grain and wheat crop is insufficient for the need the people and 75,000 tons were imported in 1926–7. The M oasis (*q.v.*) is reviving and an electric plant and new irriga works have been constructed. Watermelons, fruits and vines cultivated and silkworm breeding is an ancient occupation, e cially round Merv and Ashkabad. In former times the silk worked entirely as a peasant industry, but in 1927–8 a fac was under construction for large scale silk manufacture.

Peasant industries include the making of homespun and felt

[1]Their original papers are printed in the *Izvestia* of the Ru Geographical Society, 1883 to 1887, also in the *Journal* of the Ru ministry of roads and communications.

needs, the making of primitive agricultural implements and hold goods, and the preparation of leather and silk goods. et weaving is an ancient peasant industry for export, and each has its own design, guarded as a secret from other tribes. utting off of income from carpet making during the civil war , disaster. Horses, camels, working cattle, sheep (especially ul), goats, asses and mules are bred. Their numbers are below 1913 level, and sheep particularly have diminished.

nerals.—Salt, Glauber's salt, ozokerite and naphtha exist. -1914 times the output of salt was about 58,000 tons; during ivil war production ceased, but by 1926–7 it had risen to o tons. Ozokerite production in that year surpassed the ous level, reaching 700 tons as against 450 tons. The naphtha e Ashkabad district is little exploited as yet, but that on ken Island, which is obtained from natural fountains yields average 154,000 tons per annum. Rock salt is exported to caucasia, Persia and Afghanistan, while Glauber's salt from ara-bugaz Gulf is increasingly worked, and plans are under leration for developing a superphosphate manure industry e region. Vast resources of sulphur exist in the Kara-Kum north of Ashkabad, but their exploitation in a waterless seems impossible at present and Russia depends on imported ur. The chief town and administrative centre is Ashkabad, opulation of which increased from 13,737 in 1897 to 47,155 26, during which period the population of Krasnovodsk on aspian rose from 6,322 to 10,022 and of Merv from 8,533 to 9, the latter town has grown rapidly since the construction electric power plant.

lustries.—Factory industries include cotton and wool clean- lass manufacture, flour-milling, brewing and distilling; the ration of dried fruit is increasing. Krasnovodsk on the an is the port for the republic, its chief exports being cotton ried fruits and its imports naphtha, timber, grain and sugar. g the civil war dredging operations ceased and the town has quently suffered. A fishing industry exists along the coast, ally near Chikishliar and Hassan-Kuli, but it is still con- bly below the pre-war output of 10,000 tons. The Trans- n railway is the chief means of communication, and there ranch from Merv to Kushka on the southern frontier. The larya is difficult for steam navigation, and camel caravan chief trading link. Caravan routes cross the desert to the of Khiva, to the various stations on the railway, to the f Krasnovodsk and to the towns of North Persia. Much present income of the republic is going towards the pro- of new irrigation canals and the sinking of wells. Its finan- rospects are good in view of its trade with Persia and nistan and the development of its mineral resources. The y rate is the lowest in the U.S.S.R., averaging 4·2% among nd 0·2% among women.

ulation.—The population consists of Turkmens 70·2%, s 11·7%, Russians, Ukranians and White Russians (chiefly ns) 9·1%, Armenians 1%, Kirghiz 0·7%, with a few Per- nd Bokhara Jews. About half of the Turkmen tribes live republic, the rest being found in Persia and Afghanistan. ien tribes seem to have been settled in the steppe between us (Amu-darya) and the Caspian from time immemorial e of the west-central Turkish group. They are mentioned b writers of the 10th century and were noted even at that s much feared by their neighbours owing to their warlike tion. Up to the time of the defeat of the Tekke tribe at epe in 1881 by the Russians, they preserved their nomadic ory life, frequently holding Russian and Persian captives som, and were perpetually engaged in tribal warfare. Since ssian conquest many have taken to settled life, though semi-nomadism and some pure nomadism still exists. The tribe, which formerly wandered in the steppe to the south- f the Caspian, is now mainly occupied at the naphtha in Cheleken Island, while other Yamuts settled as agri- lists in Khiva in the early 19th century. The Tekkes, who ne most important tribe at the time of the Russian occu- (1881) are much scattered; many have become settled tors. In early times they inhabited the Mangishlak penin- sula, but were driven out by the Kalmucks in 1718. Later they occupied the Akkal and Merv oases. The most ancient tribe was the Salors, who occupied the western corner of the Paro- pamisus range, and with whom the Arabs came in contact on their march towards the Oxus in the 7th century. Intertribal strife, and emigration to the oases and to Persia have much reduced their numbers. The Ersaris, formerly a warlike tribe of the Mangyshlak peninsula were driven by the Uzbeks to the steppe south of the Ust-Urt plateau, and have lately settled as peaceful cultivators on the left bank of the Oxus. The building of the Transcaspian railway further altered their habits, as did the intro- duction of naphtha and salt working. Up to the October 1917 revolution they preserved their tribes and clans, and, though these will not disappear at once, the confiscation of water and property from the chieftains drove a sharp wedge into traditional custom and must lead to tribal disintegration. For the history of the oasis of Merv, which capitulated to the Russians in 1883 *see* MERV.

Arkhipov, *Central Asiatic Republics*, 1927 (in Russian, with a bibliography).

TURKOMANS, a group of the Iranian Turks, found in Persia, Khiva, Bokhara, in the Caucasus, and in Transcaspia, and probably numbering about 1,000,000. They include the following clans, Chaudor, Yomut, Goklan, Akhal, Merv Tekkes, Sarik, Salor, and Ersari. The clan divisions are endogamous, and owing to the scarcity of women a high bride price is paid, and many of the men are unmarried. A large number of the Turkomans are nomadic horse-breeders, although some have become agriculturists. All of them are Muslims. Some of the Turkomans of the steppes appear to preserve the old Proto-Nordic physical type, but in most places they have absorbed the physical type and much of the culture of the people amongst whom they live. (*See* TURKS, and CENTRAL ASIA: *Ethnology.*) (L. H. D. B.)

TURKS. The term Turk is purely linguistic and refers to those peoples who speak Turkic languages, having no racial sense. The Turks may be divided into two groups: a western, which includes the Osmanli, the Turks of what was formerly "Turkey in Europe and Turkey in Asia," the old Ottoman empire, and the eastern Turks, including many of the peoples of Turkistan and Central Asia, as far as the river Lena. There are also Turks in the Crimea, in the Caucasus, and along the Volga. The latter are culturally entirely associated with the eastern Europeans, as are the Osmanli with the south-eastern Europeans and western Asiatics, but linguistically they are associated with the western Turks. (For racial history *see* ASIA: *Central,* and *South-western.*) The eastern Turks include the Turks of Turkistan and the Caspian steppes, who have become largely absorbed culturally and physically in the Iranian peoples, and may be conveniently called Iranian Turks, and the Turanian Turks, many of whom are called Tatars (this rather than the more familiar "Tartar" is the more correct spelling), of the Steppes, of southern Siberia, Dzungaria and northern Mongolia. The Iranian Turks include the Turkomans, the Sarts, the Taranchi or Ili Tatars, the Uzbegs, the Kaizak and the Kara Kalpak. The Turanian Turks include the Khirghiz, a somewhat loose term, the Yakut and the Siberian Tatars.

The social organization of the Turks is based on a patriarchal system of sub-clans, all related by blood, and these sub-clans are gathered together in a loose confederacy of the clan (sok).

There is no definite mode of life which can be associated with the Turks as a whole; the western Turks and most of the Iranian Turks are sedentary agriculturalists, while those eastern Turks who have been most subject to migrations and live under steppe conditions have adopted the horse culture found in its most typical form among the Mongols (*q.v.*), while the Yakuts practise the reindeer culture of eastern Asia.

The western Turks are Muslims, but to the east, in spite of the superimposition of higher religions, including formerly Nestorian Christianity, which at one time was a serious rival of Islam, much

of the animistic old religions remain, and shamanism is a specially important feature among the eastern and northern tribes.

It is almost impossible to make any generalized statement about the Turks; their most potent bond is that of language; they have no uniform culture, no uniform religion or physique, and even the features of some of the ceremonies of the Kirghiz, considered by Czaplicka to be one of the purest of Turkic tribes, are almost exactly similar to those of the Mongols. Ethnologically, therefore, they must be referred to the regions in which they l've.

HISTORY

The discovery near the river Orkhon, to the south of Lake Baikal, of Turkish inscriptions dating from the 8th century A.D., and the publication of materials furnished by Chinese writers, has stimulated interest in the history of the Turkish movements in Asia.

Early Period.—From 1400 B.C. onwards, but especially about 200 B.C., Chinese history contains notices of warlike nomads called Hiung-nu or Hsiung-nu. Their political power broke up in the early centuries of this era before the advance of the Sien-pi and Tobas, who appear to have been Tunguses, and from whom arose the Wei dynasty of northern China. In A.D. 433 a Hiung-nu clan called Asena or A-shih-na, disliking the rule of the Wei, moved eastwards and sought the protection of a people called Jeu-Jen or Jwen-Jwen, who were also a kind of Hiung-nu. They are the Geougen of Gibbon and others, and their identity with the Avars has been affirmed and disputed with equal confidence. The Asena served the Jwen-Jwen as workers in iron and lived not far from the modern city of Shan-Tan in Kan-suh. In this neighbourhood was a hill called from its shape Türkü, Dürkü or T'u-chüeh, meaning helmet, and this is said to be the origin of the national name which has become so celebrated. The name Tu-Kiue (Tou-Kiue) or Turk is first used by the Chinese in recording the events of A.D. 545, and the following years, when the Turks, or descendants of the Asena, revolted against the Jwen-Jwen. These latter were crushed and disappear from history, at least under that name. The victorious Turks advanced across their territory, came into collision with the Hephthalites or Ephthalites (*q.v.*), whom they defeated, and are heard of on the Oxus (*q.v.*), about A.D. 560. The period 546–582 marks the first brilliant epoch of early Turkish history. The tribes were not divided and made the most astonishing advance under Tumen (who took the title of Ili-Khan), his brother Itsämi or She-ti-mi (perhaps the Stembis of Greek writers), his son Mokan and Istämi's son Tardu or Ta-t'eu. Though fifty years before only a servile clan in China, they sent an embassy in 567 to the East Roman emperor Justin II., as related by Menander Protector (C. Müller: *Fragm. hist. graec.*, vol. iv.). In 598 the khan Tardu wrote to the emperor Maurice, and in 620–28 the Turks assisted Heraclius in his campaigns against Persia. Meanwhile the Turks had themselves split into two divisions with separate princes. A tendency towards division, very natural in so loose and extended a community, had been visible for some time, and the rupture was precipitated in 582 by the jealousy of Ta-lo-pien or Dalobian, who was angry at not being chosen khan. For a century and a half or so we hear of two khanates: the northern Turks, living near Lake Baikal and the southern tributaries of the Yenisei, and the western Turks, who appear to have had two headquarters, one near Urumchi and one near Aulieata, north of Tashkent. But their conquests, or at least their successful raids, extended very much farther to the west and south. In 630 the Chinese pilgrim Yüan Chwang (Hsüan Tsang) was well received by their khan, T'ung-she-ho, who exercised some kind of authority from Turfan to Merv. The Chinese followed a consistent policy of spreading dissension among these dangerous tribes and of supporting the factions that were weak or distant against those that were strong or near. Accordingly they were friendly to the western Turks until they had conquered the northern Turks. This western branch lasted until about 750 as a political name. From about 550 till 650 they were independent, and, as mentioned, allies of the east Roman Empire against the Persians. But about 650 the politics of the Nearer East w transformed by the conquests of the Arabs following on preaching of Mahomet. After subduing Persia in 639 they spr to Transoxiana. At the same time dissension prevailed among western Turks themselves: the five tribes called Nu-she-pi, lived west of Issyk-kul, quarrelled with the five tribes called T living to the east of it. The Chinese fomented the quarrel, an 659 were able to declare that they annexed the whole territor the western Turks, including at least Dzungaria, Tashkent, ghana, Bokhara, Khulm, Badakshan, Ghazni, Bamian, Udy Wakhan and Karateghin. But it would seem that neither Turkish occupation nor the Chinese annexation of most of t countries was effective. From 650 to 750 the possession of t was disputed not only by the Turks and Chinese but by Tibetans in the east and the Arabs in the west. In the west, campaigns of Qotaiba b. Muslim or Kutaiba (705–14) compl the Mohammedan conquest of Transoxiana (*see* CALIPHATE, B § 6).

For the history of the northern Turks our only authorities the Orkhon inscriptions and Chinese writers. The half-cent following on the division was prosperous for the northern as as for the western Turks, and they menaced China; but in the Chinese conquered them. This is the Chinese servitude m tioned in the inscriptions. In 682 Kutluk (also called Elte which seems to be a title) re-established a Turkish state on Orkhon. He was succeeded by his brother Kapagan (or Chuo), who subdued the Turgäsh, or perhaps merely drove t southwards, early in the 8th century, and was succeeded by B Kagan of the inscriptions.

This northern khanate was destroyed by a coalition of the K luk, Uighur and Basmal in 744. These peoples, like the Turg appear to have been Turkish. A succession of these pressed ward from the east. When first heard of, the Karluk inhab the country on the Irtysh and the Urungu, and subsequently o pied Teles and Tokmak. The Uighurs belonged to the group tribes known as Tölös or T'ie-le and established themselves Balasaghun (also known by the forms Kara-Balghasun, K Balgassun and Balagasun: *see* KARAKORUM). This brings us the middle of the 8th century. For the next two hundred y the Turkish element in Central Asia, though it must have b numerous, does not cut any figure in history, which is filled v the chronicles of Arab and Persian dynasties (*see* CALIPHA SAMANIDS), but in the 10th century we begin to hear of it ag Turkish adventurers founded the dynasty of Ghaznevids Ghazni, and there was a Uighur kingdom in the east compri Kashgar and Khotan. Boghra Khan, the ruler of this kingd was converted to Islam at the end of the 10th century, an continued under various branches of Uighurs until 1120. M important politically is the rise of the Seljuks. They were princely family of the Kabaks, who were a section of the gr of tribes called Ghuzz (Oghuz, Οὔζοι), and are heard of in Tra oxiana about 985. Their chieftains Toghrul and Chakir drove Ghaznevids to India and established themselves as protectors the Abbasid caliph, who formally ceded his temporal power them. (For the history of the dynasty *see* SELJUKS.) Alp Ars the son of Chakir, defeated the Byzantines at Manzikert (10 and prepared the way for the Ottoman conquests. His son M Shah ruled over nearly all the modern Turkey in Asia, and far as the frontiers of China. On his death in 1092 his em broke up into several pieces. Konia became the capital of sultanate of Asia Minor and various Seljuk dynasties establis themselves in Kerman, Irak and Syria. A new Turkish po was founded by the khans of Khiva, who are known as Khwarizm-shahs. They were originally vassals of the Selji with the title of tasdar or ewer-bearer, but became independ and conquered Khorasan and Irak. They had, however, to c tend with yet another new arrival from the east, the Kara-Kit These also were probably Turks, and were pushed westwa from China by the Kins. They conquered Kashgar, Kho Yarkand and later Transoxiana, pushing the Ghuzz tribes bef them into Persia and Afghanistan. Their prince bore the t of *gur-khan*, and the Khwarizm shahs did homage to him

, when they unsuccessfully revolted. But all these squab- principalities were swept away in 1219 by the extraordinary of invasion which surged across Asia to Europe under hiz Khan (*q.v.*). After the death of Jenghiz his conquests divided, and Transoxiana, Kashgar, Badakshan, Balkh and ni were given to his second son Chagatai or Jagatai. Jenghiz his family must have been Mongols, but the name Jagatai d to the population and language of the countries about the . In 1321 the Jagatai khanate split into two khanates, Trans- a and Dzungaria, and in 1370 collapsed before Timur. This conqueror (1333–1404), who like Jenghiz had an extraordi- power of collecting and leading the hordes of Central Asia, native of the district of Samarkand and a Turk by descent. conquered successively Dzungaria (1370), Persia and the asus (1390), the Kipchaks on the Volga (1395), and North- ndia (1398). He then invaded Syria and Asia Minor, where feated but did not annihilate the Osmanlis. The house of r did not retain his more distant conquests, but they ruled markand until 1499 with the usual struggles between different hes of the family. Their possessions included, at least from to time, the northern parts of Afghanistan and Persia, as as Transoxiana and Turkestan. They were one of the most ntened and cultivated of Turkish dynasties. They beautified ities of Central Asia and were patrons of literature. The ry languages were as a rule Arabic or Persian; Turkish was more rarely and chiefly for poetry.

e Timurids were overthrown and succeeded by the Shaibani sty, a branch of the house of Juji, Jenghiz Khan's eldest to whom his father had assigned dominions in the region of the kingdom of Jagatai. About 1465 a number of this migrated into the Jagatai khanate. They were given terri- on the Chu River and were known as Uzbegs. About 1500 chief, Mahommed Shaibani or Shahi Beg, made himself r of Transoxiana and founded the Uzbeg power. The chief ent of the Uzbegs in their early days was Babér, who repre- d the house of Timur in the fifth generation, but he ulti- y led his armies in another direction and invaded India), where he founded the Mogul Empire, a far more impor- tate than the principalities of the Oxus.

e Osmanlis, or house of Osman, the founders of the present sh Empire, appear to have been a clan similar to the early s or the present Turkomans of Transcaspia, who migrated sia Minor from Khorasan and made the neighbourhood of their headquarters. Their conspicuous position in history inly due to the fact that they attained pre-eminence very nd in districts very near Europe. Except for the invasion nur they did not suffer from the attacks of other Turks and were able to concentrate their strength on the conquest of crepit Byzantine Empire. *See* TURKEY.

RKS AND CAICOS ISLANDS, a group in the British Indies, belonging geographically to the Bahamas. They coral and sand formation: combined area 169 sq.m. The Islands, so named from the cactus resembling a turban, ne in number; Grand Turk (10 sq.m.) and Salt Cay (5½ are the largest. The town of Grand Turk is the seat of ment and a port of registry. Salt Cay has a good harbour. aicos Islands lie north-west of Turks Islands and are seven ber. Cockburn Harbour on South Caicos, 22 m. from Grand is a port of entry. The climate is healthy. Drinking water ce, the rainfall being only 27½ in. The mean temperature F, but owing to the sea breezes the climate is not sive. Hurricanes are not infrequent. Salt raking is the industry. Sisal hemp is grown and some cotton. Sponges ntiful and there are four curing factories. The exports, to the United States, include salt, sponges and sisal hemp. Turk has a cable to Bermuda, Kingston and Jamaica, some to the S.W. The islands were uninhabited when, about he Bermudians began to visit them to rake salt. In 1710 itish were expelled by the Spaniards, but they returned e salt trade (largely with America) continued despite by Spaniards and French, and counter-claims by the authorities at the Bahamas, who about 1765 made good their claim. In 1799 the islands were given representation in the Bahamas Assembly, but in 1848, on the petition of the inhabitants they were made a separate colony under Jamaica, to which island, in 1873, they were annexed. They are governed by a commissioner assisted by a nominated legislative board. Population (est. 1925) 5,500; 200 white, the rest negro or mulatto; about 1,570 live in Grand Turk.

See the *Jamaica Handbook* (London, yearly) and Sir C. P. Lucas, *Historical Geography of the British Colonies,* vol. ii. (2nd ed., Oxford, 1905).

TURKU, formerly ABO, a seaport of Finland on the Gulf of Bothnia. Pop. (1925) 61,031. It is the second largest town in Finland, and has a shipbuilding and repairing industry. An ice-breaker keeps the port open throughout the winter. There are four entrances to the harbour, with lighthouses for each, and there are four patent slips capable of taking vessels up to 1,200 tons. The chief imports are salt, salt-fish, pig-iron, oils, coal, cotton, machinery and colonial goods and the exports timber, grain, butter, bar-iron, pork, beef and game. There is a considerable coasting trade. When the Estates of Finland seceded from Sweden and accepted the Emperor of Russia as their grand duke at the Diet of Borgå in 1809, Turku became the capital of the new state, but in 1819 the government was moved to Helsinki. In June 1929 it celebrated its 700th anniversary.

TURKU-PORI (ÄBO-BJÖRNEBORG), a department in the south-west of the republic of Finland. Area (in English square miles), 8,934. Pop. (1925), 512,013. It is a lowland region containing much boulder-clay soil and a consequent imperfect drainage. The department, together with most of Finland, has not yet recovered from the effects of severe glaciation. Finnish and Swedish are spoken by the inhabitants. The chief towns are Turku (Abo), pop. (1925), 61,031; and Pori (Björneborg), 17,456.

TURMERIC, the tuberous rhizomes of *Curcuma longa,* an herbaceous perennial plant belonging to the family Zingiberaceae. It is a native of southern Asia, being cultivated on a large scale both on the mainland and in the islands of the Indian Ocean. Turmeric has been used from a remote period both as a condiment and as a dyestuff, and was once employed to a more limited extent as a medicine. In Europe it is employed chiefly as a dye, also as an ingredient in curry powder and as a chemical test for alkalies. The root (rhizome) is prepared by cleaning it and drying it in an oven. There are several varieties (Madras, Bengal, Gopalpur, Java, China and Cochin turmeric), differing chiefly in size and colour of the tubers and to a slight degree in flavour. All are hard and tough, but break with a short resinous or waxy fracture; the exposed surface varies in tint from an orange brown to a deep reddish brown. The colour is due to *curcumin,* $C_{21}H_{20}O_6$, of which the drug contains about 0·3%. When pure it forms yellow crystals having a vanilla odour and exhibiting a fine blue colour in reflected light. On oxidation with potassium permanganate it gives vanillin, the flavouring and odorous material of vanilla (*q.v.*). It is soluble in alcohol, in chloroform, but only sparingly in water. Paper tinged with a tincture of turmeric exhibits on the addition of an alkali a reddish brown tint, which becomes violet on drying, a test for alkalinity discovered by H. A. Vogel in 1815.

TURNEBUS, ADRIANUS [ADRIEN TURNEBE] (1512–1565), French classical scholar, was born at Les Andelys in Normandy, and at the age of 12 was sent to Paris to study. After having held the post of professor of belles-lettres in the University of Toulouse, in 1547 he returned to Paris as professor (or royal reader) of Greek at the Collège Royal. In 1552 he was entrusted with the printing of the Greek books at the royal press, in which he was assisted by his friend, Guillaume Morel (*q.v.*). He died of consumption on June 12, 1565. His works chiefly consist of philological dissertations, commentaries (on Aeschylus, Sophocles, Theophrastus, Philo and portions of Cicero), and translations of Greek authors into Latin and French. His son, Etienne, published his complete works, in three volumes (Strasbourg, 1600), and his son Adrien his *Adversaria,* containing explanations and emendations of numerous passages in classical authors.

See *Oratio funebris* by Léger du Chesne (Leodegarius a Quercu) prefixed to the Strasbourg edition; L. Clément, *De Adriani Turnebi praefationibus et poematis* (1899); J. E. Sandys, *History of Classical Scholarship* (1908) iii.

TURNER, CHARLES (1774–1857), English engraver, was born at Woodstock on Aug. 31, 1774. He entered the schools of the Royal Academy in 1795; and, engraving in stipple in the manner of Bartolozzi, he was employed by Alderman Boydell. His finest plates, however, are in mezzotint, a method in which he engraved J. M. W. Turner's "Wreck" and 24 subjects of his *Liber studiorum*, Reynolds's "Marlborough Family," and many of Raeburn's best portraits, including those of Sir Walter Scott, Lord Newton, Dr. Hamilton, Professors Dugald Stewart and John Robinson, and Dr. Adam. He also worked after Lawrence, Shee and Owen. He was an admirable engraver, large, broad and masterly in touch. He died on Aug. 1, 1857.

TURNER, FREDERICK JACKSON (1861–), American historian, was born at Portage, Wis., on Nov. 14, 1861, and educated at the University of Wisconsin (A.B., 1884; A.M., 1888) and Johns Hopkins (Ph.D., 1890). He was assistant professor, 1889–91 and professor, 1892–1910, of American history at the University of Wisconsin. From 1910 to 1924 he was professor of history at Harvard, and afterwards professor emeritus. In 1927 he went to San Gabriel, Calif., to assume direction of research in the *Americana* of the large Henry E. Huntington library. His publications are few but they have been of great importance in their influence upon the interpretation and the writing of American history. In his essay "The Significance of the Frontier in American History," first published in the *Report of the American Historical Association* for 1893, he set forth the thesis that the frontier was up to that date the most influential factor in American history and in the development of a distinctly national character. Various other essays collected in *The Frontier in American History* (1921) amplify various phases of his thought and illustrate it by type studies. His viewpoint was also illustrated in his excellent study *The Rise of the New West* (1906) in the American nation series. Turner's students are numerous among American history teachers and writers of mid-west universities and historical societies, and through their agency, perhaps more than through his writings, his ideas have been made vital in American historiography.

TURNER, JOSEPH MALLORD WILLIAM (1775–1851), English painter, was born in London on April 23, 1775. His father, William Turner, a native of Devonshire, kept a barber's shop at 26 Maiden Lane, Covent Garden. His mother died insane. The earliest known drawing by Turner, a view of Margate Church, dates from his ninth year. His father taught him to read, and this and a few months at a school at New Brentford and afterwards at Margate were all the schooling he ever had; he never mastered his native tongue. Yet, one of his strongest characteristics was a taste for associating his works with personages and places of legendary and historical interest.

Early Training.—By the time Turner was thirteen he had chosen an artist's career. In 1788–89 he was receiving lessons from Palice, "a floral drawing master;" from T. Malton, a perspective draughtsman; and from Hardwick, an architect. He also attended Paul Sandby's drawing school in St. Martin's Lane. Part of his time was employed in making drawings at home, which he exhibited for sale in his father's shop window, two or three shillings being the usual price. He coloured prints for engravers, washed in backgrounds for architects, went out sketching with Girtin, and made drawings in the evenings for Dr. Munro "for half a crown and his supper." In 1789 Turner became a student of the Royal Academy. He also worked for a short time in the house of Sir Joshua Reynolds. In 1790 he exhibited for the first time at the Royal Academy, a "View of the Archbishop's Palace, Lambeth." About 1792 he received a commission from Walker, the engraver, to make drawings for his *Copper-Plate Magazine*, and this topographical work took him to many interesting places. A year or two after he accepted a similar commission for the *Pocket Magazine*, and before his twentieth year he had travelled over many parts of England and Wales. None of these magazine drawings is remarkable for originality or for artistic feelin

Until 1792 Turner's practice had been almost exclusively water colour, and his early works show how much he was debted to some of his contemporaries, such as J. R. Cozens. H first exhibited oil picture appeared in the Academy in 1793. 1794–95 Canterbury Cathedral, Malvern Abbey, Tintern Abbe Lincoln and Peterborough Cathedrals, Shrewsbury, and Kin College Chapel, Cambridge, were among the subjects exhibite and during the next four years he contributed no less than thirt nine works to the Academy. In the catalogue of 1798 he fi began to add poetic quotations to the titles of his pictures, showi that his mind was now occupied with something more than t merely topographical element of landscape, Milton's *Parad Lost* and Thomson's *Seasons* being laid under frequent contrib tion for descriptions of sunrise, sunset, twilight or thunderstor Turner's first visit to Yorkshire took place in 1797. It seems have braced his powers and possibly helped to change the stude into the painter. Until then he was little more than a painstaki and tolerably accurate topographer; but even under these con tions he had begun to attract the notice of his brother artists a of the critics. The only formidable rivals Turner had to conte with were De Loutherbourg and Girtin, and after the death the latter in 1802 he was left undisputed master of the field.

(1799–1804).—In 1799 he was elected A.R.A. (age 24), and 1800 had moved to Harley Street. He was elected R.A. in 18 He enjoyed the dignity of Academician for nearly half a centu and he took an active share in the direction of the Academ affairs. His speeches are described as "confused, tedious, obscu and extremely difficult to follow"; but at council meetings he v ever anxious to allay anger. His opinions on art were alwa listened to with respect; but on matters of business it was of difficult to know what he meant. His friend Chantrey used to s "He has great thoughts, if only he could express them." Wh appointed professor of perspective to the Royal Academy in 18 this painful lack of expression stood greatly in the way of his u fulness. Ruskin says, "The zealous care with which Tur endeavoured to do his duty is proved by a series of large drawin exquisitely tinted, of the most difficult perspective subjects, ill trating not only directions of line, but effects of light, with a c and completion which would put the work of any ordin teacher to utter shame." With his election to the associateship the Academy Turner's early struggles may be considered to h ended. He abandoned topographical fidelity and began to pa his dreams, the visionary faculty—the true foundation of his ar asserting itself, nature being used to supply suggestions a materials. His work is described by Ruskin as "stern in m ner, reserved, quiet, grave in colour, forceful in hand."

Turner's visit to Yorkshire in 1797 was followed a year or t later by a second, when he made the acquaintance, which af wards ripened into a long and staunch friendship, of Fawkes Farnley Hall. From 1803 till 1820 Turner was a frequent visi at Farnley. The large number of his drawings still preser there—English, Swiss, German and Italian, the studies of roo outhouses, porches, gateways, of birds shot while he was th and of old places in the neighbourhood—prove the frequency his visits and his affection for the place. Turner visited Scotl in 1800, and in 1801 or 1802 he made his first tour on the C tinent. In the following year, of the seven pictures he exhibi six were of foreign subjects, among them "Bonneville," "The F tival upon the Opening of the Vintage of Mâcon," and the w known "Calais Pier" in the National Gallery. The last-named ture, although heavily painted and somewhat opaque in colour magnificently composed and full of energy. In 1802 he took father, who still carried on the barber business in Maiden Lane live with him. Turner was never the same man after his fath death in 1830, when he lived a solitary life.

The Liber Studiorum.—In 1804 Turner made a second on the Continent, and in the following year painted the "Sh wreck" and "Fishing Boats in a Squall" (in the Ellesmere col tion), seemingly in direct rivalry of Vandervelde, in 1806 "Goddess of Discord in the Garden of the Hesperides" (in riva of Poussin), and in 1807 the "Sun rising through Vapour"

of Claude). The last two are notable works, especially the
" In after years it was one of the works he left to the
on the special condition of its being hung beside the
es in the National Gallery. In this same year (1807)
commenced his most serious rivalry. Possibly it arose out
esire to break down Claude worship—the then prevailing
n—and to show the public that there was a living artist not
thy of taking rank beside him. That the *Liber studiorum*
ggested by the *Liber veritatis* of Claude, and was intended
irect challenge to that master, is beyond doubt. There is,
er, a certain degree of unfairness to Claude in the way in
the challenge was given. Claude made drawings in brown of
tures as they left the easel, not for publication, but merely
re as private memoranda. Turner's *Liber* drawings had no
urpose, but were intended as a direct appeal to the public
ge between the two artists. The first of the *Liber* drawings
ade in the autumn of 1806, the others at intervals till about
They are of the same size as the plates and carefully
d in sepia. He left over fifty of these to the National
y. The issue of the *Liber* began in 1807 and continued at
ar intervals till 1819, when it stopped at the fourteenth
r. Turner had resolved to manage the publishing business
f, but in this he was not very successful. He soon quar-
with his engraver, F. C. Lewis, on the ground that he had
his charges from five guineas a plate to eight. He then
ved Charles Turner, who agreed to do fifty plates at the
sum, but, after finishing twenty, he too wished to raise his
and, as a matter of course, this led to another quarrel.
lds, Dunkarton, Lupton, Say, Dawe and other engravers
fterwards employed—Turner himself etching and mezzo-
some of the plates.

n part of the *Liber* contained five plates, the subjects,
d into "historical," "pastoral," "marine," etc., embracing
ole range of landscape art. Seventy-one plates in all out of
ndred were published (including one as a gift of the artist
subscribers); ten other plates—more or less completed—
ed for the fifteenth and sixteenth numbers were never pub-
the work being stopped for want of encouragement. The
of the plates is unequal; some—for example, "Solway
" "Inverary Pier," "Hind Head Hill," "Ben Arthur," "Riz-
'Junction of the Severn and Wye" and "Peat Bog"—are of
eauty, while a few are comparatively tame and uninterest-
mong the unpublished plates "Stonehenge at Daybreak,"
Stork and Aqueduct," "The Via Mala," "Crowhurst," and
light off the Needles" take a high place. The *Liber* shows
traces of the influence of Cozens and Girtin, and, as a
of course, of Claude. A good deal has been written about
's intention, and the "lessons" of the *Liber studiorum*.
ly his only intention in the beginning was to show what he
do, to display his art, to rival Claude, perhaps to educate
taste, and at the same time make money. Already in this
re seen strong indications of one of his most remarkable
eristics—a knowledge of the principles of structure in
objects; mountains and rocks are drawn, not with topo-
al accuracy, but with what appears like an intuitive feeling
logical formation; and trees have also the same expression
and growth in the drawing of stems and branches. This
tive feeling in Turner for the principles of organic structure
ribed in the fourth volume of *Modern Painters*.

rious example of the *reasonableness* accompanying his
e of the imaginative faculty is to be found in his creations
tures he had never seen, as, for example, the dragon in the
n of the Hesperides" and the python in the "Apollo," ex-
in 1811. Both these monsters are imagined with such
ss and reality, and the sense of power and movement is so
tely expressed, that the spectator never once thinks of them
rwise than representations of actual facts in natural history.
s further aided by a memory of the most retentive kind.
illustration of this may be seen at Farnley Hall in a draw-
a "Man-of-War taking in Stores." Some one, who had
seen a first-rate, expressed a wish to know what it looked
Turner took a blank sheet of paper, outlined the ship, and
finished the drawing in three hours.

From 1813 till 1826, in addition to his Harley Street residence, Turner had a country house at Twickenham. He kept a boat on the river, also a pony and gig, in which he used to drive about the neighbouring country on sketching expeditions. The pony, for which Turner had a great love, appears in his well-known "Frosty Morning" in the National Gallery. In 1813 Turner commenced the series of drawings, forty in number, for Cooke's *Southern Coast*. This work was not completed till 1826. The price he at first received for these drawings was £7, 10s. each, afterwards raised to £13, 2s. 6d.

"Crossing the Brook" appeared in the Academy of 1815. It marks the transition from his earlier style to that of his maturity. It represents a piece of Devonshire scenery, a view on the river Tamar. In design and execution this work is founded upon Claude. The colour scheme is limited to greys and quiet greens for the earth and pale blues for the sky. It is a sober but very admirable picture, full of diffused daylight. "Dido Building Carthage" also belongs to this period. It hangs beside the Claudes in the National Gallery. Towering masses of Claudesque architecture piled up on either side, porticoes, vestibules, and stone pines, with the sun in a yellow sky, show the Carthage imagined.

Middle Period.—In 1818 Turner was in Scotland making drawings for the *Provincial Antiquities*, for which Sir Walter Scott supplied the letterpress, and in 1819 he visited Italy for the first time. From this time his works became remarkable for their colour. Hitherto he had painted in browns, greys and blues, using red and yellow sparingly. He had gradually been advancing from the sober grey colouring of Vandervelde and Ruysdael to the mellow and richer tones of Claude. His works now begin to show a heightened scale of colour, gradually increasing in richness and splendour and reaching its culminating point in such works as "Ulysses," "Childe Harold's Pilgrimage," "The Golden Bough," and "The Fighting Téméraire." All these works belong to the middle period of Turner's art (1829–1839), when his powers were entirely developed. Much of his most beautiful work at this period is to be found in his water-colour drawings: those executed for Whitaker's *History of Richmondshire* (1819–1821), for Cooke's *Southern Coast* (1814–26), for *The Rivers of England* (1824), for *England and Wales* (1829–38), *Provincial Antiquities* (1826), Roger's *Italy* (1830), Scott's *Works* (1834), and *The Rivers of France* (1833–35) are in many instances of the greatest beauty.

One of the great services Turner rendered to the art of England was the education of a whole school of engravers. His best qualities as a teacher came from the union of strength and delicacy in his work; subtle and delicate tonality was almost a new element for the engraver to deal with, but with Turner's teaching and careful supervision his engravers by degrees mastered it more or less successfully, and something like a new development of the art of engraving was the result. No better proof can be found of the advance made than by comparing the work of the landscape engravers of the pre-Turnerian period with the work of Miller, Goodall, Willmore, Cooke, Wallis, Lupton, C. Turner, Brandard, Cousen, and others who worked under his guidance. The art of steel engraving reached its highest development in England at this time. Roger's *Italy* (1830) and his *Poems* (1834) contain perhaps the most beautiful and delicate of the many engravings executed after Turner's drawings. They are vignettes, a form of art which Turner understood well. "The Alps at Daybreak," "Columbus Discovering Land," and "Datur Hora Quieti" are superb.

In 1828 Turner paid a second visit to Italy, this time of considerable duration, on the way visiting Nîmes, Avignon, Marseilles, Genoa, Spezzia and Siena, and in the following year he exhibited the "Ulysses Deriding Polyphemus," now in the National Gallery. It marks the beginning of the central and best period of Turner's power. The picture is of great power and splendour. The painting throughout is magnificent, especially in the sky. From this period till 1840 Turner was entirely absorbed in his art, and so isolated. Between 1829 and 1839 he sent fifty-five pictures to the Royal Academy, painted many others on private commission, made over four hundred drawings for engravers, besides thousands of studies and sketches from nature.

Later Work.—The first of Turner's Venetian pictures ("Bridge of Sighs, Ducal Palace and Custom House, Venice, Canaletto Painting") appeared in the Academy in 1833. Compared with the sober work of Canaletto, Turner's pictures of Venice appear like poetic dreams. Splendour of colour generally characterize them. Venice appeared to him "a city of rose and white, rising out of an emerald sea against a sky of sapphire blue." Many of these Venetian pictures belong to his later manner, and some of them, "The State Procession bearing Giovanni Bellini's Pictures to the Church of the Redeemer" (exhibited in the Royal Academy, 1841), "The Sun of Venice Going to Sea" (1843), "Approach to Venice" (1844), and "Venice, Evening, Going to the Ball" (1845), to his latest. As Turner grew older his love of brilliant colour and light became more and more a characteristic.

"The Fighting Téméraire Tugged to her Last Berth to be Broken Up" was exhibited in the Academy of 1839. Turner had all his life been half a sailor at heart: many of his best pictures are sea pieces. Hence the pathetic feeling he throws around the old three-decker, looking ghostly and wan in the evening light. "The Slave Ship," another important sea picture, was exhibited in the following year, and in 1842 "Peace: Burial at Sea," commemorative of Wilkie. His faculty for colour remained unimpaired almost to the end. He paid his last visit to the Continent in 1843, avoiding his own countrymen, an old and solitary man.

In 1850 he exhibited for the last time. He had given up attending the meetings of the Academicians; none of his friends had seen him for months; and even his old housekeeper had no idea of his whereabouts. Turner's mind had evidently given way, and with that love of secrecy which in later years had grown into a passion he had gone to hide himself in a corner of London. He had settled as a lodger in a small house in Chelsea, overlooking the river, kept by his old Margate landlady, Mrs. Booth. To the children in the neighbourhood he was known as "Admiral Booth." His short, sailor-like figure may account for the idea that he was an impoverished old naval officer. He had been ill for some weeks, and when his Queen Anne Street housekeeper at last discovered his hiding-place she found him sinking, and on the following day, Dec. 19, 1851, he died. He was buried in St. Paul's Cathedral, in deference to his wish. He left a large fortune (about £140,000) to found a charity for the "maintenance and support of male decayed artists, being born in England, and of English parents only; and of lawful issue." His pictures he bequeathed to the nation, on condition that they were exhibited in rooms of their own, and that these rooms were to be called "Turner's Gallery." The will and its codicils were so confused that after years of litigation, during which a large part of the money was wasted in legal expenses, it was found impossible to decide what Turner really wanted. A compromise was effected, his next-of-kin inheriting the bulk of his property. The Royal Academy got £20,000 and the nation got all the pictures and drawings (now housed in the National Gallery and in the Tate gallery in rooms erected by the generosity of Sir Joseph Duveen. Of the 282 pictures and studies, 199 are now framed and exhibited. Of the collection of drawings numbering over 19,000 only a part are on exhibition).

In 1843 a champion, in the person of John Ruskin, arose to defend Turner against the unjust and ignorant attacks of the press, and what at first was intended as a "short pamphlet, reprobating the manner and style of these critics," grew into the five volumes of *Modern Painters*. Ruskin employed all his eloquence and his great critical faculty to prove how immeasurably superior Turner was to all who had ever gone before, hardly restricting his supremacy to landscape art, and placing him among the "seven supreme colourists of the world."

TURNER, NAT (1800–1831), the negro leader of a insurrection in Virginia, known as the "Southampton insu tion," was born in Southampton county, Va., in 1800. Fron childhood he claimed to see visions and hear voices, and he be a Baptist preacher of great influence among the negroes. In he confided to a few companions that a voice from heaven announced that "the last shall be first," which was interprete mean that the slaves should control. An insurrection was plar and a solar eclipse in Feb., 1831, and peculiar atmospheric c tions on Aug. 13, were accepted as the signal for beginning work. On the night of Aug. 21, 1831, with seven companion entered the home of his master, Joseph Travis, and murd the inmates. After securing guns, horses and liquor they vi other houses, sparing no one. Recruits were added, in some by compulsion, until the band numbered about 60. About noo the 22nd they were scattered by a small force of whites, ha gathered. Troops, marines and militia were hurried to the s and the negroes were hunted down. In all 13 men, 18 women 24 children had been butchered. After hiding for several w Nat was captured on Oct. 30, and was tried and hanged, ha made, meanwhile, a full confession. Nineteen of his assoc were hanged and 12 were sent out of the State. The insurrec which was attributed to the teachings of the abolitionists, le the enactment of stricter slave codes.

See S. B. Weeks, "Slave Insurrections in Virginia," in *Mag of American History*, vol. xxxi. (1891), and W. S. Drewry, *Southampton Insurrection* (Washington, 1900).

TURNHOUT, town in the province of Antwerp, Belg 26 m. N.E. of that city. Pop. (1925), 25,207. It carries o active industry in cloth, playing cards and other manufact There is a breeding establishment for leeches. The hôtel de was formerly a palace of the dukes of Brabant. Two miles of Turnhout is the curious penal or reformatory colony of M plas (pop. in 1904, 2,827). The system of this establishme to allow certain approved prisoners to follow their usual occ tions within a defined area.

TURNIP (*Brassica Rapa*) a hardy biennial, which has cultivated from a remote period for its fleshy roots. The te growing tops are also used in spring as a green vegetable. so-called "root" is formed by the thickening of the primary of the seedling together with the base of the young stem (h cotyl) immediately above it. The great mass of the "root" sists of soft "wood" developed internally by the cambium and composed mainly of thin-walled, unlignified, wood-pa chyma. The stem remains short during the first year, the le forming a rosette-like bunch at the top of the "bulb"; they grass-green and bear rough hairs. In the second season the in the centre of the rosette forms a strong erect branched bearing somewhat glaucous smooth leaves. The stem and bran end in corymbose racemes of small, bright yellow flowers, w are succeeded by smooth, elongated, short-beaked pods.

The turnip probably originated in Europe or western Asia by cultivation has spread throughout the temperate zone.

The varieties of turnip are classified according to their s as (1) long varieties, with a root three or more times as lon broad; (2) tankard or spindle-shaped varieties, with a root a twice as long as broad; (3) round or globe varieties wit almost spherical root; (4) flat varieties with a root broader long; there are also many intermediate forms. Turnips are grouped according to the colour of the upper part of the which comes above ground, and according to the colour of flesh, which is white or yellow. The yellow-fleshed varie which are not hybrids between the turnip and swede, are robust, of slower growth and superior feeding value to the w fleshed turnips, and are less injured by frost.

e swede-turnips, *Brassica Napo-brassica* and *B. Rutabaga* from the turnip proper in having the first foliage-leaves ous, not grass-green, in colour, and the later leaves smooth glaucous; the root bears a distinct neck with well-marked cars, the flesh is white or yellow, firmer and more nutritious, he roots keep much better during winter. The white-fleshed (*B. Napo-brassica*) have a rough, green skin, firm white and are of irregular form. The flowers are of a bright y colour. The yellow-fleshed swede-turnips have a firm flesh, a smooth skin of a green, purple or bronze colour. lowers are buff yellow or pale orange.

CULTIVATION AND TRADE

ensive British cultivation of turnips as a forage crop for and cattle was first noticed in Suffolk about 1724; by the e of the same century the crop had won an important position husbandry of Norfolk. In 1733 Tull had demonstrated the tages of drilling and hoeing, but the crop continued to be broadcast until after the modern system had established in Border farming about 1750.

e adoption of turnip husbandry revolutionized British farm- t facilitated winter feeding of stock, the conversion of straw ard manure for the improvement of the soil, and the recla- n of light and medium soils, which had previously been un- ctive under a system that depended on bare fallowing as the of restoring fertility and freedom from weeds. The acre- turnips increased with the gradual spread of rotation hus- y, the enclosure of commons and the division of open fields ompact holdings. The increase continued during the third r of the 19th century, in the period of high farming and ive corn and meat production; but after the commencement depression which followed, the acreage began an annual e which has since been almost regular and continuous.

nip husbandry is still extensively practised in light-land districts that are not well adapted for dairying or other of pastoral farming. Large areas of turnips are mainly ated with barley and sheep, but in some districts the crop sumed wholly or partly by cattle.

e mangolds, turnips are capable of producing very large ties of digestible stock food per acre; and where the pro- n of such nutriment is the principal object in cultivating op, as in certain systems of sheep farming and in dairying ittle arable land, turnips may occasionally be grown twice cession on the same field. In most cases, however, turnips y a place in the rotation in which they serve as a fallow affording opportunities for eradicating weeds that have ap- d in preceding corn crops, and otherwise serving as a means toring the condition of the land for future corn cultivation. he preparatory cultivations for turnips, the object of creat- il conditions favourable to the growth of the crop is gener- nore or less subservient to the processes of cleaning and ring. The two objects can best be combined when it is possi- clean the corn stubble in autumn and to apply the yard re before the deep ploughing in early winter or before a d or cross ploughing in February. When autumn cleaning possible, it is customary to defer the application of the manure until spring, when it is applied in the ridges on the roots are drilled, after the weeds have been extracted propriate operations. In some cases, particularly in districts rainfall, turnips grown on land that has been cleaned in are sown on the flat and receive artificial manures only. rtificials applied in the latter case are typically 1½ cwt. te of ammonia, 5 cwt. superphosphate and 1 cwt. muriate ash per acre.

edes are drilled in May in districts north of the Trent and he farther south, where earlier sowing predisposes the crop ack of turnip flea beetle and mildew. Yellow turnips are about a month later than swedes, but are harvested—where nsumed on the land by sheep—about the same time, Novem- White turnips may be sown at different times in the sum- they are almost invariably fed without previous storage. turnips are also frequently sown broadcast and not further cultivated or thinned. Swedes and yellows, however, are usually drilled in rows about 24 in. apart and afterwards thinned out to 10–in. intervals, and horse- and hand-hoed two or three times during the summer.

Swedes contain a higher percentage of dry matter, and also of digestible nutrients, than yellow turnips, which in their turn are richer than white turnips. Ton for ton, therefore, the order of feeding value is: swedes, yellow turnips, white turnips.

There is no extensive trade in swedes, though there may occasionally be small farmer to farmer sales, and crops may be sold for feeding off on the field. This applies equally to turnips. In some districts also swedes may be sold to green-grocers, much of the south Lancashire crop, for example, being consumed in the towns. White turnips are of course specially grown in fairly considerable quantities for table use. (*See* VEGETABLE: *Culture in the United States.*) (J. R. B.; H. C. L.)

TURNSTONE (*Arenaria interpres*), a shore-bird found on the coasts of every part of the world, but breeding only in the high Arctic. About the size of a snipe, and allied to the plovers (*q.v.*), the turnstone has short legs and a heavy build. The white face, striped with black, the black gorget and white band on the wings are characteristic features. The sexes are alike. The bird feeds on small crustacea, worms, etc., which it seeks under stones. The nest contains four olive-green eggs, closely blotched with brown. Both male and female incubate.

TURNTABLE. A rotary platform which turns wagons, carriages, and locomotives. The smallest sizes are less than three feet in diameter and are without rails, being used for light temporary work or with portable tracks. In other cases rails are mounted, flush with the surface, for use inside factories or other places subject to foot or wheeled traffic. A circle of small rollers or a ring of balls supports these tables. An automatic catch prevents the table from making more than a quarter of a revolution at a time, unless it is desired to move further.

In the large tables for carriages and wagons most of the load is carried upon a centre pivot, and the two rollers at each end run on a circular rail or *race*, and function when the load is unbalanced. The rollers are attached to steel joists bolted to the main girders and the rollers can be taken off for cleaning at any time. A hand lever enables the table to be readily pulled around, then locked with a wedge which also blocks up the end so taking the load off the wheels. When there is insufficient depth available for the pit of an ordinary turntable, the "inverted girder" or "surface type" is installed, the girders being placed upside down in this type of construction. If locomotives cannot be well balanced, or rapid handling is important, power-driven turntables are chosen. In the electric tractor system, a wheel resting on the circular race is driven by a motor so as to turn the table in about a minute. Rotating gear on the winch system comprises a barrel pulling on two steel wire ropes so that one pays out while the other winds in. These operate a wheel on the race. Some turntables, for locomotive manufacturing works, carry three tracks (*e.g.*, 2 ft. 6 in., 4 ft. 8½ in., and 5 ft. 6 in.). The centre-pivot support is not applied in this case, but the uneven loads are sustained by a ring of cast-steel rollers running on the fifty-foot diameter race. Some tables are about 85 ft. in diameter and take engines up to 267 tons, 5 ft. 6 in. gauge. The electric tractor drive is fitted to these. Turntables are also used in motor garages and works.

TURNU SEVERIN, the capital of the department of Mehedinti, Rumania, on the main Walachian railway, and on the left bank of the river Danube, below the Iron Gates cataracts. Pop. (1928) 30,967. It is a modern commercial town, having a school of arts and crafts, several churches, and large government yards for the building of river steamers, lighters and tug-boats. There is a considerable trade in live stock, preserved meat, petroleum and cereals. The town, which was originally called Drobetae by the Romans, took its later name of Turris Severi, or the "Tower of Severus," from a tower built to commemorate a victory over the Quadi and Marcomanni, by the Roman emperor Severus (A.D. 222–235). Near Turnu Severin are the remains of the celebrated Trajan's bridge, the largest in the Roman Empire, built in

A.D. 103 by Apollodorus of Damascus. The river is about 4,000 ft. broad at this spot. The bridge of twenty arches was supported by stone pillars, several of which are still visible at low water.

TURNVEREIN, a German institution founded in the early part of the 19th century by Friedrich Ludwig Jahn for the purpose of furthering physical education. German settlers established branches in the United States and later their objectives were extended to include the discussion of intellectual, political, social and religious ideas. In 1925, there were in the United States 169 local societies, with a total membership of more than 30,000, not including 6,000 members of women's auxiliaries. Since 1866 they have maintained a normal college at Indianapolis, Ind., for the training of teachers of physical education.

TURPENTINE, the oleo-resins which exude from some conifers—such as *Pinus sylvestris*—and from the terebinth tree, *Pistachia terebinthus, L.* It was to the product of the latter, now known as Chian turpentine, that the term was first applied. The tree is a native of the islands and shores of the Mediterranean, passing eastward into central Asia; but the resinous exudation found in commerce is collected in the island of Chios. Chian turpentine is a tenacious semi-fluid transparent body, yellow to dull brown in colour, with an agreeable resinous odour and little taste. On exposure to air it becomes dry, hard and brittle. Turpentines are semi-fluid bodies, consisting of resins dissolved in turpentine oil, the chief constituent of which is pinene. They are largely used in the arts, being separated by distillation into rosin or colophony (*see* ROSIN), and oil or spirit of turpentine.

Crude or *common turpentine* is the commercial name for the oleo-resin yielded by several coniferous trees, both European and American. The principal European product (Bordeaux turpentine) is obtained from the cluster pine, *Pinus Pinaster,* in the Landes department of France. Crude turpentine is further yielded by the Scotch fir, *P. sylvestris,* and by the Corsican pine, *P. Laricio.* In the United States the turpentine-yielding pines are the swamp pine, *P. australis,* and the loblolly, *P. Taeda,* both inhabiting North and South Carolina, Georgia and Alabama. *Venice turpentine* is yielded by the larch, *Larix europaea; Strassburg turpentine* is obtained from the bark of the silver fir. Less known turpentines are obtained from the mountain pine, *P. Pumilio,* the stone pine, *P. Cembra,* the Aleppo pine, *P. halepensis,* etc. The so-called *Canada balsam,* from *Abies balsamea,* is also a true turpentine.

"Turps."—*Oil of Turpentine,* or *Turps,* as a commercial product is obtained from all or any of these oleo-resins, but on a large scale only from crude turpentine. The essential oil is rectified by redistillation with water and alkaline carbonates, and the water which the oil carries over with it is removed by a further distillation over calcium chloride. Oil of turpentine is a colourless, oily liquid, with a strong odour and a hot disagreeable taste. It begins to boil at about 155° C, and its specific gravity is between 0·860 and 0·880. It rotates the plane of polarized light both to right and left in varying degrees according to its sources, the American product being dextrorotatory and the French laevorotatory. It is almost insoluble in water, is miscible with absolute alcohol and ether, and dissolves sulphur, phosphorus, resins and caoutchouc. On exposure to the air it dries to a solid resin, and absorbing oxygen gives off ozone. Agitated with successive quantities of sulphuric acid and distilled in a current of steam, it yields terebene, a mixture of dipentene and terpinene mainly, which is used in medicine. Chemically, oil of turpentine is a mixture of terpenes (*q.v.*). It is largely used in the preparation of varnishes and as a medium by painters in their "flat" colours.

Pharmacology and Therapeutics.—Oil of turpentine (*Oleum terebinthinae*) is administered internally as an anthelmintic to kill tapeworm. Externally it acts as a rubefacient, an irritant and a counter-irritant. It is also an antiseptic and, in small quantities, a feeble anaesthetic. It is absorbed by the unbroken skin. The drug is largely employed as a counter-irritant, the pharmacopoeial liniments being useful in myalgia, bronchitis, "chronic rheumatism" and pleurisy.

In large doses oil of turpentine causes purging and may induce much haemorrhage from the bowel or kidneys. It is readily absorbed unchanged and has a marked contractile action upon t blood vessels. It is a nervous depressant leading even to co and total abolition of reflex action. The drug is excreted partly the bronchi and partly in the urine. Glycuronic acid also appe in the urine. It may give rise to an erythematous rash. It m not be given to the subjects of Bright's disease. At the pres time its chief uses are as constituents of fomentations and e mata and as a local disinfectant in bronchiectasis (*q.v.*).

Old turpentine and French oil of turpentine are antidotes phosphorus, forming turpentine-phosphoric acid, which is inert

TURPIN (d. *c.* 800), archbishop of Reims, was for m years regarded as the author of the legendary *Historia de Caroli Magni et Rolandi,* and appears as one of the twelve pe in a number of the *chansons de geste.* He is probably identi with Tilpin, archbishop of Reims in the 8th century, who alluded to by Hincmar, his third successor in the see. Accord to Flodoard, Charles Martel drove Rigobert, archbishop of Rei from his office and replaced him by a warrior clerk named M afterwards bishop of Trier. The same writer represents Milo discharging a mission among the Vascones, or Basques, the v people to whom authentic history has ascribed the great disa which befell the army of Charlemagne at Roncesvalles.

Flodoard says that Tilpin was originally a monk at St. De and Hincmar tells how after his appointment to Reims he oc pied himself in securing the restoration of the rights and proper of his church, the revenues and prestige of which had been paired under Milo's rule. Tilpin was elected archbishop betw 752 and 768, probably in 753; he died, if the evidence of a ploma alluded to by Mabillon may be trusted, in 794, althoug has been stated that this event took place on Sept. 2, 800. H mar, who composed his epitaph, makes him bishop for over fo years, and from this it is evident that he was elected about and Flodoard says that he died in the forty-seventh year of archbishopric. Tilpin was present at the Council of Rome in and at the request of Charlemagne Pope Adrian I. sent him pallium and confirmed the rights of his church.

The *Historia Caroli Magni* was declared authentic in 1122 by Calixtus II. It is, however, entirely legendary, being rather the c tallization of earlier Roland legends than the source of later ones, its popularity seems to date from the latter part of the 12th cent Gaston Paris, who made a special study of the *Historia,* considers the first five chapters were written by a monk of Compostella in 11th century and the remainder by a monk of Vienne between and 1119. There are at least five French translations of the *Hist* dating from the 13th century and one into Latin verse of about same time. Acccording to Potthast there are about fifty manusc of the story in existence. The *Historia* was first printed in 156 Frankfort; perhaps the best edition is the one edited by F. Caste *Turpini historia Karoli magni et Rotholandi* (Paris, 1880). It has translated many times into French and also into German, Danish English. The English translation is by T. Rodd and is in the *His of Charles the Great and Orlando, ascribed to Turpin* (London, 18 *See* G. Paris, *De pseudo-Turpino* (Paris, 1865), and *Histoire poé de Charlemagne,* new ed. by P. Meyer (1905); and V. Friedel, "Et compostellanes" in *Otia Merceiana* (Liverpool, 1899).

TURPIN, RICHARD [DICK] (1706–1739), English rob was born in 1706 at Hempstead, near Saffron Walden, Es where his father kept an alehouse. He was apprenticed t butcher, but, having been detected at cattle-stealing, joine notorious gang of deer-stealers and smugglers in Essex. On gang being broken up Turpin went into partnership with King, a well-known highwayman. To avoid arrest he finally Essex for Lincolnshire and Yorkshire, where he set up unde assumed name as a horse dealer. He was convicted at assizes of horse-stealing and hanged on April 7, 1739. Harr Ainsworth, in his romance *Rookwood,* gives a spirited accoun a wonderful ride by Dick Turpin on his mare, Black Bess, London to York. But as far as Turpin is concerned the inci is pure fiction. A somewhat similar story was told about a ce John Nevison, known as "Nicks," a well-known highwayma the time of Charles II., who to establish an alibi rode from Hill to York (some 190 m.) in about 15 hours.

TURQUOISE, a mineral much used as an ornamental s for the sake of its blue or bluish-green colour. It is gene held that the name indicates its source as a stone from Tur

nest kinds having come from Persia by way of Turkey. quoise is a crypto-crystalline mineral, occurring in small rm nodules or as an incrustation, or in thin seams and inated grains. Its mode of occurrence suggests its forma- y deposition from solution, and indeed it is sometimes found lactitic masses. The typical colour is a delicate sky-blue, e blue passes by every transition into green. In some cases olour deteriorates as the stone becomes dry, and may be sly affected by exposure to sunlight; whilst with age there n a tendency to become green, as seen in examples of ancient oise. The mineral is always opaque in mass, but generally ucent in thin splinters. Turquoise takes a fair polish, but stre is feeble, and inclines to be waxy; the hardness is nearly specific gravity between 2·6 and 2·8.

ch discussion has arisen as to the chemical composition of oise. It is commonly regarded as a hydrous aluminium nate having the composition $2Al_2O_3{\cdot}P_2O_5{\cdot}5H_2O$ or rather $PO_4(OH)_4$, coloured with a variable proportion of a copper nate, or perhaps partly with an iron phosphate. S. L. Pen- 1900), however, was led by careful analysis of turquoise Nevada to propose the general formula:

$$[Al(OH)_2,Fe(OH)_2,Cu(OH),H]_3PO_4.$$

alysis of minute crystals from Virginia gave the formula $Al_2O_3{\cdot}2P_2O_5{\cdot}9H_2O$. An ingenious counterfeit of turquoise een formed by compressing a precipitate of cupriferous nium phosphate.

quoise is usually cut as an ornamental stone in circular or cal form, with a low convex surface. In the East, where it d not only for personal ornament but for the decoration of r-handles, horse-trappings, etc., the pieces are usually of ir- r shape. In Persia, where the finest turquoise is found, the have been worked for at least eight centuries. The principal y is near Nishapur, in the province of Khorasan. Here the oise occurs in narrow seams in a brecciated trachyte-por- . It is found also in some other localities in Persia and in stan. In the Sinai Peninsula relics of extensive ancient min- erations for turquoise show that the rock was at one time d with flint implements. The mineral here occurs as nodules ed sandstone and as an incrustation on the joint-faces.

ncient Mexico much use was made of turquoise as an inlay saic work, with obsidian, malachite, shell and iron pyrites. of extensive workings are found in the mountains of Los os near Santa Fé in New Mexico, where mining for tur- is now actively carried on. One of the hills in which old ngs occur has been called Mt. Chalchihuitl, since it is be- that the turquoise was known by the name chalchihuitl, in some places was applied also to jade. The matrix at erillos is an altered augite-andesite, in which the turquoise in thin veins and in small nodules in patches of kaolin.

quoise is sometimes termed by mineralogists callaite, since elieved to be the *callais* of Pliny. The name callainite was ted by J. D. Dana for a bright green mineral which was in the form of beads, with stone hatchets, in ancient graves Mané-er-H'roek (Rock of the Fairy), near Locmariaquer ttany, and which A. Damour sought to identify with Pliny's . The mineral seems to be identical with variscite (*q.v.*). ne-turquoise" or odontolite, also known as "occidental tur- ," is merely fossil bone or ivory coloured by iron phosphate nite) or perhaps stained in some cases by cupriferous solu- and is readily distinguished from true turquoise by showing c structure under the microscope.

RRIFF, burgh of Aberdeenshire, Scotland. Pop. (1921) 38½ m. N.W. of Aberdeen. Only the choir and belfry of cient church remain. On May 14, 1639, the national strug- r civil and religious liberty was inaugurated in the county he skirmish known as the Trot of Turriff. Some 4 m. S. are mains of the castle of Towie Barcley.

RRIS LIBISONIS (modern Porto Torres, an ancient t at the N.W. extremity of Sardinia. It was probably of n origin, and in Pliny's time it was the only colony in the . A Roman bridge of seven arches, the ruins of a temple known as Il Palazzo del Re Barbaro), which an inscription found there shows to have been restored (A.D. 247–249) by the *praefectus* of the province, together with the basilica, an aqueduct, various buildings and some rock tombs, still exist.

TURTLE, the name given to the marine and larger fresh-water reptiles of the order Chelonia. (*See* TORTOISE.)

TURTLE CREEK, a manufacturing and coal-mining borough of Allegheny county, Pennsylvania, U.S.A., 10 m. S.E. of Pittsburgh, near the Monongahela river. Pop. (1920) 8,138 (84% native white). Electrical goods are the principal products.

BY COURTESY OF THE WILD FLOWER PRESERVATION SOCIETY

THE COMMON TURTLE-HEAD, OR SNAKE-HEAD, (CHELONE GLABRA)

TURTLE-HEAD (*Chelone*), a genus of North American herbs of the family Scrophulariaceae (*q.v.*), comprising four species, all smooth perennials which bear clusters of showy flowers, the corolla resembling a turtle's head. The common turtle-head (*C. glabra*), with white flowers, occurs from Newfoundland to Manitoba and southward. *C. Lyoni* and *C. obliqua*, of the south-eastern States, and *C. nemorosa*, found from California to Washington, have red or purple flowers.

TURTON, urban district, Darwen parliamentary division, Lancashire, England, 4 m. north of Bolton on L.M.S. railway. Pop. (1921) 12,154. It manufactures cotton goods and there are large stone quarries in the vicinity. Turton tower, containing some fine contemporary woodwork, dates from the 16th century.

TUSCALOOSA, a city of western Alabama, U.S.A., the county seat of Tuscaloosa county; on the Warrior river and Federal highway 11, 55 m. S.W. of Birmingham. It has a municipal airport and is served by the Louisville and Nashville and the Mobile and Ohio railways and barges of the Inland Waterways Corporation (Mississippi-Warrior Service). Pop. (1920) 11,996 (38% negroes); estimated locally at 25,000 in 1928. The city lies at the edge of the great coal and mineral deposits of Alabama, in a rich agricultural region. There are many fine old residences and gardens, dating from the time (1826–46) when Tuscaloosa was the capital of the State; and the older streets are lined with magnificent water oaks, planted in the years beginning with 1839. Tuscaloosa is the seat of the State home for mentally deficient children, the Bryce (State) hospital for the insane (1861), Stillman Institute (a Presbyterian theological seminary for negroes; 1876), and the University of Alabama, which occupies 300 ac. adjacent to the city limits. The university was founded in 1820, on an endowment of 46,080 ac. of land, donated by the U.S. Congress in 1819, and it was opened to students in 1831. On April 4, 1865, a body of Federal cavalry set fire to and completely destroyed all the buildings except the astronomical observatory and a little house where the records were kept, and instruction was necessarily suspended until 1869. By way of restitution, a second grant of 46,080 ac. was made by Congress in 1884. The enrolment for the year 1926–27 was 6,151, including 2,395 in the extension division. Tuscaloosa is the trade centre of a large cotton-growing, lumbering, farming and dairying region. Ample hydro-electric power is available from the development on the Coosa river. There are 90 plants in or near the city (including foundries, blast furnaces, coke ovens and paper mills) with an output in 1927 of $106,432,000. The city valuation for 1928 was $16,232,872.

Tusca-Lusa ("Black Warrior") was a Choctaw chief (commemorated by a granite monolith in Court House square), who, according to tradition, hanged himself, to escape capture, after a desperate battle with De Soto in 1540 somewhere in this region. In 1816 Emanuel York and John Bartow came from Tennessee and settled on the plain where the city now stands. A town site was laid out and the city was chartered in 1819, and in 1825 it was chosen to be the seat of government of the State. Industrial development began after the removal of the capital (1846).

TUSCANIA, a town of the province of Rome, Italy, 15 m. N.E. of Corneto by road, 545 ft. above sea-level. Pop. (1921), 4,561 (town), 5,454 (commune). The ancient town lay on the Via Clodia; its Etruscan tombs have yielded valuable antiquities, and remains of a large thermal establishment of the Roman period have also been found. The mediaeval walls with their towers are still preserved. On the ancient citadel hill is the Romanesque church of S. Pietro, belonging to four different periods—739, 1093 (the date of the reconstruction of the crypt), the middle of the 12th and the end of the 12th century. It has the shape of a Roman basilica, with a nave and two aisles and one apse. The elaborate façade with its rose window also belongs to the 12th century. S. Maria in the valley below dates from 1050 to 1206, and has a similar façade and a massive square campanile. In the town are two other Romanesque churches. The town was called Toscanella until 1912, when it resumed the name which it bore in ancient Latin times.

TUSCANY (*Toscana*), a territorial division of Italy, consisting of the western part of the centre of the peninsula, bounded north-west by Liguria and Emilia, east by the Marches and Umbria, south-east by the district of Lazio and west by the Mediterranean. It consists of nine provinces, Arezzo, Firenze (Florence), Grosseto, Livorno (Leghorn), Lucca, Massa-Carrara, Pisa, Pistoia and Siena, and has an area of 8,997 sq. miles. Pop. (1921) 2,766,291 (showing a very low relative increase—only 200,000—since 1901). The chief railway centre is Florence.

Except towards the coast and around Lucca, Florence and Arezzo, where the beds of prehistoric lakes form plains, the country is hilly, being intersected with sub-Apennine spurs, some of which have extensive forests. The most fertile country in Tuscany is in the valley of the Arno. In the neighbourhood of Lucca the irrigation system dates from 1376, while at Coltano, near Pisa, it goes hand in hand with land reclamation. In strong contrast with this is the coast plain known as the Maremma, 850 sq.m. in extent, where malaria has been prevalent since the depopulation of the country in the middle ages. An elaborate system of drainage, begun in the 19th century, is still being completed. The greater part of the Maremma now affords pasture to large herds of horses and half-wild cattle, but the drier parts are cultivated. The hill country just inland, especially near Volterra, has poor soil, largely clayey, and subject to landslips, but is rich in minerals, boric acid and mineral springs. But for the Maremma, Tuscany is one of the most favoured regions of Italy. The climate is temperate, and the rainfall not excessive.

The following is a list of the chief agricultural products in 1927 (the wine is largely produced in the district of Chianti, south-south-west of Florence):

	Area	Tons
	Acres	
Wheat	881,250	387,500
Rye	10,250	4,090
Barley	16,250	6,160
Oats	88,750	40,530
Maize	218,250	104,100
Broad beans	53,000	18,920
Runner beans	75,150	10,000
Sugar beets	13,250	59,690
Garden produce	17,000	69,630
Potatoes	50,150	180,700
Silk cocoons	..	1,386
Tobacco	7,800	3,397
Hay	..	1,704,600
Vines	1,436,750	690,800 (grapes)
		95,634,000 (wine, gal.)
Olives	780,000	109,170 (olives)
		4,023,800 (olive-oil, gal.)
Fruits (various)	..	27,690
Chestnuts	384,450	142,280

The mineral products of the Florence district (including the provinces of Siena, Grosseto and Livorno [Leghorn]) were (1926) in tons: Iron, 470,170; manganiferous iron, 17,730; copper, 6,674; mercury, 147,194 (from Monte Amiata); iron pyrites, 462,755; marble, 509,805 (337,083 of which from the Carrara district); lignite, 567,615 (province of Arezzo), 120,207 (province of Siena). There are cotton mills at Florence, Leghorn, Prato, Pisa; Prato (*q.v.*) is an important centre of the wool industry which flourished more in Florence in the middle ages than at present. Hydro-electric power, mainly derived from the Serchio basin, is supplemented by the plants at Terni (*q.v.*) in Umbria. Glass is made at Pisa. Porcelain and ceramic products are made especially at Signa and Doccia, near Florence, where silk, straw hats, etc., are also manufactured; and much furniture is produced. The Tuscans are, indeed, active, both in agriculture and industry. There are universities at Florence, Pisa and Siena. Viareggio and Leghorn are much frequented for sea-bathing, the latter is a prosperous port.

The main art centres of Tuscany are Florence, Pisa and Siena, the headquarters of the chief schools of painting and sculpture from the 13th century onwards. While the first city, however, bore as prominent a part as any in Italy in the Renaissance, the art of Pisa ceased to advance at a comparatively early period, its importance being in ecclesiastial architecture in the 12th, and sculpture in the 13th century. Siena, too, never accepted the Renaissance to the full, and art retained its individuality.

The language of Tuscany is remarkable for its purity of idiom and its adoption by Dante and Petrarch probably led to its being the literary language of Italy. (*See* ITALIAN LANGUAGE.)

See E. Repetti, *Dizionario geografico fisico storico della Toscana* (6 vols. Florence, 1834–46). On mediaeval and Renaissance architecture and art there are innumerable works. Among those on architecture may be mentioned the great work of H. von Geymüller and C. von Stegmann, *Die Architektur der Renaissance in Toscana;* Burckhardt-Haupt, *Palastarchitektur von Oberitalien und Toscana von 16 Jahrhundert* (6 vols.); B. Patzak, *Palast und villa in Toscana* (2 vols. 1912–13). (T. A.)

HISTORY

Etruria (*q.v.*) was finally annexed to Rome in 351 B.C. and was later known as Tuscia, but was a larger area than the present Tuscany, comprising the northern part of Latium. Under Charlemagne the name of Tuscia or Toscana became restricted to the area north of Viterbo and Bolsena. One of the earliest of the Frankish marquises in the 9th century was Boniface, who in 828 fought with success against the Saracens in Africa. The line of marquises ended with Boniface II. (or III.), who was murdered in 1052. His widow, Beatrice, in 1055 governed the country till her death in 1076, when she was succeeded by Matilda (*q.v.*), her only child by her first husband. Matilda died in 1115 without issue, bequeathing all her extensive possessions to the Church. The consequent struggle over her inheritance between the popes and the emperors enabled the principal cities of Tuscany gradually to assert their independence, so that Tuscany as a whole was no longer a state.

The Return of the Medici.—After the surrender of Florence to the Imperialists in Aug. 1530 the Medici power was re-established, and Alessandro de' Medici was made duke of Florence, the dignity to be hereditary in the family. In the reign of Cosimo III. Siena was annexed (1559); the title of grand duke of Tuscany was conferred on that ruler in 1567 by Pope Pius V., and recognized in the person of Francis I. by the emperor Maximilian II. in 1576. Under his descendants Tuscany played but a small part in European history; a wave of degeneracy set in, affecting both the people and the new and shoddy nobility, and art and letters declined. Giovan Gastone, the last Medicean grand-duke, being childless, it was agreed by the treaty of Vienna (1738) at his death Tuscany should be given to Francis, duke of Lorraine, husband of the archduchess Maria Theresa, afterwards empress. In 1737 Giovan Gastone died, and Tuscany was governed by Francis II., who resided in Austria, by a series of foreign regents. (The history of Tuscany from 1530 to 1737 is given in great detail under MEDICI.)

Reforms of Leopold I.—Francis, who had been elected emperor in 1745, died in 1765 and was succeeded on the throne of the grand duchy by his younger son, Leopold I. Leopold resided in Tuscany and proved one of the most capable and remarkable of the reforming princes of the 18th century. He

ted Tuscans for foreigners in government offices, introduced stem of free trade in foodstuffs (at the suggestion of the se Sallustio Bandini), and promoted agriculture. He re-nized taxation on a basis of equality for all citizens, reformed dministration of justice and local government, and suppressed re and capital punishment. His reforms in Church matters a great stir at the time, for he curbed the power of the y, suppressed some religious houses, reduced the mortmain, rejected papal interference. With the aid of Scipione de' bishop of Pistoia, he even attempted to reform Church oline, but Ricci's action was condemned by Rome and he forced to resign. (*See* PISTOIA, SYNOD OF.) At the death of rother, Joseph II., in 1790, Leopold became emperor and ved to Vienna. After a brief regency he appointed his second Ferdinand III., grand duke.

e French Occupation.—During the French revolutionary a French force entered Florence in 1799 and was welcomed small number of republicans. The grand duke was forced to nd a provisional government on French lines was established. he great mass of the people were horrified at the irreligious cter of the new régime, and a counter-revolution broke out ezzo. Bands of armed peasants marched through the country e cry of "Viva Maria!" and expelled the French, not with-committing many atrocities. With the assistance of the ians Florence was occupied and a government established in ame of Ferdinand. But after Bonaparte's victory at Marengo French returned in great force, dispersed the bands, and re-ed Florence (Oct. 1800). They, too, committed atrocities acked the churches, but they were more warmly welcomed before by the people, after the experience of Austro-Aretine Joachim Murat set up a provisional government, and by eace of Lunéville Tuscany was made a part of the Spanish nions and erected into the kingdom of Etruria under Louis, of Parma (1801). The new king died in 1803, leaving an t son, Charles Louis, under the regency of his widow, Marie e of Spain. Marie Louise ruled until 1807, when the em-Napoleon obliged Charles IV. of Spain to cede Tuscany to compensating Charles Louis in Portugal.

om 1807 to 1809, when Napoleon's sister, Elisa Baciocchi, nade grand duchess, Tuscany became a French department. h ideas had gained some adherents among the Tuscans, but majority the new institutions, although they produced much ess, were distasteful as subversive of cherished traditions. Napoleon's defeats in 1814, Ferdinand III. returned, warmly med by nearly everybody, for French rule had proved op-ve, especially on account of the heavy taxes and the drain of ription. At the Congress of Vienna he was formally rein-l with certain additions of territory and the reversion of (incorporated in 1847).

e Restoration.—The restoration in Tuscany was unaccom-d by the excesses which characterized it elsewhere, and much e French legislation was retained. Ferdinand was succeeded 24 by his son, Leopold II., who continued his father's policy enevolent but enervating despotism. When the political ment consequent on the election of Pius IX. spread to ny, Leopold, in Feb. 1848, granted a constitution. A n contingent took part in the Piedmontese campaign against ia, but the increase of revolutionary agitation in Tuscany, nating in the proclamation of the republic (Feb. 9, 1849), Leopold's departure for Gaeta to confer with the pope ing of Naples. Disorder continuing, he was invited to return, e did so, but accepted the protection of an Austrian army, ich act he forfeited his popularity (July 1849). In 1852 he lly abrogated the constitution, and three years later the ians departed. When in 1859 a second war between Pied-and Austria became imminent, the revolutionary agitation out once more. There was a division of opinion between noderates, who favoured a constitutional Tuscany under ld, but forming part of an Italian federation, and the popular who aimed at the unity of Italy under Victor Emmanuel. t a compromise was arrived at and the grand duke was sted to abdicate in favour of his son, grant a constitution, and take part in the war against Austria. Leopold having rejected these demands, the Florentines rose as one man and obliged him to quit Tuscany (April 27, 1859).

Union with the Italian Kingdom.—A provisional government, led by Ubaldino Peruzzi and afterwards by Bettino Ricasoli, was established. It declared war against Austria and then handed over its authority to Boncompagni, the Sardinian royal commissioner (May 9). A few weeks later a French force under Prince Napoleon landed in Tuscany to threaten Austria's flank, but in the meanwhile the emperor Napoleon made peace with Austria and agreed to the restoration of Leopold and other Italian princes. Victor Emmanuel was obliged to recall the royal commissioners, but together with Cavour he secretly encouraged the provisional governments, and the constituent assembly of Tuscany voted for annexation to Sardinia. The king accepted the annexation and appointed his kinsman, Prince Carignano, viceroy of Central Italy, with Ricasoli as governor-general (March 22, 1860). On Feb. 18, 1861, the kingdom of Italy, comprising Tuscany, was proclaimed.

TUSCARORA, an Indian tribe of Iroquoian family, originally numbering 5,000, in North Carolina. Encroachments by the whites, including kidnapping of their children as slaves, led to a war with the settlers (1711–13), at the end of which the Tuscarora fled or drifted northward and were admitted into the League of the Iroquois as a sixth nation. About 700 survive in Canada and New York.

TUSCULUM, an ancient city of Latium, in a commanding position on the north edge of the outer crater ring of the Alban volcano, 1½ m. N.E. of the modern Frascati. The highest point is 2,198 ft. above sea-level. It has a very extensive view of the Campagna, with Rome lying 15 m. distant to the north-west. Rome was approached by the Via Latina (from which a branch road ascended to Tusculum, while the main road passed through the valley to the south of it), or by the Via Tusculana.

According to tradition, the city was founded by Telegonus, the son of Ulysses and Circe. When Tarquinius Superbus was expelled from Rome his cause was espoused by the chief of Tusculum, Octavius Mamilius, who took a leading part in the formation of the Latin League, composed of the thirty principal cities of Latium, banded together against Rome. Mamilius commanded the Latin army at the battle of Lake Regillus (497 B.C.), but was killed, and the predominance of Rome among the Latin cities was practically established. In 381 B.C., the people of Tusculum received the Roman franchise. Several of the chief Roman families were of Tusculan origin, *e.g.*, the gentes Mamilia, Fulvia, Fonteia, Juventia and Porcia (to which the Catos belonged). By the end of the Republic, and still more during the imperial period, the territory of Tusculum was one of the favourite places of residence of the wealthy Romans. The number and extent of the remains is very great. Even in the time of Cicero we hear of eighteen owners of villas there. Much of the territory (including Cicero's villa), but not the town itself, which lies far too high, was supplied with water by the Aqua Crabra. On the hill of Tusculum itself are remains of a small theatre (excavated in 1839), with a reservoir behind it, and an amphitheatre. Both belong probably to the imperial period, while a temple (the substructures of which are preserved), often called the villa of Cicero, or of Tiberius, near the latter, is probably earlier. Between the amphitheatre and the theatre lay the Forum. The citadel—which stood on the highest point, an abrupt rock—was approached only on the side, towards the city. Upon it remains of the mediaeval castle, which stood here until 1191, are visible.

It was here that Cicero composed his *Tusculan Disputations* and other philosophical works. His villa must have been at or near Grotta Ferrata and what is now known as Poggio Tulliano a little to the east (where remains of a villa exist) may well have been its site. After the transference of the seat of empire to

Constantinople, Tusculum became a very important stronghold, and in the 10th–12th centuries its counts occupied a leading position in Rome and were specially influential in the selection of the popes. During the 12th century there were constant struggles between Rome and Tusculum, and in 1191 the Romans, supported by the German emperor, gained the upper hand, and the whole city was destroyed.

See L. Canina, *Descr. dell' antico Tusculo* (Rome, 1841); A. Nibby, *Dintorni di Roma*, iii. 293 (2nd ed., Rome, 1841); H. Dessau in *Corp. inscript. lat.* pp. 252 *sqq.* (Berlin, 1887); F. Grossi-Gondi, *Il Tuscolano nell' età classica* (Rome, 1907); T. Ashby in *Papers of the British School at Rome*, iv., v. (London, 1907, 1909). (T. A.)

TUSKEGEE (tŭs-kē'gĕ), a city of Alabama, U.S.A. Pop. (1920), 2,475. It is the seat of U.S. Veterans Bureau hospital 91 (for negroes) and of Tuskegee Normal and Industrial institute (for negroes), founded in 1880 by Booker T. Washington (*q.v.*), who was its principal until his death in 1915, and endowed by Congress in 1889 with 25,000 ac. of land. The institute provides practical training for many trades and agricultural occupations, and for nursing, teaching, home-keeping and commercial positions. In the year 1927–28 it gave systematic instruction to 3,323 persons from 31 States and 9 foreign countries. Its "movable school" (a motor truck carrying tools and equipment, two demonstrators and a nurse) travels through the remote rural districts of the Black Belt, teaching the negroes how to improve their working methods, health and living conditions. A two-day conference, representative of the South, is held in December.

TUSSAUD, MARIE (1760–1850), founder of "Madame Tussaud's Exhibition" of wax figures in London, was born in Berne in 1760, the daughter of Joseph Grosholtz (d. 1760), an army officer. She began to model figures for her uncle, Dr. J. C. Curtius, in Paris. It was from Curtius's exhibition that the mob obtained the busts of Necker and the duke of Orleans that were carried by the procession when on July 12, 1789 the first blood of the French Revolution was shed. Marie Grosholtz modelled the heads of many of the prominent leaders and victims of the Revolution, and was herself for three months a prisoner. In 1794 she married a Frenchman named Tussaud, from whom she was separated in 1800. She then removed to London, taking with her the nucleus of her collection from the *cabinet de cire* in the Palais Royal, and the idea of her "Chamber of Horrors" from Curtius's *Caverne des Grands Voleurs*, in the Boulevard du Temple. Her wax figures were first shown in the Strand, and through the provinces, and finally the exhibition was established in permanent London quarters in Baker Street in 1833. Here Mme. Tussaud died on April 16, 1850. The exhibition was moved in 1884 to a large building in Marylebone Road. It was destroyed by fire in 1925 and after reconstruction reopened in 1928.

See J. T. Tussaud, *The Romance of Madame Tussaud* (1920).

TUSSER, THOMAS (*c.* 1524–1580), English poet, son of William and Isabella Tusser, was born at Rivenhall, Essex, about 1524. He was a chorister at Wallingford castle, and then at St. Paul's cathedral, and from there went to Eton college. He has left a quaint account of his privations at Wallingford, and of the severities of Nicholas Udal at Eton. He was elected to King's college, Cambridge, in 1543, moved to Trinity Hall, and on leaving Cambridge went to court in the service of William, 1st Baron Paget of Beaudesart, as a musician. After ten years of life at court, he married and settled as a farmer at Cattiwade, Suffolk, near the river Stour, where he wrote his *Hundreth Good Pointes of Husbandrie* (1557, 1561, 1562, etc.). He never remained long in one place. For his wife's health he removed to Ipswich. After her death he married again, and farmed at West Dereham. He then became a singing man in Norwich cathedral. After farming at Fairsted, Essex, he removed to London, whence he was driven by the plague of 1572–73 to find refuge at Trinity Hall, being matriculated as a servant of the college in 1573. At death he had a small estate at Chesterton, Cambridgeshire. Thomas Fuller says he "spread his bread with all sorts of butter, yet none would stick thereon." He died on May 3, 1580.

The *Hundreth Good Pointes* was enlarged to *A Hundreth good pointes of husbandry, lately maried unto a hundreth good poyntes of huswifery* . . . the first extant edition of which, "newly corrected and amplified," is dated 1570. In 1573 appeared *Five hundreth poin of good husbandry* . . . (reprinted 1577, 1580, 1585, 1586, 1590, et The numerous editions of this book, which contained a metri autobiography, prove that the homely and practical wisdom Tusser's verse was appreciated. He gives directions of what is be done in the farm in every month of the year, and minute instr tions for the regulation of domestic affairs in general. The la editions include *A dialogue of wyvynge and thryvynge* (1562). Mod editions are by William Mavor (1812), by H. M. W. (1848), and W. Payne and Sidney J. Herrtage for the English Dialect Soci (1878).

TUTANKHAMUN: *see* IKHNATON.

TUTBURY, town, Burton parliamentary division Staffo shire, England, 4½ m. N.W. of Burton-upon-Trent, picturesqu situated on the river Dove. Pop. (1921) 2,062. It is on the L.N and L.M.S. railways, but the railway station is in Derbyshire. T fine church of St. Mary has a nave of rich Norman work wit remarkable western doorway. There are ruins of a large cas standing high above the valley; these include a gateway of 1 century work, strengthened in Caroline times, a wall enclosing broad "Tilt Yard," and portions of dwelling rooms. Glass is staple manufacture. Alabaster is found in the neighbourhood.

Tutbury (*Toteberie, Stutesbury, Tuttebiri, Tudbury*) is said have been a seat of the Mercian kings. After the Conqest it granted to Hugh d'Avranches, who appears to have built the fi castle there. At the time of the Domesday Survey the castle held by Henry de Ferrers. Tutbury was the centre of an hon in Norman times, the castle and town continuing in the hands the Ferrers until 1266, when they were forfeited to the Crown granted to Edmund Crouchback, earl of Lancaster. They are s part of the duchy of Lancaster. Tutbury castle was partially built by John of Gaunt. Later it was, for a time, the prison Mary Queen of Scots. During the Civil War it was held for king but surrendered to the parliamentary forces (1646), and reduced to ruins by order of parliament (1647).

TUTICORIN, a seaport of British India in the Tinneve district of Madras. Pop. (1921) 44,522. It is the southern minus of the South Indian railway, 443 m. S.W. of Madras c In connection with this railway a steamer runs to Colombo, m. distant by sea. Tuticorin is an old town, long in possessi of the Dutch, and has a large Roman Catholic population. used to be famous for its pearl fisheries and pearl fishing was ag engaged in successfully in 1926. There are industrial and tra ing schools, and a mission centre of the Society of the Pro gation of the Gospel. Salt is manufactured, cotton woven, there are cotton ginning and pressing factories. Tuticorin is 2nd port of Madras, though it has only an open roadstead, wh vessels must anchor 5 to 7 miles from the shore. A deepwa harbour was in process of construction in 1927, and considera sums have recently been spent on a dry dock and port equipme

TUTTLINGEN, a town of Germany, in the republic Württemberg, on the left bank of the Danube, 37 m. by rail N of Schaffhausen, and at the junction of lines to Stuttgart Ulm. Pop. (1925) 16,281. Tuttlingen, a very ancient place, belonged to Württemberg since 1404. Its chief manufactures shoes, cutlery, surgical instruments and woollen goods.

TUXEDO, a town of Orange county, New York, U.S.A., m. N.N.W. of New York city; served by the Erie railroad. P (1925) 2,969 (State census). About 1½ m. from the station Tuxedo lake, in a tract of 13,000 ac. which was taken for d by the elder Pierre Lorillard in 1814. He built a shooting here, and his grandson Pierre Lorillard (1833–1901) formed Tuxedo Park Association for the development of the estate, wh resulted in the formation of the Tuxedo club and the open (June 1, 1886) of Tuxedo park.

TUY, a city of north-western Spain, in the province of Pon vedra, on the right bank of the river Miño (Portuguese *Minh* opposite Valença do Minho, which stands on the left bank Portuguese territory. Pop. (1920), 12,529. During part of 7th century Tuy was the Visigothic capital. It was taken fr the Moors by Alphonso VII. in the 12th century.

Tuy is the southern terminus of the railways to Santiago Compostela and Corunna; Valença do Minho is the northe terminus of the Portuguese railway to Oporto. To the east

y is the river Louro, a right-hand tributary of the Miño abound- in fishes; and beyond the Louro, on the railway to Corunna, the hot mineral springs of San Martin de Caldelas. The hedral, founded in the 12th century, but largely restored be- en the 15th and 19th, is of a fortress-like architecture.

TUZLA or **DONJI SOLI,** a town of Bosnia, Yugoslavia, utifully situated on the Jala or Julla. Pop. (1921) 13,354, ost all, including a permanent colony of gipsies, being Mus- s. Tuzla is the seat of a district court and an Orthodox bishop, h several churches, many mosques, a hospital, gymnasium and mercial school. Besides a large ammonia soda factory, and generating of electric power, it has a vigorous trade in in, live stock, plums, bricks, timber and coal from the sur- nding hills, where there is a colony of Hungarian miners, ile the salt springs, owned by the State, are unrivalled in the kan peninsula. It was here that the sugar beet was first cul- ated in Bosnia. The town was known by the Romans as Ad inas; in mediaeval documents it appears as Sou Sow or Soli.

TVER, a province of the Russian S.F.S.R., surrounded by se of Smolensk, Pskov, Novgorod, Cherepovetz, Yaroslavl and scow, and not coinciding with the pre-1917 province of that ne. Area 61,095 sq.km. Pop. (1926) 2,239,177, mainly Great ssians, with Karelians in the north. The Volga, Southern Dvina d Msta rise in marshes and lakes on the Valdai plateau (800– 00 ft.) in the west of the province.

The plateau is built up chiefly of Carboniferous limestones, er and upper, lying on Devonian and Silurian deposits, which p out only in the denudations of the lower valleys. The whole covered by a thick sheet of boulder clay, the bottom-moraine the Scandinavo-Russian ice-sheet, and by subsequent lacustrine posits. Lakes are numerous, Lake Seliger near the sources the Volga and Lake Mzstino being the largest.

The climate is continental with severe winter frosts of five nths' duration and an average July temperature of 67° F. Av- ge rainfall 18–20 in. per annum. Coniferous forests, especially , cover 32·2% of the province, and 12% is marsh land. In remaining area meadow and grassland prevail, ploughed land upying only 25%. There has been a marked diminution of in production since 1887 and dairying, with an export trade butter and cheese, is developing, as is the cultivation of pota- s, flax and grass. Rye, oats and barley are the chief grain ps. Sheep, working and milch cattle, pigs and a few goats are d. Coal beds exist, but are little worked.

Hunting and fishing supplement the income of the peasants, and re are koustar (peasant) industries of leather and fur prepara- n, textiles and wooden wares, with the preparation of pitch and . Factory industries include saw-milling, flour-milling, the mak- of leather goods, textiles, bricks, glass, machinery, oil-pressing, rch preparation, distilling and brewing. Vyshniy-Volochok and zev have populations of over 30,000 and Tver has over 100,000.

The province is well drained by the upper Volga and its tribu- ies, especially the Tvertsa and Mologa; 17% of the rivers are ilable for steam navigation, and boats and rafts can be floated many of the others. The Vyshniy-Volochok system of canals nects the Volga with the Baltic and the Tikhvin system con- ts the Mologa with Lake Ladoga. Railways are comparatively d and the province is thus well situated for trade, especially as ies on the direct route between Moscow and Leningrad.

TVER, the chief town of the above province, situated on both nks of the Volga, at its confluence with the Tvertsa in 56° N., 35° 48′ E. The low right bank is protected from inunda- ns by a dam. The town is growing rapidly; its population in 00 was 45,644 and in 1926 it had reached 106,021. Its situ- on on the Moscow-Leningrad railway and on the navigable lga has given it great trading importance, as a collecting centre a productive region and a distributing centre via the upper lga of goods from Leningrad and Moscow. Its chief manufac- es are machinery, textiles and leather goods.

A fort was erected in 1180 at the mouth of the Tvertsa to tect the Suzdal principality against Novgorod. In the 13th cen- y it became the capital of an independent principality, and nained so until the end of the 15th century. Michael, prince of Tver, was killed (1318) fighting against the Tatars, as also was Alexander his son. It long remained an open question whether Moscow or Tver would ultimately gain the supremacy in Great Russia, and it was only with the help of the Tatars that the princes of the former eventually succeeded in breaking down the independence of Tver. In 1486, when the city was almost entirely burned down by the Muscovites, the son of Ivan III. became prince of Tver; the final annexation to Moscow followed four years later. In 1570 Tver had to endure, for some reason now difficult to understand, the vengeance of Ivan the Terrible, who ordered the massacre of 90,000 inhabitants of the principality. In 1609–12 the city was plundered both by the followers of the second false Demetrius and by the Poles.

TWAIN, MARK, the pen-name of SAMUEL LANGHORNE CLEMENS (1835–1910), American novelist and humorist, was born at Florida (Mo.), Nov. 30, 1835. His father, a happy-go-lucky storekeeper and lawyer from Tennessee, popularly known as "Judge" Clemens, moved when the boy was four years old to Hannibal (Mo.), dying eight years later and leaving the family all but destitute. Little Sam had virtually no formal education, but his imagination was early stored with the lore of the Mississippi river and the negroes who peopled the neighbourhood. As his brother's assistant on the Hannibal *Journal* he learned type-setting and became a journeyman printer, travelling as far eastward as New York and Philadelphia before he was 19. Drawn back to the Mississippi by the "permanent ambition" of his boyhood to become a pilot, he set to work "learning the river," getting "personally and familiarly acquainted," as he says in *Life on the Mississippi,* "with all the different types of human nature that are to be found in fiction, biography or history." At the beginning of the Civil War in 1861, the river trade came to an end, and young Clemens soon set out for the West with his brother Orion, who had just been appointed lieutenant governor of Nevada. There, in the neighbourhood of Carson City, he had a most hilarious but equally unlucrative experience as a gold miner, the record of which he has left in *Roughing It,* the classic account of the post-'49 pioneering epoch in the West. Soon he turned to journalism on the Virginia City *Enterprise,* adopting the *nom de plume* "Mark Twain," a call used by Mississippi pilots in taking soundings on the river. Moving to San Francisco, he became a member of the witty group that gathered about the *Golden Era* and included Artemus Ward, Charles Warren Stoddard, Bret Harte and Orpheus C. Ker, and with the publication of *The Celebrated Jumping Frog of Calaveras County* found himself famous overnight. On the wave of this notoriety he went to New York, where he delivered his "serio-humorous" lecture on the Sandwich Islands at Cooper Institute. In June, 1867, on a commission to contribute letters to the San Francisco *Alta California,* he joined the party embarking on the steamship "Quaker City" for the tour of the Mediterranean described in *The Innocents Abroad.* With the publication of these letters, which had a prodigious sale, Mark Twain immediately became the most widely read author in America. In 1870, he married Olivia L. Langdon and moved to Hartford, which became his home for the next 30 years.

He settled down at once to the trade of authorship, publishing *Roughing It* in 1872, collaborating in 1874 with Charles Dudley Warner in *The Gilded Age,* his sole novel of contemporary manners which contained the famous character portrait, Colonel Sellers, and writing *The Adventures of Tom Sawyer* (1875). In 1880 he visited Europe a second time, recording his experiences humorously in *A Tramp Abroad.* In 1882 he published his romance for children, *The Prince and the Pauper,* which was followed in successive years by *Life on the Mississippi* and his masterpiece, *The Adventures of Huckleberry Finn,* a sequel to *Tom Sawyer.* Meanwhile his energy, which had found insufficient vent in his literary work, had turned him towards various forms of speculative investment. He had had better success for a time as the principal partner of the publishing house of Charles L. Webster and Company which reaped immense profits from the *Memoirs of General Grant,* the *Life of Pope Leo XIII.,* and other works of great popular interest, although this firm also failed and left him with heavy debts. Meanwhile he had published *A Con-*

necticut Yankee at King Arthur's Court (1889) and *The American Claimant* (1892), which were followed in 1894 by *The Tragedy of Pudd'nhead Wilson,* a story set in the Mississippi valley and containing much of the cynical philosophy that had become characteristic of its author.

In 1891 Clemens went abroad again, and, after spending a winter in Berlin, settled in Florence, where he wrote his *Personal Recollections of Joan of Arc,* a book for which, as he later declared, he had spent 14 years in preparation, and which he published anonymously, observing to his wife that it meant more to him than anything he had ever undertaken, and that it would never be accepted seriously over his own signature. After spending two years at home, he set out, with the purpose of earning money to pay off his debts, on the journey round the world recorded in *Following the Equator,* lecturing on the way in Australia and India. Returning home in 1900, he settled in New York, and during this year a collected edition of his works in 22 volumes was issued by the American Publishing Company of Hartford. He had published in 1897 a volume of miscellaneous essays entitled *How to Tell a Story;* and his further works included *The Man that Corrupted Hadleyburg* (1900), *The Double-Barrelled Detective Story* (1902), *Adam's Diary* (1904), *What is Man?* (privately printed, 1906), *Christian Science* (1907), *Captain Stormfield's Visit to Heaven* (1907) and *Is Shakespeare Dead?* (1909).

By the beginning of the last decade of his life Mark Twain had become a world celebrity and undoubtedly the most conspicuous and picturesque figure in America. In the year 1902 he made his spectacular return to the home of his childhood in Missouri, and in 1907, after having received honorary degrees from Yale and the university of his native state, he went to England to receive the degree of Doctor of Literature at Oxford. In 1906 he had built a country-house, "Stormfield," at Redding (Conn.), which became his home during the remaining years of his life, and there, shortly before he died, his daughter Clara, the only one of his four daughters who survived him, was married to the pianist Ossip Gabrilowitsch. His posthumous works comprise *The Mysterious Stranger* (1916), *What is Man? and Other Essays* (1917), *Mark Twain's Speeches* (1923), and two volumes of *Autobiography* (1924).

Mark Twain will always undoubtedly be regarded as the most characteristic American writer of his epoch. The first to represent the transition of the literary hegemony of the country from New England to the West, he was typical of the new democracy in his contempt for authority and for the sublimities as well as the commonplaces of 19th-century culture. He was most widely popular in his own day as a humorist, but he will survive rather as the master folk-writer of the pioneering epoch who has left in *Roughing It* and *Life on the Mississippi* unrivalled pictures of the character and manners of the Middle and Far West in Civil War days, and in *Tom Sawyer* and *Huckleberry Finn* a veritable epic of that primitive civilization, poetic in feeling, strictly veracious in detail, abounding in colour, and, in the latter book especially, with a grasp of life that can only be described as classical.

The standard biography of Mark Twain is by Albert Bigelow Paine (in three volumes, 1912). (V. W. B.)

TWAY-BLADE (*Listera*), a genus of small plants of the orchid family (Orchidaceae). The flower is green, with a downwardly directed, forked labellum. Two species, the common tway-blade (*L. ovata*) and the heart-leaved tway-blade (*L. cordata*), are found in the British Isles, the last named occurring also in North America, where three other tway-blades are also native,—the broad-lipped (*L. convallarioides*), the southern (*L. australis*) and the western (*L. caurina*). For fertilization mechanism *see* C. Darwin, *Fertilization of Orchids.*

TWEED, WILLIAM MARCY ("Boss"), American politician and leader of the "Tweed Ring," was born in New York City Apr. 3, 1823. In 1852 he was elected an alderman of the New York City council. From 1854 to 1856 he served as U.S. Representative in Washington. His real power in municipal politics began in 1857 with his election to the board of supervisors, which he came to dominate. By working the downfall of Fernando Wood, a notoriously corrupt mayor, Tweed came into power under a cl respectability. He fortified himself through his political ap ments. From 1858 to 1871, while holding successively th tions of school commissioner, deputy street commissioner, Senator and deputy commissioner of public works, Tweed, for brief intervals, controlled the city administration. In 1 also controlled the State Democratic Assembly at Albany, 1869, though he lost the Assembly, he secured the election nominee as governor. The "Tweed Ring" of history, compo Tweed, Mayor A. Oakey Hall, Peter B. Sweeny and Rich Connolly, began its operations in Jan. 1869 and lasted Tweed's downfall in 1871. Conservative estimates pla amount stolen directly from the city during this period at $4 000, though including taxes lost through arbitrary reducti the "ring" for money or favor and the issuance of bonds travagant rates of interest some authorities have estimated as $200,000,000. Exposure came through a book-keepe placed evidence in the hands of the New York *Times* where printed. Tweed was tried, found guilty and sentenced to 12 in the penitentiary. In 1875 he escaped from the Ludlow gaol where he was confined, fled to Cuba and thence to where he was arrested by the Spanish Government and retur the United States. He was again imprisoned in Ludlow Stre where he died Apr. 12, 1878.

See D. Lynch, *"Boss" Tweed* (1927).

TWEED, a river in the south of Scotland. It rises south-west corner of Peeblesshire, in the hill country in whi Clyde and Annan also rise. The stream flowing from T Well, about 1,500 ft. above the sea, is generally regarded source. For the first 36 m. of its course the stream inte the shire of Peebles in a north-easterly direction, and then, ing towards the south-east, passes Innerleithen, where it re the Leithen (left) and the Quair (right). It then crosses S shire and, having received the Ettrick on the right, flows ward past Abbotsford, forming for about 2 m. the bounda tween the counties of Selkirk and Roxburgh. After receivi Gala on the left, the Tweed crosses the north-western cor Roxburghshire past Melrose and, after being joined by the L on the left, winds past Dryburgh abbey round the south-w corner of Berwickshire. The remainder of its course is north-easterly direction through Roxburghshire past Kelso, it receives the Teviot on the right, and then between the ties of Berwick and Northumberland, past Coldstream, t town of Berwick, where it enters the North sea. The last of its course before reaching Berwick are in England.

The Tweed is 97 m. long and drains an area of 1870 s miles. Its bed is pebbly and sandy, and notwithstanding disc tions from manufactures, the stream, owing to its clear and s ling appearance, still merits the epithet of the "silver Tw

TWEED, a term of very general application in the w and worsted trades. It is employed as a trade description very large variety of woollen and worsted fabrics that embo same general textural features, but which differ in the min tails of their manufacture, construction and finish. The described as "Scottish," "Harris," "Cheviot," "Irish," "Yorks "Saxony" and "West of England" tweeds, according to the ticular locality of their origin, the yarn used in their constru their character of structure, texture, finish and other detail

The description of this particular variety of worsted f as "Tweeds" is commonly, but erroneously, associated wit Scottish river of that name. The origin of the word "tweed" ever, has no reference to the river Tweed, but is said to be a an error on the part of a London clerk who, in the year 1826, writing out an invoice for these goods, inadvertently wro word "tweeds" instead of "tweels," the Scottish for "twills." ders were placed for more "Scottish tweeds"—a novel descr which immediately won the popular favour and became established in the clothing trade as a brand of quality.

The chief characteristic feature of the true type of "t fabrics in general is, as the name suggests, their construction twill weave basis, although they are not restricted entirely t simple regular twill weave structures, as many tweed fabri

ed on the numerous modifications of those weaves. Tweed rics are produced from Scottish, Cheviot, Saxony and many er types of worsted and woollen yarns of various counts and llity, and woven in solid colours, mingled "heather" tones, and ured stripes and checks in endless variety of pattern and col-, and in every variety of texture suitable both for men's and nen's clothing for outer wear, and for every season of the year. Herring-bone" twills, "diamonds," "chevrons," "cross-twills" "basket" weaves are popular styles for tweed designs, which now more of a broken character than formerly, while more icate patterns are introduced in textures of superior quality. A vogue of quite recent origin consists of printed tweed effects n the pattern printed on both sides of the fabric to give the ression of woven designs. These printed tweeds are executed n such realistic effect that it is in some cases very difficult with- close inspection to distinguish the printed imitation tweed ct from the genuine woven tweed patterns. (H. N.)

WEEDDALE, JOHN HAY, 2ND EARL and 1ST MARSS OF (1626–1697), was son of John, 8th Lord Hay of Yester 1599–1654), created earl of Tweeddale in 1646. Before succling to the peerage in 1654 the second earl fought for Charles luring the Civil War, but he was in the Scottish ranks at rston Moor. Changing sides again, he was with the royal- at Preston; but he was a member of Cromwell's parlia- it in 1656, and was imprisoned just after the restoration Charles II. He was soon, however, in the king's favour, and in 3 was appointed president of the Scottish council, and in 1664 extraordinary lord of session. In Scotland he sought to miti- e the harshness shown by the English Government to the venanters, and for this attitude he was dismissed from his ces in 1674; but he regained an official position in 1680 and l it during the reign of James II. A supporter of William of nge, he was made lord high chancellor of Scotland in 1692, two years later was created marquess of Tweeddale and earl Gifford. He favoured the scheme for the expedition to Darien, as lord high commissioner during William's absence he forly assented to the act establishing the trading company in 5; for this action he was dismissed from office when the king rned to England in 1696. He died on Aug. 11, 1697.

WELVE TABLES, the tables of wood on which was en- ed or painted the earliest codification of the Roman law. ginally ten in number, two others were afterwards added, con- ing supplemental matter, and the whole code was termed the *XII. Tabularum* (Law of the Twelve Tables). (*See* ROMAN and ROME.)

WENTY-FOUR PARGANAS, THE, a district of Brit- India, in the presidency division of Bengal, with an area of 6 square miles. Pop. (1921), 2,628,205. It occupies part of Gangetic delta, east of the Hugli, surrounding (but not in- ing) the city of Calcutta. It also includes the greater part he almost uninhabited Sundarbans (*q.v.*), so that within its ines are found virgin forest, settled tilth and the busy life of suburb of a great city. The administrative headquarters are Alipur, a southern suburb of Calcutta. The country consists the most part of an alluvial plain with a population devoted agriculture and almost entirely rural, but a chain of indus- towns stretches along the bank of the Hugli from Gar- Reach northwards. Rice is the staple crop, followed by , pulses and sugar-cane. The riparian strip is crowded with ns, factories and mills; Bhatpara has 65,609 and Titagarh 51 inhabitants. Other industrial towns are Baranagar, Budge- ge, Naihati, Kamarhati, South Dum-Dum and Kanchrapara, he last of which are the works of the broad gauge system of Eastern Bengal State railway. In other towns various manu- ures are to be found, principally jute mills and jute presses, also, at Dum-Dum, Government factories for rifles.

WICKENHAM, an urban district in the Twickenham par- entary division of Middlesex, England, 12 m. west-south- of St. Paul's Cathedral, London, on the river Thames. Pop. 21) 34,790. Its situation is pleasant, and it has grown into extensive residential district. The body of the church of St. Mary was rebuilt in brick after its collapse in 1713, but the Perpendicular tower remains. Among men of eminence buried here are Alexander Pope and Sir Godfrey Kneller. The Thames in this neighbourhood forms a long deep reach in favour with fishermen, and Eel Pie Island is a resort of boating parties. There are many fine houses in the vicinity, more than one possessing historical associations. Strawberry Hill, the residence of Horace Walpole, was built to his taste in a medley of Gothic styles. Marble Hill was erected by George II. for the countess of Suffolk, and Pope, Swift and Gay took part in its equipment.

Orleans House was the residence in 1800 of Louis Philippe, then duke of Orleans, and this family again acquired it in 1852, when it was occupied by the duke of Aumale. Several eminent French refugees resided at this period in the neighbourhood. York House was given to Lord Clarendon by Charles II., was probably the occasional residence of James II. when duke of York, and in 1864 was occupied by the comte de Paris.

Twickenham at the Domesday survey was included in Isleworth. Anciently it was called Twittenham or Twicanham, and the first form, or a variation of it, is used by both Pope and Walpole. The manor was given in 941 by King Edmund to the monks of Christ Church, Canterbury, from whom it had been previously taken, but it was again alienated, for it was restored to the same monks by Edred in 948. In the reign of Henry VIII. it came into the possession of the Crown, and by Charles I. was assigned to Henrietta Maria as part of her jointure. In 1670 it was settled for life on Catherine of Braganza, queen of Charles II. It remains in possession of the Crown, but since the death of Catherine has been let on leases. The old manor house, now demolished, was Catherine's residence; and had been, according to tradition, the place of the retirement of Catherine of Aragon after her divorce from Henry VIII.

TWILIGHT, the interval during which the atmosphere is illuminated after sunset; formerly known as *crepusculum,* Lat. for dusky or obscure. The analogous early morning phenomenon is known as the *dawn* (*q.v.*). These phenomena are caused by the intervention of the atmosphere between the sun and the earth's surface. An entire absence of atmosphere would cause darkness to set in sharply at sunset as on the moon; but under present conditions even when the sun is some distance below the horizon the upper layers of air are illuminated and are reflecting light. Even as early as the 11th century the duration of twilight was determined as ending when the sun had "travelled" 18° below the horizon and subsequent observations have not materially modified the figure.

This quantity, 18°, has been made the measure for the interval between sunset or sunrise and "complete" darkness, and is termed *astronomical twilight;* but during a large part of this interval the light is insufficient for ordinary employments, consequently a shorter period, *civil twilight,* is also recognized for which the quantity is about 6°, but it is conditioned by the amount of light still available. The duration in each case is dependent on the latitude of the observer and the season of the year. The intensity of illumination depends to a considerable extent on the amount of atmospheric cloud and dust. Twilight after the sunsets of 1883–85 was frequently intense on account of the reflection from the extra dust in the higher layers of the atmosphere as a result of the eruption of Krakatoa.

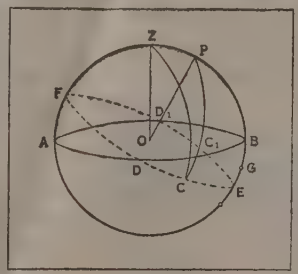

FIG. 1

The duration and possibility of *astronomical twilight* may be geometrically exhibited as follows: let O be the position of the observer; Z the zenith; P the pole of the heavens; ADB, the plane of the horizon; FDE, the path of the sun. Let the circles ADB and FDE intersect in the points D and D_1 which thus correspond to sunrise and sunset. Astronomical twilight prevails during the period between the sun's position on the horizon and when it is 18° below the horizon; the arcs ZC and ZC_1 equal

108°, and terminate on the circle FDE at C and C_1, then the arcs DC and D_1C_1 represent the distance to be traversed by the sun during twilight and the arc C_1EC represents the sun path during "complete" darkness, and DFD_1 its path during the "day." To calculate CD, join CP by an arc of a great circle, then in the triangle ZPC, ZP=the colatitude of O; PC=the sun's polar distance and ZC=108°. The angle ZPC, the sun's hour angle, then gives the time before or after noon when the sun passes C or C_1. The times of sunrise and sunset being known, the duration of dawn and twilight is a matter of simple subtraction. This represents the problem when the sun does attain a depression of 18°, but this depression may not be attained. Take ZG equal to 108°. Now if G lies beyond B and E (the maximum depression of the sun), E being also below B, then the sun will rise and set, but never descend so low as to occasion "complete" darkness and the entire interval between sunset and sunrise will be twilight.

If E be not below B but above it, the sun will never descend below the horizon, *i.e.*, will neither rise nor set, and so will give the phenomenon known as the *midnight sun.* Since the new PE=90°−sun's declination, and PG=latitude of observer+18°, then for there to be "complete" darkness the latitude of the observer together with the declination of the sun must exceed 72°. The maximum declination of the sun is about 23° 30′, and hence in latitude 72°−23° 30′=48° 30′ there will be one day without a true night; in higher latitudes there will be an increasing number of such days; and in lower latitudes none. In mid-England there is no real night from about May 22 to July 22. To calculate the duration of *civil twilight* ZC and ZC_1 are made equal to 96° and the argument then proceeds as above.

TWILIGHT SLEEP: *see* SCOPOLAMINE.

TWILL, a woven cloth in which the passage of the weft is arranged, not in regular succession as in plain weaving, but over one thread and under two or more according to the kind of twill. This gives a succession of diagonal lines to the cloth, and though in the normal type of twill this diagonal traverses from selvage to selvage at an angle of 45°, considerable variations may be made.

TWIN FALLS, a city of southern Idaho, U.S.A., on the Snake river plateau, 40 m. from the Nevada State line; the county seat of Twin Falls county. It is on Federal highways 30 and 93 and the Oregon Short Line of the Union Pacific railway system. Pop. (1920) was 8,324—93% native white; 1928 estimate, 10,400. It is a trading and shipping point for a fertile irrigated region (706,000 ac. within 50 m.), producing chiefly live stock, dairy and agricultural products. The city has large wholesale and commission houses, bonded warehouses, several farmers' co-operative associations, flour mills, creameries, a fruit dehydrating plant and other manufacturing industries, converting farm products into less bulky form. There are many points of interest in the immediate vicinity. The black lava canyon of the Snake river is spanned 2½ m. N. of the city, by a bridge 476 ft. above the water and 1,400 ft. long (completed in 1927). The falls from which the city and county take their name are divided into two parts by a huge mass of black lava in the middle of the river bed.

TWINS AND TWINNING. That human twins are of two kinds is now well established. Most mammals regularly or occasionally bear several young at a litter, and these are taken to arise from as many eggs matured together and ready for fertilization at one heat. Human twins of this kind are derived from two distinct eggs. In the nine-banded armadillo (*Dasypus novemcinctatus texanus*) and related species, on the other hand, a totally different cause of multiple births has been found. A single embryo is found at a certain early stage to divide and subdivide into four parts, which develop severally into four distinct offspring. In addition to producing two-egg twins the human race produces also a considerable proportion of twins derived from a single egg in a manner probably analogous to the armadillo. Man is the only mammal known to produce both kinds.

In most civilized countries account is taken of multiple births in official birth registration. These official records show approximately one in 100 twin births, one in 10,000 triplets and one in 1,000,000 quadruplets. The exact proportions vary from place to place and from period to period, but owing to the higher pr portion of premature and still-births, and to variability in the ra of survival and in the completeness of registration, it is not pos ble safely to make international comparisons of frequency, or discover whether the frequency is increasing or decreasing. T mortality at and soon after birth increases rapidly with increa ing number born. A recent British enquiry shows that of tripl children, about half the girls and three-eighths of the boys su vive; the chance of life of quadruplets is much lower. Five a even six at birth have been authentically recorded.

Sex Distribution.—Twins are more frequently of like than unlike sex. Extensive counts extending over more than 100,0 cases show that twins are of unlike sex in nearly three cases o of eight. From such counts an estimate may be made of the fr quency of one-egg twins, for these should never be of unlike se while of the two-egg twins half may be expected to be so. Sin in fact three-eighths are of unlike sex, it may be inferred th three-quarters must be two-egg twins.

Very exceptionally twins are joined at birth; such junctions a said to be effected always between like parts, with respect to whi the twins are placed symmetrically. Superficial unions are easi severed at birth. More deeply united pairs seldom survive, thou a few such have become celebrated for their peculiarity. Join twins usually exhibit an abnormal disposition of the blood-vesse known as *situs inversus,* in which the normal differences betwe the right and left sides of the body are in one twin at least pa tially reversed. This condition is not found in separate one-e twins. Joined twins are always of the same sex, and eviden points to their being always one-egg twins in which fission has r mained incomplete. That separate one-egg twins show symmet reversal of palm and finger pattern has not been establishe

At birth an expert can distinguish one-egg from two-egg twi by an examination of the foetal membranes in the afterbirth. the first type the *chorion* is believed always to be single, in t second double. Although earlier accounts of the proportion the two conditions showed serious discrepancies, the data fro more modern examinations agree well with the proportion judg to be single-egg twins from the sex distribution.

Degree of Resemblance.—In characters wholly determine by heredity one-egg twins should be exactly alike, whereas tw egg twins should show a degree of resemblance no greater tha that between brothers and sisters by different births. When it b came realized that the differences between the physical measur ments of ordinary brothers and sisters were principally due heritable differences, and that the degree of resemblance betwe these or other pairs of relatives could be measured statistically, a tempts were made to collect measurements of twins. The im portance of such attempts was great, both in putting to a decisiv test the theory of human twinning, and in exploiting the dire light which one-egg twins should throw on the heritability different characters. The discrepancies of the earlier collectio emphasize the fact that severe statistical precautions are nece sary to obtain sufficiently reliable data. (1) The accuracy of t individual measurements should be controlled by independe duplicate measurements. (2) The selection of cases for measur ment must rigorously exclude any preference for pairs showi striking resemblance or difference. (3) Incorrect allowance f growth with age will disturb the accuracy of the results, and sufficiently correct allowance is difficult to ascertain; this is be overcome by measurements at a fixed age.

Though often puny at birth, twins and triplets measured ages of six years and upwards show no appreciable retardation growth; even triplets are not infrequently well-grown at birt and the same is occasionally true of quadruplets (fig. 1). Mode collections of measurements, in which the precautions set o above have been increasingly observed, demonstrate (1) that twi and triplets of unlike sex show resemblance in physical measur ments equal to that observed between brothers and sisters by di tinct births (correlation about 0·5), (2) that pairs of like sex a on the average much more closely alike (correlation about 0·73 (3) that pairs of like sex are heterogeneous in their resemblanc and can be interpreted as a mixture of two groups, one with co

BY COURTESY OF (1, 2, 3, 4) GUNNAR DAHLBERG FROM "TWIN BIRTHS AND TWINS FROM AN HEREDITARY POINT OF VIEW," (5) THE AMERICAN GENETIC SOCIETY; PHOTOGRAPH, (6) COPR. F. M. KEYES

FULL FACE AND PROFILE VIEWS OF TWINS

Twins are characterized as uniovular or biovular. Generally speaking, uniovular twins are usually of the same sex and nearly identical, but if biovular, they merely resemble one another as brothers and sisters do, and often are of opposite sex

1, 3. Full face and profile views believed to be biovular

2, 4. Full face and profile views of twins believed to be uniovular. Likeness closer than in figs. 1, 3

5. Triplets believed to be uniovular

6. Quadruplet daughters. In this case the father was one of 12 children, among whom was one pair of twins. There was no record of twins on the mother's side. If the explanation for the appearance of the quadruplets be sought in heredity, it is attributable most probably to the father rather than to the mother

ion about 0·5, who may be regarded as two-egg twins, and other with correlation 0·93, presumably one-egg twins; the r from between 50 and 60% of both the twin and triplet data ured. The exceedingly high correlation indicates that the ical dimensions of the head, trunk and limbs in man are ormal conditions only influenced to about 7% of the total tion by other than heritable causes.

eredity of Twinning.—That the relatives of twins have s somewhat more frequently than the general population has observed by many writers; satisfactory records are, how- rare. Comparison cannot safely be made between the fre- cy in a selected group as recorded in reply to enquiries, and obtained from official birth registrations. It is possible, how- to demonstrate inheritance by comparing the twin frequency o groups of parents, one more and the other less closely re- to the original twin parents. It is of the greatest importance e collection of statistical data of this kind that the method of tion should not admit in undue proportion those striking of apparent inheritance often brought to the notice of the tigator. It is best to attempt to enumerate every case in a mscribed district, or group of families, in a chosen interval me. When these precautions are taken it is found that an s of twins certainly occurs, both on the father's and on the er's side of the family; the influence on the father's side , in the material collected by the writer, apparently con- to the production of one-egg twinning. The production of gg twins seems thus to be influenced only by the mother, depends greatly upon her age. The frequency increases at three-fold from the age of 18 to that of 38, and is also prob- influenced by inherited qualities. The frequency of one-egg ning depends on the inheritance of the father, and probably on that of the mother, but it is not known to be influenced ge or environmental factors.

BLIOGRAPHY.—The best general book for all but the most recent is G. Dahlberg, *Twin Births and Twins from a Hereditary Point iew* (1926); other important books and papers are F. Galton, *ries into Human Faculty and its Development* (London, 1893); Patterson, *Journ. of Morph.* (1913); G. H. Knibbs, *The Mathe- al Theory of Population* (Melbourne, 1917); H. H. WO-STEP, a modern round dance in which the partners rm a series of sliding steps in $\frac{2}{4}$ time. The first step of each ure, or the slide, is longer than the second. (*See* also DANCE.)

WYSDEN, SIR ROGER (1597–1672), English antiquary royalist pamphleteer, was educated at St. Paul's school, on, and then at Emmanuel college, Cambridge. He entered 's Inn on Feb. 2, 1623. He succeeded to the baronetcy on ather's death in 1629. For some years he remained on his e at Roydon, East Peckham, largely engaged in building lanting, but also in studying antiquities and the law of the itution. He took the most prominent part in preparing the ish petition of March 1642 and in subsequent demonstrations half of Charles. He incurred the wrath of the parliament, rrested on April 1, 1642, but was soon let out on bail, and s promise to keep quiet. But his respect for legality would t him rest, and he was repeatedly in trouble with the parlia- until 1650, when he compounded and went home. He lived y there till the Restoration, when he resumed his position agistrate. He died on June 27, 1672. He published *The nons' Liberty* (1648), demonstrating that finings and im- nings by parliament were illegal; *Historiae anglicanae scrip- decem* (1652), a work encouraged by Cromwell; and *His- l Vindication of the Church of England* (1657).

YBURN, a left-bank tributary of the Thames, England, having its course entirely within London and below ground. ame, which also occurs as Aye-bourne, is of obscure deriva- though sometimes stated to signify Twy-burn, *i.e.* (the ion of) two burns or streams. The Tyburn rose on the south- lope of the Hampstead heights in two streams, the more rly of which rose in the spring known as the Shepherd's Well. It ran south, crossing Regent's Park, its course being marked by Regent's Park Water, and further south by the windings of Marylebone Lane and the dip in Piccadilly near the junction of Half Moon street. It then crossed the Green Park and entered the flood plain of the Thames near where Buckingham palace now stands. The exact point at which it entered the Thames is doubtful but its water is now drained off by sewer. After 1238 it supplied the city with water for a long time by means of nine conduits. The name is more famous in its application to the Middlesex gallows also called Tyburn Tree and Deadly Never Green, and also at an early period, the Elms, through confusion with the place of execution of that name at Smithfield.

The Tyburn gallows stood not far from the modern Marble arch. Connaught square is said by several authorities to have been the exact site, but it appears that so long as the gallows was a permanent structure it stood at the junction of the present Edgware and Bayswater roads. The site, however, may have varied, for Tyburn was a place of execution as early as the end of the 12th century. In 1759, moreover, a movable gallows superseded the permanent erection. On some occasions its two uprights and cross-beam are said to have actually spanned Edgware road. Round the gibbet were erected open galleries, the seats in which were let at high prices. Among those executed here were Perkin Warbeck (1449), the Holy Maid of Kent and confederates (1535), Haughton, last prior to the Charterhouse (1535), John Felton, murderer of Villiers, duke of Buckingham (1628), Jack Sheppard (1724), Earl Ferrers (1760).

In 1661 the skeletons of Cromwell, Ireton and other regicides were hung upon the gallows. The last execution took place in 1783, the scene being thereafter transferred to Newgate. The Tyburn Ticket was a certificate given to a prosecutor of a felon on conviction, the first assignee of which was exempted by a statute of William III. from all parish and ward duties.

See A. Marks, *Tyburn Tree, its History and Annals* (London, 1908).

TYDEUS, in Greek legend, son of Oeneus, king of Calydon, and Periboea. Having slain his uncle (or other relatives) he fled for refuge to Argos, where Adrastus purified him and married him to his daughter Deipyle, who became the mother of Diomedes (*q.v.*). In the expedition of the Seven (*cf.* OEDIPUS), Tydeus, who had fought valiantly, was mortally wounded by Melanippus. Having killed Melanippus, he proceeded to devour his head; this so disgusted Athena, who had meant to make him immortal, that she left him to die.

See Roscher's *Lexikon*, art. "Tydeus."

TYLDESLEY with **SHAKERLEY,** an urban district of Lancashire, England, 10 m. W.N.W. from Manchester. Pop. (1921) 15,650. The town, of modern growth, depends on cotton mills and collieries.

TYLER, JOHN (1790–1862), tenth President of the United States, was born at Greenway, Charles City county, Virginia, on March 29, 1790. He was the second son of John Tyler (1747–1813), of English descent, governor of Virginia in 1808–11 and U.S. district judge in 1812–13. John Tyler the younger entered the grammar school of the College of William and Mary, at Williamsburg, in 1802, and graduated at the college in 1807. Two years later he was admitted to the bar. His public life began in 1811, when he was elected a member of the Virginia house of delegates. Here he served for five years, being chosen also in 1815 a member of the council of State. In 1813 he raised a company for the defence of Richmond against the British, but his command was not called into action and his military service was concluded after a month. From Dec. 1816 to March 1821 he was a member of the National House of Representatives. Believing firmly in the republican principles of Jeffersonian democracy, he opposed the demand for internal improvements and increased tariff duties. He declined to follow Henry Clay in the proposed recognition of the independence of the Spanish colonies in South America and in the Missouri Compromise legislation, and he condemned Jackson for his execution of Arbuthnot and Ambrister in Florida. He declined re-election to the House in 1821 because of ill-health. In 1823–25 he was again a member of the Virginia house of delegates, and in 1825–27 was governor of the State. In 1827 he was sent

to the U.S. Senate to succeed John Randolph, after having been unanimously re-elected governor. In 1829–30 he also served as a member of the Virginia Constitutional Convention. His career as senator was marked by great independence of party, for his political ideas continued to be those of a thoroughgoing "strict-constructionist." Believing protective tariff duties to be unconstitutional, he voted against the "tariff of abominations" in 1828, and also against the tariff of 1832; but the compromise tariff of 1833, made necessary by the hostile attitude of South Carolina, owed its inception largely to him. His hostility to a high tariff policy, however, did not prevent his condemning the South Carolina ordinance of nullification; and in the presidential election of 1832 he supported Andrew Jackson, to whose political principles and methods he was invincibly opposed, as the "least objectionable" of the various candidates. His opinions never changed, though he aligned himself with parties as they developed. In this way he became a Whig (1833), but agreed with the Democrats on State's rights and differed from them on nationalism. He sought to incorporate in a new code for the District of Columbia, in 1832, a prohibition of the slave trade in the district, at the same time opposing the abolition of slavery there without the consent of Maryland and Virginia, which had originally ceded the district to the United States. In the controversy over the removal of the Government deposits from the Bank of the United States he sided with the bank. In 1833 he was again elected to the Senate, notwithstanding the criticism of his independent attitude and the wide approval of Jackson's policy in regard to the bank. In the election of 1836 he was supported as a candidate for the vice presidency by the friends of H. L. White of Tennessee, the Democratic candidate opposed to M. Van Buren, and received 47 votes, none of them from Virginia. When the legislature of Virginia instructed its senators to support Benton's expunging resolution, Tyler, admitting the right of instruction, could not conscientiously obey, and on Feb. 29, 1836, he resigned his seat. In 1838 he became once more a member of the Virginia house of delegates, and was chosen president of the Virginia colonization society, of which he had long been a vice-president. In 1839 he made an unsuccessful contest for the U.S. senatorship. In December of that year the Whigs nominated W. H. Harrison for President and Tyler for vice-president without issuing a platform. Tyler was nominated with the expectation that he would carry the South, and in the belief that his senatorial record was a declaration of principle. Harrison and Tyler each received 234 electoral votes and were elected. On April 4, 1841, one month after the inauguration, Harrison died, and Tyler became President. The detailed discussion of the events of his administration, 1841–45, belongs to the history of the United States (*see* UNITED STATES: *History*).

He kept Harrison's cabinet until his veto of the bill for a "fiscal corporation," as being opposed to State's rights, led to the resignation of all the members except D. Webster, who was bringing to a close the negotiations with Lord Ashburton for the settlement of the north-eastern boundary dispute. Tyler opposed the recognition of the spoils system and kept at their posts some of the ablest of the ministers abroad. He stood, however, between the two great parties, without the support of either; Van Buren refused to recognize him as a Democrat, and the Whigs repudiated him, while, with Clay leading the majority in Congress, harmony between that body and the executive was from the first impossible. The annexation of Texas, achieved just before the close of his administration, seemed to commend him for a second term, and in May 1844 he was renominated by a convention of Democrats, irregularly chosen, at Baltimore. The majority of the annexationists, however, would not support him, and he had further to meet the opposition of Van Buren, who had failed to secure the nomination in the regular Democratic Convention, and of J. K. Polk, the regular Democratic nominee. Tyler accepted the Baltimore nomination, but on Aug. 20 withdrew from the contest. From this time until the eve of the Civil War he held no public office, but his opinions on political questions continued to be sought, and he was much in demand as a speaker on public occasions. In Dec. 1860 when South Carolina adopted its ordinance of secession, Tyler, though sympathizing with the State, took firm ground against disunion exerted himself on behalf of peace. The legislature of Virg appointed him a commissioner to confer with President Bucha and arrange, if possible, for the maintenance of the *status* in the matter of Ft. Sumter, in Charleston harbour; but efforts were unavailing. He was largely responsible for, and sided over, the Peace Congress which assembled at Washing on Feb. 4, 1861, pursuant to a resolution of the Virginia le lature. The constitutional amendment proposed by the con ence did not meet with his approbation, and his action in sig and transmitting the resolution to Congress was merely for On Feb. 13, while in Washington on this mission, he was ele to the Virginia Convention at Richmond, and took his seat March 1. In the convention he advocated immediate seces as the only proper course under the circumstances. He contin to serve as a member of the convention until it adjourned December, in the meantime acting as one of the commissio to negotiate a temporary union between Virginia and the federate States of America. He was a member of the provisi Confederate congress in May 1861, when the capital of the federacy was removed from Montgomery, Ala., to Richm and was elected a member of the House of Representative the permanent Congress, but died on Jan. 18, 1862, in Richm before that body assembled.

His son, LYON GARDINER TYLER (b. 1853), graduated at University of Virginia in 1875 and practised law at Richm Va., from 1882 to 1888, when he became president of the Col of William and Mary. Among his publications, besides *Le and Times of the Tylers*, are *Parties and Patronage in the Un States* (1890); *Cradle of the Republic* (1900); *England in Am ica* (1906), in the "American Nation" series, and *Williamsb the Old Colonial Capital* (1908).

The principal authority is Lyon G. Tyler, *Letters and Time the Tylers*, Richmond, Va. (1884–96). A good sketch of Tyle in *Virginia Portraits* (1924), by Armistead Gordon.

TYLER, MOSES COIT (1835–1900), American histo was born in Griswold (Conn.), on Aug. 2, 1835, but his hood was spent in Michigan. From his graduation at Yal 1857 until his death in Ithaca (N.Y.), on Dec. 28, 1900, he al nated between a desire for a life of service in the ministry a life of study. Although he attended the Yale and And theological schools, held pastorates at Owego and Poughkee (1859–62), and indulged in a couple of journalistic interlu his reputation was won through his professorships at Michi and Cornell universities and his publications, notably his *tory of American Literature during the Colonial Time, 16 1765* (1878, rev. 1897); *Literary History of the American olution, 1763–1783* (1897); *Three Men of Letters* (1895); *Patrick Henry* (1887), a sound and critical biography.

See tributes by W. P. Trent in the *Forum* (Aug. 1901) and J. W. Jenks in the *Michigan Alumnus* (March 1901). *Moses Tyler; Selections from His Letters and Diaries* (1911), by Jessic Austen, illuminates his personality and work.

TYLER, WAT (or WALTER) (d. 1381), English re was a native either of Kent or of Essex. Nothing definit known of him previous to the outbreak of the peasant revol 1381, but Froissart says he had served as a soldier in the Fre War. The name Tyler, or Teghler, is a trade designation and a surname. The discontent of the rural labourers and of poorer class of craftsmen in the towns, caused by the econo distress that followed the Black Death and the enactment of Statute of Labourers in 1351, was brought to a head by imposition of a poll tax in 1379 and again in 1381, and at end of May in the latter year riots broke out at Brentwood Essex on June 4, and at Dartford; on June 6 a mob sev thousand strong seized the castle of Rochester and marched the Medway to Maidstone. Here they chose Wat Tyler to their leader, and the rising spread over Kent. On the 10th T seized Canterbury, sacked the palace of Archbishop Sudbury, chancellor, and beheaded three citizens as "traitors." Next he led his followers, strengthened by many Kentish recruits, the road to London, being joined at Maidstone by John

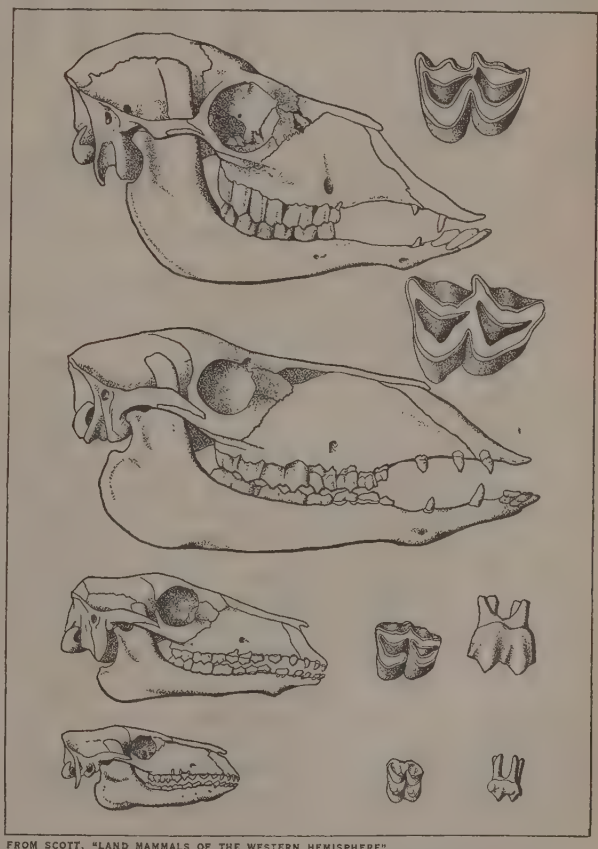
, whom the mob had liberated from the archbishop's prison. ning Blackheath on the 12th, the insurgents burnt the prisons uthwark and pillaged the archbishop's palace at Lambeth, another body of rebels from Essex encamped at Mile End. Richard II. was at the Tower, but neither the king's coun- s nor the municipal authorities had taken any measures to with the rising. The drawbridge of London Bridge having lowered by treachery, Tyler and his followers crossed the ues; and being joined by thousands of London apprentices, ns and criminals, they sacked and burnt John of Gaunt's lid palace of the Savoy, the official residence of the treas- Sir Robert Hales, and the prisons of Newgate and the

On the 14th Richard II., a boy of fourteen, rode out to r with the rebels beyond the city wall. At Mile End the met Wat Tyler; Tyler demanded the immediate abolition rfdom and all feudal services, and the removal of all re- ions on freedom of labour and trade, as well as a general sty for the insurgents. Charters were immediately drawn give effect to these demands. Meanwhile Tyler with a small of followers returned to the Tower, and dragged forth Arch- Sudbury and Sir Robert Hales from the chapel and mur- them on Tower Hill. During the following night and day on was given over to plunder and slaughter. Meantime the e of property began to organize themselves for the restora- of order. On June 15 Richard rode to Smithfield for a er conference with the rebels. Wat Tyler advanced from anks of the insurgents and shook the king's hand, bidding e of good cheer. Tyler then formulated a number of fresh nds, including the confiscation of ecclesiastical estates and stitution of social equality. Richard replied that the popular should be satisfied "saving the regalities of the Crown." thereupon grew insolent, and in the altercation that ensued illed by the mayor, Sir William Walworth (*q.v.*), and John wick, one of the king's squires. The enfranchisement of ns granted by Richard at the Mile End conference was ed by parliament in 1382, and no permanent results were ned for the peasants by Wat Tyler's revolt.

LIOGRAPHY.—The best original account of the rebellion of Wat is the "A nominalle Chronicle of St. Mary's, York," printed M. Trevelyan in the *Eng. Hist. Rev.* (1898). *See* also Thomas ngham, *Chronicon Angliae* (Rolls series, 1874); Froissart, *Chron-* edited by G. C. Macaulay, London, 1895); André Réville, *Le vement des travailleurs d'Angleterre en 1381* (1898); C. Oman, *reat Revolt of 1381* (Oxford, 1906), and *The Political History of nd*, vol. iv. (ed. by W. Hunt and R. L. Poole, 1906).

TLER, a city of N.E. Texas, county seat of Smith county. (1920) 12,085 (23% negroes), estimated locally at 20,000 28. The city lies 558 ft. above sea-level, between the Sabine Neches rivers, surrounded by farmlands, five lakes and s of forest. Pecans, fruits, berries, vegetables and cotton ne leading crops. Large nurseries specialize in pecan trees ose plants. Since 1925 the city has had an ample supply of al gas, and oil was discovered 30 m. S. in March, 1927. The school system includes a junior college. Tyler Commercial ge (1899) trains over 4,000 students in a year. The industries n output in 1925 of $2,197,539. Since 1916 the city has ted under a commission-manager form of government. The Texas Fair is held here in September. Tyler was laid out e county seat in 1846, and was named after President Tyler. s incorporated as a town in 1870; grew rapidly when the first ay reached it in 1871; and was chartered as a city in 1907.

YLOPODA, a section of ruminant cloven-hoofed mammals (ARTIODACTYLA) including the single family Camelidae, of the Old World camels (*see* CAMEL) and the South Ameri- amas (*see* LLAMA) are the only living representatives. The anding distinctions of the Tylopoda are: (1) the retention e lateral incisors, canines and usually the first premolars as recurved laniary tusks; (2) reduction of the remaining pre- rs and narrowness of the molars; (3) the peculiar form of anic bulla, folded in upon itself and filled with cancellous ; (4) elongate cervical vertebrae and peculiar course of the ral artery, perforating the inner side of the pedicle of the instead of the transverse process as in all other mammals (except *Macrauchenia, q.v.*); (5) carpal and tarsal bones remain separate, the trapezoid and magnum never co-ossified, nor the cuboid and navicular, while the trapezium is reduced to a small nodule in Miocene and disappears in later genera, only the ecto- and mesocuneiform are consolidated; (6) fore and hind feet completely didactyl, the lateral pair of digits absent except for small vestigial splints or nodules in the early forms, the median pair long, slender, appressed in early stages, consolidated into a cannon-bone in all later Tertiary and modern Tylopoda; (7) the distal ends of metapodials remain separate and slightly divergent, the keels of their distal facets confined to the palmar surface and not extending over the dorsal surface as in the pecora; (8) phalanges flattened and widened in varying degree and the hoof correspondingly reduced and limited to the upper surface of the terminal phalanx, conformant with the development of a heavy cutaneous pad on the palmar surface, and a digitigrade rather than unguligrade gait. No horns or antlers are developed. The femur and humerus are relatively elongate and the thigh and upper fore-limb are more free from the flank than in other ruminants. Many features of the soft anatomy are peculiar to the



FROM SCOTT, "LAND MAMMALS OF THE WESTERN HEMISPHERE"

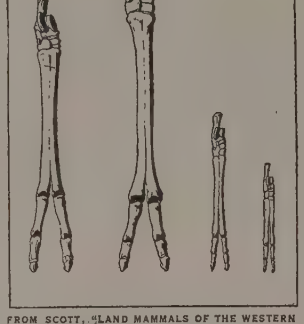
THE DEVELOPMENT OF THE SKULL AND MOLAR TEETH IN THE CAMEL

group; the absence of a distinct psalterium and presence of pockets for storage of liquid in the stomach; the diffuse placenta and the oval blood corpuscles are the most remarkable.

The modern camels and llamas are the remnants of a group which played an important part among the Tertiary mammals of North America, and in the Pliocene and Pleistocene found its way to South America, Asia, eastern Europe and northern Africa. Fossil camels have been found in the Pleistocene of Alaska, in the Pliocene and Pleistocene of China, Siberia and Russia, the Pleistocene of Rumania and of Algeria, all of them related to the modern camels, but the Pliocene species from China and Russia are in a more primitive generic stage (*Paracamelus*). In South America the fossil Camelidae are related to the llama

group, the older forms of late Pliocene and early Pleistocene more primitive in dentition (*Palaeolama*).

The ancestry of the camels is shown in North America by a very complete fossil record from Oligocene to Pleistocene, with more doubtful predecessors in the Eocene. The earliest stage is *Protylopus* of the Upper Eocene, about the size of a jack-rabbit. It has none of the characteristics of the Tylopoda well developed but is said to show them in a rudimentary stage. *Xiphodon* and other genera from the Upper Eocene of Europe have some claim to be associated with the Tylopoda.



FROM SCOTT, "LAND MAMMALS OF THE WESTERN HEMISPHERE"

RIGHT FOOT OF THE CAMEL

Poebrotherium of the American Oligocene is the first of the undoubted ancestral line of the camels. It is about as large as a sheep and the long neck and limbs, peculiar course of the vertebral artery, the characteristic form of the tympanic bulla and the structure of teeth and feet are unmistakably camelid. The dentition is complete, the anterior teeth are all incisiform in some species, in others the canines are small, recurved, spaced tusks. The feet are two-toed, the lateral digits reduced to nodules, the median pair elongate and appressed but not co-ossified into a cannon-bone, the distal facets like those of modern Camelidae, the phalanges, however, are not flattened and probably there were no heavy pads on the feet.

Oxydactylus of the Lower Miocene has the anterior teeth small recurved tusks, the vestiges of the lateral digits have disappeared or co-ossified, the median pair is more closely appressed and the size has increased to that of a llama or larger.

In *Protolabis* of the Middle Miocene the first and second upper incisors are reduced in size, the molar crowns are higher, and the metapodials are co-ossified to a varying degree in different species and at different ages. In *Procamelus* of the Upper Miocene the first and second upper incisors have disappeared, and the co-ossification of the metapodials is complete. Another side branch, *Alticamelus*, in the later Miocene and Pliocene differs from *Procamelus* in the long limbs and neck and relatively small head.

In the Pliocene follow a number of diverse genera incorrectly grouped under the name of *Pliauchenia*, and characterized by the loss of the second premolar in upper and lower jaw; but while they agree in this particular they differ widely in size, proportions, retention or loss of other teeth, height of molar crowns, etc. The best known is *Megatylopus*, probably identical with *Paracamelus* of the Chinese Pliocene, larger and more robust than the modern camel, with foot-pads less developed, but in most respects approximately ancestral. A group of smaller species, to which the name *Pliauchenia* may be found applicable, shows a similar approach to the llamas; a third group appears to be derived from *Alticamelus*, and a fourth parallels the Virginia deer in proportions (although not related).

In the Pleistocene the genus *Camelops* has lost the third lower premolar as well as $p\frac{2}{2}$, and $p\frac{3}{3}$ is much reduced; $p\frac{1}{1}$ is present or absent in different species. It is of about the size and proportions of the modern camels, but lacks the broadly flattened toes and probably had not much padding on the foot. Another genus, akin to the llamas but with longer cannon-bones, relatively smaller head and sometimes retaining $p\frac{1}{1}$, occurs in the Pleistocene of the southern and south-western United States.

It has been generally believed that the camels became extinct in North America in the older Pleistocene, but recent evidence shows that some at least survived in Nevada until almost recent times, and probably elsewhere in the south and south-west until late Pleistocene. The splitting up of the family into the camels proper and the llama group is clearly foreshadowed in the geographical distribution of the Pliocene and Pleistocene species, many of the south-western species showing more affinities to llamas, while those of the north-west are nearer to the cam The Alaskan species and the Chinese *Paracamelus* make a closer approach to the camel, and the Siwalik species is a typ *Camelus*. The Rumanian "*Camelus*" *alutensis* is, however, a branch with low-crowned molars, slender jaw and retaining related to one of the North American Pliocene groups. In So America *Palaeolama* of the early Pleistocene, while retaining second and third premolars like *Procamelus*, is quite llama- in details of molar construction, in characters and proportions skull and skeleton.

TYLOR, SIR EDWARD BURNETT (1832–1917), E lish anthropologist, was born at Camberwell, London, on Oct 1832, the son of Joseph Tylor, a brassfounder. Alfred Tylor, geologist, was an elder brother. His parents were members of Society of Friends, at one of whose schools, at Grove Ho Tottenham, he was educated. During 1855–1856 he travelled in United States to recruit his health. Proceeding in 1856 to C he met Henry Christy the ethnologist, with whom he vis Mexico. While on a visit to Cannes he wrote a record of observations, entitled *Anahuac; or, Mexico and the Mexic Ancient and Modern*, which was published in 1861. In 1865 peared *Researches into the Early History of Mankind*, which m Tylor's reputation. It showed great research, original ins and much constructive power in the formation of system views. The chapters on early myths and their geographical tribution are especially valuable. In 1871 he published *Primi Culture: Researches into the Development of Mythology, Ph sophy, Religion, Language, Art and Custom*, which at once bec the standard general treatise on anthropology. Tylor first de mined the limits of animism, intending it to include "the gen doctrine of souls, and other spiritual beings." In 1881 T published a smaller and more popular handbook on *Anthropol* In 1871 he was elected F.R.S., and in 1883 he became kee of the University museum at Oxford, and reader in anthropol in 1884. In 1888 he was appointed first Gifford lecturer at A deen university, and delivered a two years' course on "Nat Religion." In 1896 he became first professor of anthropolog Oxford. Knighted in 1912, he died on Jan. 2, 1917.

See *Anthropological Essays*, a volume dedicated and presente Tylor, which includes a bibliography of his publications by Freire-Marreco, and an appreciation of Tylor by Andrew Lang.

TYMPANON or **TYMPANUM**, a name applied by Romans to both kettledrum and tambourine. Pliny described pearls having one side round and the other flat as *tympa* In architecture the tympanum is the triangular space encl between any horizontal feature and any form of gable above Though sometimes left plain, in the most celebrated Greek tem it was filled with sculpture of the highest standard ever attai

TYNAN, KATHERINE (Hinkson) (1863–), Eng novelist and poet, was born in Ireland where she lived until marriage in 1893 to H. A. Hinkson, author and barrister. She p lished her first volume of verse, *Louise de la Vallière*, in 1 She is a prolific and versatile novelist and the author of m admirable children's books; she has written miracle plays, edited several anthologies. Her best work is in poetry, where expresses religious feeling and love of Ireland with tender and charm.

Her publications include: *The Land of Mist and Mountain* (189 *Miracle Plays* (1896); *The Handsome Brandons* (1896); *A Book Memory* (1906); *Irish Poems* (1913); *The Middle Years* (191 *Wives* (1924); *The Infatuation of Peter* (1926).

TYNDALE (or TINDALE), **WILLIAM** (*c.* 1492–153 translator of the New Testament and Pentateuch (*see* BIB ENGLISH), was born on the Welsh border, probably in Glouces shire, some time between 1490 and 1495. In Easter term 151 went to Oxford, where Foxe says he was entered at Magda

He took his M.A. degree in 1515 and removed to Cam-e, where Erasmus had helped to establish a reputation for r and theology. Ordained to the priesthood, probably to-s the close of 1521, he entered the household of Sir John h, Old Sodbury, Gloucestershire, as chaplain and domestic . Here he lived for two years, using his leisure in preach-the villages and at Bristol, conduct which brought him into ion with the backward clergy of the district, and led to his summoned before the chancellor of Worcester (William lvern) as a suspected heretic; but he was allowed to depart ut receiving censure or being given any undertaking.

anslation of the Bible.—But the persecution of the clergy im to seek an antidote for what he regarded as the corruption e Church, and he resolved to translate the New Testament the vernacular. In this he hoped to get help from Cuthbert tall, bishop of London, and so "with the good will of his mas-he left Gloucester in the summer of 1523. Tunstall dis-nted him, so he got employment as a preacher at St. tan's-in-the-West, and worked at his translation, living as ain in the house of Humphrey Monmouth, an alderman, orming a firm friendship with John Frith; but finding publica-impossible in England, he sailed for Hamburg in May 1524. visiting Luther at Wittenberg, he settled with his amanu-William Roy in Cologne, where he had made some progress inting a 4to edition of his New Testament, when the work discovered by John Cochlaeus, dean at Frankfurt, who not got the senate of Cologne to interdict further printing, but ed Henry VIII. and Wolsey to watch the English ports. Tyn-and Roy escaped with their sheets to Worms, where the 8vo on was completed in 1526. Copies were smuggled into Eng-but were suppressed by the bishops, and William Warham, ishop of Canterbury, even bought up copies on the Continent stroy them. Attempts were made to seize Tyndale at Worms, e found refuge at Marburg with Philip, landgrave of Hesse.

her Works.—About this time he changed his views on the arist and swung clean over from transubstantiation to the nced Zwinglian position. His *Parable of the Wicked Mam-* (1528), *Obedience of a Christen Man* (1528), in which the great principles of the English Reformation are set out, viz. uthority of Scripture in the Church and the supremacy of the in the state, and *Practyse of Prelates* (1530), a strong in-nent of the Roman Church and also of Henry VIII.'s divorce eedings, were all printed at Marburg. In 1529 on his way to burg he was wrecked on the Dutch coast, and lost his newly leted translation of Deuteronomy. Later in the year he went ntwerp where he conducted his share of the classic contro-with Sir Thomas More.

ter Henry VIII.'s change of attitude towards Rome, Stephen han, the English envoy to the Netherlands, suggested Tyn-s return, but the reformer feared ecclesiastical hostility and ned. Henry then demanded his surrender from the emperor e who was spreading sedition in England, and Tyndale left erp for two years, returning in 1533 and busying himself with ing his translations. In May 1535 he was betrayed by Henry ips, to whom he had shown much kindness, as a professing nt of the new faith. The imperial officers imprisoned him at rde Castle, the state prison, 6 m. from Brussels, where in of the great efforts of the English merchants and the appeal homas Cromwell to Archbishop Carandolet, president of the cil, and to the governor of the castle, he was tried for heresy ondemned. On Oct. 6, 1536 he was strangled at the stake and ody afterwards burnt.

ough long an exile from his native land, Tyndale was one e greatest forces of the English Reformation. His writings sound scholarship and high literary power, while they helped ape the thought of the Puritan party in England. His trans-n of the Bible was so sure and happy that it formed the basis bsequent renderings, especially that of the authorized version 11. Besides the New Testament, the Pentateuch and Jonah, believed that he finished in prison the section of the Old ament extending from Joshua to Chronicles.

side the works already named Tyndale wrote *A Prologue on the Epistle to the Romans* (1526), *An Exposition of the 1st Epistle of John* (1531), *An Exposition of Matthew v.–vii.* (1532), a treatise on the sacraments (1533), and possibly another (no longer extant) on matrimony (1529).

The works of Tyndale were first published along with those of John Frith (*q.v.*) and Robert Barnes, "three worthy martyrs and principal teachers of the Church of England," by John Day, in 1573 (folio). A new edition of the works of Tyndale and Frith, by T. Russell, was published at London (1828–1831). *His Doctrinal Treatises and Introductions to Different Portions of the Holy Scripture* were published by the Parker Society in 1848. For biography, *see* Foxe's *Acts and Monuments;* R. Demaus, *William Tyndale* (1871); also the Introduction to Mombert's critical reprint of Tyndale's Pentateuch (1884), where a bibliography is given.

TYNDALL, JOHN (1820–1893), British natural philosopher, was born in Co. Carlow, Ireland, on Aug. 2, 1820. Tyndall was to a large extent a self-made man; he was stimulated to earnest study by the writings of Carlyle. He passed from a national school in Co. Carlow to a minor post (1839) in the Irish ordnance survey, thence (1842) to the English survey, attending mechanics' institute lectures at Preston in Lancashire. He then became for a time (1844) a railway engineer, and in 1847 a teacher at Queenwood College, Hants. Thence with much spirit, and in face of many difficulties, he betook himself, with his colleague Edward Frankland, to the university of Marburg (1848–1851), where, by intense application, he obtained his doctorate in two years. His dissertation was an essay on screw-surfaces.

Tyndall's contributions to science are due more to his personality and his gift for making difficult things clear rather than to his original researches. He became known through some early magnetic investigations and was elected F.R.S. in 1852. In May 1854 he was chosen professor of natural philosophy at the Royal Institution, a post which exactly suited his striking gifts and made him a colleague of Faraday, whom in 1866 he succeeded as scientific adviser to the Trinity House and Board of Trade, and in 1867 as superintendent of the Royal Institution. His reverent attachment to Faraday is beautifully manifested in his memorial volume called *Faraday as a Discoverer* (1868).

With his friend Huxley he went to Switzerland to study the motion of glaciers; his views brought him into conflict with Forbes and James Thomson.

Tyndall's investigations of the transparency and opacity of gases and vapours for radiant heat, which occupied him during many years (1859–1871), are frequently considered his chief scientific work. (*See* HEAT.) But his activities were essentially many-sided. He definitely established the absorptive power of clear aqueous vapour—a point of great meteorological significance. He made brilliant experiments elucidating the blue of the sky, and discovered the precipitation of organic vapours by means of light. He called attention to curious phenomena occurring in the track of a luminous beam. He examined the opacity of the air for sound in connection with lighthouse and siren work, and he finally verified what had been already substantially demonstrated, viz., that germ-free air did not initiate putrefaction.

Tyndall's devotion to science for its own sake may be seen in his treatment of the money which came to him in connection with his successful lecturing tour in America (1872–1873). He placed the money amounting to several thousand pounds in the hands of trustees for the benefit of American science—an act of lavishness which bespeaks a noble nature. He took some part in the controversy over theological problems which was going on at the time. He died at Hindhead on Dec. 4, 1893.

For the substantial publication of his researches reference must be made to the *Transactions of the Royal Society;* but an account of many of them was incorporated in his best-known books, namely, the famous *Heat as a Mode of Motion* (1863; and later editions to 1880), the first popular exposition of the mechanical theory of heat, which in 1862 had not reached the text-books; *The Forms of Water,* etc. (1872); *Lectures on Light* (1873); *Floating Matter in the Air* (1881); *On Sound* (1867; revised 1875, 1883, 1893). The original memoirs themselves on radiant heat and on magnetism were collected and issued as two large volumes under the following titles: *Diamagnetism and Magne-crystallic Action* (1870); *Contributions to Molecular Physics in the Domain of Radiant Heat* (1872).

TYNDARIS, an ancient city on the northern coast of Sicily, 5 m. east of Patti. It was founded (almost the last Greek city

in Sicily) by Dionysius the Elder in 395 B.C. It was one of the earliest allies of Timoleon. In the first Punic War it was dependent on Carthage, but expelled the Carthaginian garrison in 254 B.C. and joined the Romans. It was one of the points occupied by Sextus Pompeius, but was later used by Agrippa as a base. Pliny mentions that half of it (the north and north-east portion) was swallowed up by the sea (*Hist. nat.* ii. 206). The site is fine, an isolated hill (920 ft.) with spurs, rising abruptly seaward, and connected by a narrow isthmus with the lower ground inland. It has a magnificent view, including even the summit of Etna.

Remains of the city walls, built of rectangular blocks of stone, with several towers may be seen, and the main gate, on the land side, is traceable. Within are remains of a building incorrectly called the gymnasium, constructed of ashlar masonry, with three narrow halls, each about 90 ft. long; of a building with mosaic pavements, and a small theatre, the internal diameter of which is 212 ft., and the length of the stage 80 ft.

See R. V. Scaffidi, *Tyndaris* (Palermo, 1895). (T. A.)

TYNE, river in England, flowing into the North sea. The North Tyne rises, 80 m. from the mouth, at the south-west end of the Cheviot Hills, and has a wooded valley. At Bellingham it receives the Rede, whose valley, Redesdale, is the site of the battle of Otterburn (1388). The South Tyne rises below Cross Fell and flows north past Alston as far as Haltwhistle, where it turns east. The valley receives from the south the picturesque Allendale. The two branches join near Warden, above Hexham (30 m. from the sea) and the united stream continues past Corbridge, where a Roman road crossed it. In its last 15 m. the Tyne, here the boundary between Northumberland and Durham, is an important waterway, navigable up to Blaydon. Collieries and large towns line the banks—Newburn, Newcastle-upon-Tyne, Wallsend and North Shields on the north side; Gateshead, Jarrow and South Shields on the Durham side, with many lesser centres, forming continuous lines of factories and shipbuilding yards, necessitating the dredging of the river. At high-water spring tides there is 40 ft. of water at Shields Harbour at the river's mouth, and 29 ft. at Newcastle, 8 m. up the river.

TYNEMOUTH, municipal, county and parliamentary borough, Northumberland, England, including the townships of Chirton, Cullercoats, North Shields, Preston and Tynemouth. Pop. (1921) 63,770. North Shields, Tynemouth and Cullercoats are successive stations on a branch of the L.N.E.R. Tynemouth lies on the north bank of the Tyne, 8½ m. E. of Newcastle. Tynemouth is the principal watering-place and residential district on this part of the coast. On the point of the promontory on which it stands is a small battery called the Spanish battery. Within the grounds, to which the gateway of the old castle gives entrance, are the ruins of the ancient priory of St. Mary and St. Oswin—the principal remains being those of the church, which was a magnificent example of Early English work engrafted upon Norman. The municipal buildings are in North Shields, which is also an important seaport. (*See* NORTH SHIELDS.)

Although Roman remains have been discovered, the early history centres round the priory, founded (617–633) by Edwin, king of Northumbria. In 651, Oswin, king of Deira, was buried here. After the conquest Malcolm, king of Scotland, and Edward his son, were also buried here. Earl Waltheof gave Tynemouth to the monks of Jarrow, and it became a cell to the church of Durham, but later, to the abbey of St. Albans in Hertfordshire. The priory was probably fortified in Saxon times, and was strengthened by Robert de Mowbray. After the Dissolution the fortifications were repaired by Henry VIII. In 1642 it was garrisoned for the king by the earl of Newcastle, but surrendered to parliament in 1644. It became barracks at the end of the 18th century.

Tynemouth and North Shields did not become important until the 19th century; the establishing of a port here and holding of fairs being prevented by the people of Newcastle. Before that time charters were granted in 1203 and 1204 to the prior and convent, and include freedom from toll, etc. In 1292 there were disputes between the citizens of Newcastle and the prior, who had built a quay at North Shields, but was obliged by act of parliament to destroy it. Edward IV. in 1463 confirmed the previous charters of the monks, and at the same time gave them and t tenants licence to buy necessaries from ships in the "port river of Tyne," and to load ships with coal and salt. After Napoleonic wars the trade of North Shields rapidly increa The borough was incorporated in 1849, and has returned member to parliament since 1832.

TYPE, PRINTING: *see* PRINTING TYPE.

TYPE-CASTING MACHINES: *see* PRINTING TY PRINTING.

TYPE METAL. An alloy containing antimony as the ess tial constituent; the other ingredient being lead, often with a tion of tin and less frequently of copper. Metallic type contain antimony was used in the 17th century (Basil Valentine).

Antimony increases the fusibility and hardness of metals w which it is alloyed and imparts to these alloys its characteri property of expansion on solidification. Typical alloys for print type have the following proportions:—

	Lead	Anti-mony	Tin	C p
Type metal	60	30	10	
"	70	18	10	
"	77·5	16	6·5	
"	82	15	3	
Stereotype Metal	85·7	14·3		
" "	82·5	13	4·5	
Linotype Metal	84·5	13·5	2	
" "	82	13	5	
Cheap Linotype Metal	85·5	11	3·5	

The proportions given for linotype metals approximate fa closely to the most fusible (eutectic) alloy of lead (85%), a mony (13%), with an addition of tin (2%). This alloy has comparatively low melting point of 246°C., a degree of fusibil which renders it useful in the production of this form of ty

Type metal, being easily cast, is used for statuettes, meta candlesticks and other decorative objects. A lead-antimony al (lead two parts to one of antimony) is used for the metallic k of certain reed musical instruments.

So-called *hard lead* or *antimonial lead* containing antimo (15%) and lead (85%) is used for chemical stopcocks, *e.g.*, in sulphuric acid industry. (G. T. M.)

TYPE SETTING: *see* PRINTING and TYPOGRAPHY.

TYPEWRITER, a machine which prints characters in quence, performing the work of writing at a speed far grea than is possible with the pen. Formerly the term "typewrit was also applied to the operator, but more recently the opera has become known as a "typist."

Early Machines.—The first recorded attempt to invent a ty writer is found in the records of the British Patent Office. The show that on Jan. 7, 1714, a patent was granted by Queen An to Henry Mill, an English engineer, for "an Artificial Machi or Method for the Impressing or Transcribing of Letters Sing or Progressively one after another, as in Writing, whereby Writing whatever may be Engrossed in Paper or Parchme so Neat and Exact as not to be distinguished from Print." Mil machine was never manufactured. Only one other attempt w recorded in the 18th century. This was a machine invented 1784 for embossing characters for the blind. The first Americ patent on a typewriter was granted in 1829 to William Aust Burt of Detroit. The only model of this machine was destroy by fire at the Washington Patent Office in 1836.

In 1833, a French patent was granted to Xavier Progin (Projean), of Marseilles, for a device which he described as "Ktypographic" machine or pen. It consisted of an assembly bars with type, each type striking downward upon a comm centre. The Progin device was the prototype of all our prese type-bar machines. The next important step was taken by Charl Thurber of Worcester, Mass., to whom an American patent w granted in 1843. In this machine the letter spacing was effect by the longitudinal movement of a cylinder or platen, a princip which is a feature of all present-day standard writing machine A different model, brought out by Thurber in the year 1845, w designed to perform the motions of the hand in writing, a was intended for the blind. In the previous year a machin

EVOLUTION OF THE TYPEWRITER

1. Thurber's Machine, 1843
2. Francis' Machine, 1857
3. Sholes, Glidden and Soule Machine, 1868
4. The first shift-key typewriter, 1878
5. Royal Standard Typewriter, 1914
6. The first practical typewriter, 1874
7. Remington Noiseless Typewriter, 1925
8. Bookkeeping Machine, 1928
9. Portable typewriter, 1924

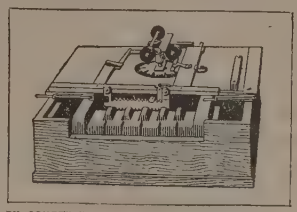
intended for the blind, was shown by Littledale at the York ing of the British Association. Pierre Foucault, a teacher in Paris Institute for the Blind, patented a machine in 1849 was shown at the great exhibition in London in 1851, and is to have embossed characters for the blind admirably.

om 1850 the attempts became more numerous. Among those took out patents in America during this period were Oliver ddy of Baltimore, in 1850, J. B. Fairbanks, 1850, J. M. Jones Clyde, N.Y., 1852, R. S. Thomas of Wilmington, N.C., Alfred Ely Beach of New York, 1856, J. H. Cooper of delphia, 1856, Dr. Samuel W. Francis of New York, 1857, y Harger, 1858, F. A. de May of New York, 1863, Benja- Livermore of Hartland, Vt., 1863, Abner Peeler of Webster Ia., 1866, Thomas Hall, 1867, and John Pratt of Centre, who in 1866, while a resident in London, produced a device d the "Pterotype" (winged type), which operated on the type- l principle. Contemporary efforts by European inventors were of Sir Charles Wheatstone in England, who constructed al experimental models between 1855–60; the Ravissa ma- in Italy belongs to that period, and the models built by Peter erhofer of the Tyrol, in 1864 and 1866. Among the promising of these efforts were those of Beach and Francis. h's machine operated in much the same manner as a modern writer, but it wrote only on a narrow ribbon of paper. This ine, like so many others of this period, was designed for the l, and printed raised letters which could be read by touch. machine invented by Dr. Francis was a bulky affair, with like those of a piano. Type-bars were arranged in a circle, ing at a common centre.

rst Practical Typewriter.—The invention of three resi- of Milwaukee, Wis., Christopher Latham Sholes, Carlos den and Samuel W. Soulé, in 1867, resulted in the first prac- machine. Soulé soon retired from the undertaking, but es, within five years, made nearly 30 experimental models. first of these, showing the working principles only, was red in patent of June 23, 1868. The second one, patent of 14, 1868, was the first efficient typewriter model, in that it d write well, at a speed far exceeding the pen. It was still, ver, a very crude machine, lacking the now familiar type- r carriage, with its paper cylinder, and the keyboard in its nt form. Many improvements followed and finally, on Mar. 73, a contract was made with E. Remington and Sons, gun- rs, of Ilion, N.Y., for the development and manufacture of Sholes and Glidden machine. The first completed typewriters placed on the market early in 1874 and the machine was soon med the Remington. Among its original features which re- standard in 1928 machines are the paper cylinder, with its spacing and carriage-return mechanism, the escapement which s the letter spacing, the arrangement of the type-bars so as rike the paper at a common centre, the actuation of the bars by means of key levers and connecting wires, printing gh an inked ribbon, and the positions of the different charac- on the keyboard, which conform almost exactly to the gement now known as "universal."

e first typewriter had no shift-key mechanism—it wrote al letters only. The problem of printing both capitals and letters without increasing the number of keys was solved acing two types, a capital and small face of the same letter, ch bar, in combination with a cylinder-shifting mechanism. first shift-key typewriter appeared on the market in 1878. there appeared another solution of the same problem in the lled single key- or double keyboard machines, which contained the number of keys—one for every character, whether capi- small letter. For many years the single-key and the shift- machines competed for popular favour, but the advent of the h method" of typing, for which the compact keyboard of the key machines was far better suited, decided this issue. Touch g was slow in its early progress and before the '90s was ised only by operators of exceptional skill. In the latter le, however, it rapidly gained acceptance and since 1900 it been practically the universal method of instruction.

other early issue in the field of the typewriter concerned the relative merits of the type-bar and the type-wheel principles. The latter construction traces its descent through the Burt machine of 1829 and the Pratt machine of 1866. In modern machines of this variety the types are mounted on a circle or segment, the operation of the keys brings each type to correct printing position, and the imprint of type on paper is produced by a trigger action. The type-wheel machines offer an advantage in the ease with which the type segments may be changed, thus extending the range and versatility of the machine. However, machines of this construction have never been very serious competitors of the type-bar machines in the general commercial field. On nearly all typewriters the printing is done through an inked ribbon, which is fitted on spools, travels with the operation of the machine, and reverses automatically when one spool becomes completely unwound, the latter improvement dating from the year 1896.



BY COURTESY OF THE REMINGTON TYPEWRITER CO.

SHOLES' FIRST MODEL OF THE TYPEWRITER

Following the first shift-key typewriter of 1878, the next great advance was the advent of visible writing. On all of the early type-bar machines the bars were arranged in a circular "basket," located underneath the carriage, and the type printed at a common point on the under side of the cylinder. This construction compelled the operator to raise the carriage in order to see the writing line. The first visible writing machine appeared in 1883. The earlier visible machines employed the down-stroke principle, the type striking on top of the cylinder. Later the front-stroke machines took the lead in the general business field, the first machine of this type to attain prominence dating from 1897. In front-stroke machines the type-bars are placed in a segment in front of the carriage, the type printing on the front of the cylinder. This solved the problem of visible writing and all writing machines of the leading standard makes are of this type.

Recent Developments.—Since the advent of visible writing there have been two other major developments in the general typewriter field, the development of the portable and the noiseless machine. The former—small, light, compact and easily carried—is especially designed for the owner's personal use. The earliest of these was a small machine of the type-wheel variety. The first type-bar portable to attain a considerable market appeared in 1912. Type-bar portable machines of all the leading makes are on the market, and their sale is extending the use of the typewriter to every kind of personal writing. The noiseless machine is a front-stroke machine of the type-bar variety, equipped with the usual standard keyboard. It differs, however, from other type-bar machines in that the printing is done not by percussion but by pressure, thus reverting to the principle of the printing press. This is accomplished by means of a little weight on the back of the type-bar. As the type-bar starts, this weight gathers momentum and presses the type against the paper, swiftly and noiselessly. It is too early as yet to predict the future of the noiseless typewriter, but it is obviously growing in popularity.

Form and Tabular Work.—The extension of the uses of the typewriter to form and tabular work of every kind constitutes a distinct and separate development. During the first 25 years of its history, the time-saving service of the typewriter was confined almost entirely to straight, line-by-line writing, such as letter and manuscript writing, and the like. This limitation was due to the lack of any mechanism for the instantaneous setting of the carriage at any desired writing point. This need, however, was supplied by the decimal tabulator, which appeared in 1898. This device permitted the writing of columns of figures, anywhere on the page and as many as the page would hold, with the same speed as ordinary work. From this improvement the advance to the machine which would add the columns as written was a natural transition. The first *adding typewriters* added in vertical columns only, but from these in turn have been evolved the complete book-keeping or accounting machines, which write and add (or subtract)

simultaneously, both vertically and across the page, in any combination that the work requires. In this field the standard typebar machines, with tabulating and computing mechanisms, have a competitor in the so-called flat-platen machine, which is similar in its combined writing and adding performance, but prints on a flat bed instead of a travelling and revolving cylinder. (*See* TABULATING MACHINES.)

The service rendered by the accounting or book-keeping machine is broadly that of the ordinary typewriter, intensified. The combination in one operation of two tasks, writing and adding, eliminates the separate adding cost. A further advantage is the error proofing of every task, the machine furnishing its own accounting controls. The application of electricity to the operation of the machine has made its greatest advance in the accounting machine field. At least one operation, the return of the carriage, is usually performed by electric drive. In the general typewriting field, more than one manufacturer has already brought out a machine which is electrically operated.

The typewriter has been one of the great transforming factors of modern business. One problem which confronted the writing machine in its early days was the securing of competent operators. Out of this need arose the modern commercial school, now a prominent feature in the educational system of every country. Socially the changes wrought by the typewriter have been even more noteworthy. Everywhere except in oriental countries the majority of stenographers and typists are women, and it is historically established that in all western countries, beginning with America, it was the typewriter that first opened to women the doors of business life. (A. C. RE.)

TYPHOID FEVER. Typhoid is a specific infectious fever caused by B. typhosus (*see* BACTERIA AND DISEASE) and characterized mainly by its insidious onset, peculiar course of the temperature, specific lesion of the bowels and eruption upon the skin. The disease has received various names, such as enteric fever (*q.v.*), gastric fever, abdominal typhus, infantile remittent fever, slow fever, nervous fever, "pythogenic fever," etc. Here, typhoid fever according to its modern interpretation is considered, but much that is said on dissemination, prevalence, etc., is also true for the paratyphoid fevers.

Though typhoid fever is a general infection producing respiratory (bronchitis), cutaneous ("rose spots") and occasionally periosteal lesions the most noticeable effects occur in the lower part of the small intestine (ileum), particularly about the ileo-caecal valve and concern the "solitary glands" and "Peyer's patches." These glands, comparatively indistinct in health, become inflamed, large and prominent during the first 8–10 days of the fever. During the second week these enlarged glands necrose and are cast off in mass or in fragments into the lumen of the gut, leaving ulcers in its walls. These ulcers may be few or many in number, and are usually oblong, with their long axis in that of the bowel, and have thin and ragged edges. They may extend through the thickness of the intestine to the peritoneal coat and in their progress erode blood-vessels or perforate the bowel. This stage of ulceration exists from the second week onwards during the remaining period of the fever, and even into the stage of convalescence. In favourable cases the ulcers heal by cicatrization without contraction of the calibre of the bowel. The intestinal lesions do not appear synchronously so that all the above stages may be found at the autopsy of a fatal case. The mesenteric glands and the spleen become enlarged during the progress of the fever, but usually subside after recovery.

Symptoms.—The onset of typhoid fever is very much less marked than that of most other fevers. Early symptoms are headache, lassitude and discomfort, together with sleeplessness and feverishness, particularly at night. The peculiar course of the temperature is also one of the most important diagnostic evidences of this fever. During the first week it rises by steps. Thus the morning temperatures on the first four days might be 99°, 100°, 101°, 102° F, the corresponding evening temperatures being 101°, 102°, 103°, 104° F. About the eighth day, in an average case the highest point is attained. During the second and third weeks temperature remains high with but slight morning remission. In a favourable case during the fourth week gradual return to norm begins to take place. Although the patient may, during the earl days of the fever, be able to move about, he feels languid a uneasy; and usually before the first week is over he has to ta to bed. He is restless, hot and uncomfortable, particularly as t day advances, and his cheeks show a red flush, especially in t evening or after taking food. From an early period in the dise the abdomen is somewhat distended and pain accompanies lig pressure about the lower part of the right side close to the groin the region corresponding to that portion of the intestine in wh the morbid changes already referred to are progressing. Diarrh is a frequent but by no means constant symptom. When pres it may be slight or extremely profuse, and it corresponds, as rule, to the severity of the intestinal ulceration. The dischar are light yellow and resemble pea soup. Should intestinal haem rrhage occur, they may be dark brown, tarry or composed entir of blood. About the beginning, or during the course of the s ond week of the fever, an eruption frequently makes its appe ance on the skin. It consists of isolated oval or round spots, a pale pink or rose colour, and of about one to one and a h lines in diameter. As a rule they are few in number and are se chiefly upon the abdomen, chest and back, and come out in cro which continue for four or five days and then fade away. Wh present crops continue to come out till nearly the end of the fev and they may reappear should a relapse subsequently occur. T symptoms persist throughout the third week, usually, howev increasing in intensity. By the end of the third week the pati is prostrate and emaciated; the tongue is dry and brown, the pu quickened and feeble, and the abdominal symptoms marked; wh nervous disturbance is exhibited in delirium in tremors and je ings of the muscles. Convalescence proceeds slowly and is apt be interrupted by relapses.

Death in typhoid fever usually takes place from one of t following causes. (1) Exhaustion, in the second or third wee or later. Sometimes sinking is sudden, from heart failure. (Haemorrhage from the intestines. The evidence of this is hibited not only in the evacuations, but in the sudden fall temperature and rise in pulse-rate, together with great pall faintness and rapid sinking. Sometimes haemorrhage, to a dang ous and even fatal extent, takes place from the nose. (3) Perfo tion of an intestinal ulcer. This gives rise, as a rule, to sudden a intense abdominal pain, together with vomiting and signs collapse, viz., a rapid flickering pulse, cold clammy skin, and t marked fall of temperature. Symptoms of peritonitis quic supervene and death usually takes place within 24 hours. (Occasionally, but rarely, hyperpyrexia (excessive fever). (Complications, such as pulmonary or cerebral inflammation.

Certain sequelae are sometimes observed, the most import being phlebitis (*q.v.*), periostitis affecting long bones, general health and anaemia, with digestive difficulties, often lasting fo long time, and sometimes issuing in pulmonary tuberculo Occasionally, after severe cases, mental weakness is noticed, b it is usually of comparatively short duration. The prognosis typhoid varies widely and is greatly influenced by the quality the nursing. Nevertheless it is distinctly worse in tropical th in temperate climates and is one of the most feared diseases amc Europeans in India.

The susceptibility of individuals to the typhoid bacillus var greatly. Some persons appear to be quite immune. The m susceptible age is adolescence and early adult life; the great incidence, both among males and females, is between the a of 15 and 35. The aged rarely contract it. Men suffer c siderably more than women, and they carry the period of mark susceptibility to a later age.

Dissemination.—The sick, from whose persons the germs the disease are discharged, are always an immediate source danger to those about them. There is evidence that this is t case with armies in the field, *e.g.*, the conclusions of the comm sion appointed to inquire into the origin and spread of ente fever in the military encampments of the United States in t Cuban campaign of 1898. Out of 1,608 cases most thorough investigated, more than half were found to be due to direct a

ect infection in and from the tents (Childs: Sanitary Con-, Manchester, 1902). A similar but perhaps less direct mode fection was shown to account for a large number of cases r more ordinary conditions of life in the remarkable outbreak Maidstone in 1897 (*see* below), which was also subjected to thorough investigation. It was undoubtedly caused in the instance by contaminated water, but 280 of the later cases attributed to secondary infection, either direct or indirect, the sick. A good deal of evidence to the same effect by cal officers of health in England has been collected by Dr. Hall, who has also pointed out that the attendants on typhoid nts in hospital are much more frequently attacked than is monly supposed (*Trans. Epidem. Soc.* vol. xix.).

scoveries as to the part played in the dissemination of typhoid by "typhoid carriers" (*see* CARRIERS) have thrown light upon subject of personal infection. The subject was first investi-d by German hygienists in 1907, and it was found that a derable number of persons who have recovered from typhoid continue to excrete typhoid bacilli in their faeces and urine hoid bacilluria). The liability of a patient to continue this tion bears a direct relation to the severity of his illness, and probable that the bacilli multiply in the gall bladder, from h they are discharged into the intestine with the bile. The ition in a small number of persons may persist indefinitely. 01 cases investigated, Kayser found three still excreting bacilli years after the illness, and George Deane has recorded a case hich bacilli continued to be excreted 29 years afterwards.

any outbreaks have in recent times been traced to typhoid ers, one of the first being the Strassburg outbreak. The owner bakehouse had had typhoid fever ten years previously, and as noticed that every fresh employé entering her service de-ped the disease. She prepared the meals of the men. On her sion from the kitchen the cases ceased. In Brentry reform-y, near Bristol, an outbreak numbering 28 cases was traced woman employed as cook and dairymaid who had had typhoid r six years previously. Before entering the reformatory she been cook to an institution for boarded-out girls, and during year's residence there 25 cases had occurred. Numerous cases ntamination of milk supplies by a "carrier" have been investi-d, and in outbreaks traced to dairies it is wise to submit the d of all employés to the agglutination test.

he other means of dissemination are polluted soil, food and k, particularly milk and water. The mode in which polluted acts is by contamination of water-supply. Exhalation is not rded as a channel of communication. The researches of ors Firth and Horrocks prove that dust, flies and clothing convey the germs. Another way in which food becomes the ium of conveyance is by the contamination of oysters and r shellfish with sewage containing typhoid bacilli. This has abundantly proved by investigations in Great Britain, Amer-nd France. Uncooked vegetables, such as lettuce and celery, convey the disease in a similar way. The most familiar and rtant medium, however, is water. It may operate directly rinking water or indirectly by contaminating vessels used for ing other liquids, such as milk cans. Outbreaks have been ed to ginger-beer and ice-creams. Water sources become con-nated directly by the inflow of drains or the deposit of ex-l matter; indirectly, and more frequently, by the leakage of ge into wells or by heavy rains which wash sewage matter and t-soil from ditches and the surface of the land into springs watercourses. Water may further be contaminated in the s by leakage, in domestic cisterns and in pipes by suction.

evalence.—Typhoid fever is more or less endemic and liable pidemic outbreaks all over the world. It has undergone ked and progressive diminution in many countries coincidently improved sanitation, particularly in regard to drainage and r-supply. The case of Munich is so instructive that it de-es special mention. For many years typhoid was excessively alent in that city. The prevalence was continuous, but aggra-d by large epidemic waves, extending over several years. se gradually decreased in magnitude, and ceased towards the of 1880. Subsequently the prevalence still further diminished, the average annual mortality per million falling from 2,024 in 1851–1860, 1,478 in 1861–1870 and 1,167 in 1871–1880 to 160 in 1881–1890 and 52 in 1891-1900.

An examination of the relative incidence of typhoid in the counties of England and Wales (Bulstrode) goes to show that its prevalence, broadly regarded, is not capricious. The areas of maximum and minimum incidence remained practically the same throughout the twenty years 1871–1890, though there was everywhere a large diminution. This fact suggests that standing conditions may be as important as those accidental occurrences which attract public attention by causing sudden and explosive outbreaks. When these are on a small scale they may be due to milk; on a large scale they are always water-borne and caused by sudden contamination of a public supply. The classical example is Maidstone. That outbreak began towards the end of August 1897, and within six weeks some 1,500 persons were attacked. The total number of cases was 1,847, with 132 deaths, in a population of about 34,000. With the exception of 280 cases of secondary infection, which lingered on till the following January, they all occurred before the 18th of October, and the disease subsided almost as rapidly as it arose. A mass of evidence of different kinds left no possibility of doubt that accidental contamination of a water-supply was the cause. Perhaps the most striking point is that Maidstone was supplied with water from three different sources, known as Cossington, Boarley and Farleigh, and out of 1,681 cases the respective incidence in these areas was—Cossington 29, Boarley 69, Farleigh 1,583. Another great example of water-borne typhoid was furnished by Philadelphia where 14,082 cases occurred in 1898–1899.

Treatment.—Improved knowledge of the nature and causation of typhoid fever has not led to the successful introduction of a specific treatment; nor have means been found to cut short the illness, though its fatality has been reduced. It still goes through the classical stages, which broadly coincide with first, second and third weeks. Attempts have been made to deal directly with the toxins produced by the bacilli, on the hypothesis that they are formed in the intestinal canal, by the use of internal disinfectants, such as mercury, iodine, carbolic acid, salol, etc., and these agents are sometimes beneficial; but the treatment remains essentially symptomatic, and follows the principles that were recognized before the discovery of the *bacillus typhosus*. One of the most important improvements is the regular use of sponging or bathing for the reduction of temperature. It has even been developed into a continuous bath, in which the patient is kept in water throughout the illness. Since the development of serum-therapy various anti-typhoid sera have been tried in the treatment of the disease but on the whole with indifferent success.

Prevention.—If house drainage were always perfectly carried out, sewage satisfactorily disposed of, water-supply efficiently protected or treated, patients segregated, and the typhoid material excreted by them and typhoid "carriers" effectually annihilated—if, in short, scientific cleanliness were completely attained, the disease would disappear, or be at least excessively rare. In some communities much has been done in the directions indicated; but in many others the lessons of experience are ignored, and even the best practice lags behind theory. The most important difficulty is undoubtedly water-supply. The substitution of public water-supplies for shallow wells and small streams liable to pollution is one of the greatest factors in the diminution of typhoid and other water-borne diseases; but it may give rise to danger on a far larger scale, for a whole community may be poisoned at one blow when such a supply becomes contaminated. Unfortunately, it is extremely difficult to prevent contamination with certainty in a populous country. Theoretically, water may be pure at its source, and may be distributed in that condition. Such is water derived from deep wells and springs, or gathered from uncultivated and uninhabited uplands. In the one case it has undergone natural filtration in the ground; in the other, it escapes all risk of pollution. These waters are generally pure, but the condition cannot be relied on. A tramp or a shepherd may pollute the most remote gathering-ground unless it be fenced in; deep wells may be similarly fouled by workmen, and sewage may find its way into them

from the surface or through fissures. To secure purity, therefore, and prevent liability to outbreaks of typhoid and other intestinal diseases, all gathering-grounds should be fenced in, and water, even from deep wells, should be regularly examined, both chemically and bacterioscopically, in order that any change in composition may be detected. In the water-supplies of great populations such examination should be made daily. Further, all supplies which are not above suspicion should be filtered through sand or sterilized by boiling. The latter can be carried out by simple means in the case of individual domestic water, and attempts have been made to apply it by means of mechanical apparatus to supplies on a larger scale. It is not, however, applicable to the water-supply of large towns. Sand filtration is at present the best mode of dealing with these supplies. There is no purer water than that which has been properly treated by subsidence and sand filtration, even when it is taken from an impure source. So far as the prevention of typhoid and other water-borne disease is concerned, it is certainly safer than the unfiltered water which is taken from so-called pure sources. It cannot be a mere coincidence that London, Hamburg, Berlin and other towns using well-filtered but originally impure river water should be generally freer from water-borne disease than many large towns drawing their supply from purer sources but neglecting to filter it. The table below, prepared by Mr. Caink, while engineer to the city of Worcester, illustrates this fact, which has also been noted by Professor Saltet of Amsterdam as holding good of the Netherlands.

Various Factors.—The amount of typhoid is dependent on other factors besides the water-supply, but the close connection between the two and the influence of filtration are well attested by the experience of Worcester, where the great reduction recorded after 1894 coincided with new and improved filtration. The weak point about sand filtration is that it is apt to be imperfectly performed when the filters are frozen or newly cleaned, or when the process is too rapid. Filtration through porcelain is an efficient purifier, but it is not applicable to supplies on a large scale, and almost invariably breaks down through clogging of the filters. Other portable filters are useless or worse. The best emergency treatment for suspected drinking water is boiling, and the next best is chlorination.

Occurrences of Typhoid in England According to Sources of Water-supply

Source of water	Town	Annual typhoid case-rate per 100,000								
		1892	1893	1894	1895	1896	1897	1898	1899	1900
Deep wells in Red Sandstone	Wolverhampton	109	184	109	146	159	117	124	224	237
	Birkenhead	157	207	185	165	138	126	211	230	145
Deep wells in Chalk	Southampton	145	159	109	83	78	64	153	171	109
Upland surface water	Liverpool	152	275	267	190	168	160	129	149	115
	Manchester	120	120	90	96	92	90	118	78	78
	Plymouth	126	63	47	32	31	49	41	49	120
Rivers (filtered)	London	65	84	77	81	71	70	66	98	95
	Reading	30	35	28	53	30	67	32	48	41
	Worcester	155	145	110	36	43	45	31	50	26
Average of 219 towns		88	142	103	115	102	100	115	127	116

Next to water-supply, and hardly less important, is drainage. The drying and cleansing of the soil by good household drainage and sewerage is essential to the prevention of typhoid. Cess-pits, leaking drains and privies, especially when there is only one to several houses, as in many industrial towns, are powerful allies of this disease. The drainage of all old houses is defective and dangerous. The ground about them is commonly honeycombed with cess-pits and saturated with sewage. The only way to discover and remedy such defects is to lay them bare with the pickaxe and shovel. Soil-pipes should always be trapped and ventilated. In short, no disease requires for its prevention more careful attention to house sanitation. The paving of yards and other spaces is also desirable in towns, on account of the liability of the unprotected soil to harbour moisture and filth.

Other modes by which the disease is spread—such as shellfish, milk and uncooked vegetables—suggest their own remedy. The dissemination by dust and flies is less easily prevented. All that can be done is to segregate the sick and promptly destroy all dangerous matters proceeding from them. It should be rem bered that the urine may be an even greater source of danger the faeces. The same observation applies to the prevention o fection from person to person. There is no doubt that sufficient is often wanting, even in some hospitals, in handling pati soiled linen and clothes, and in dealing promptly and effectu with their excreta. For the effectual segregation and treatmen persons suffering from typhoid prompt recognition is necess and this, unfortunately, is a matter of much difficulty on acc of variation in the type and severity of the illness. Bacteriolog science has here come to the assistance of the clinical physi with blood cultures and the Widal reaction, which are of g diagnostic value when carefully performed. But obviously t remedies can only be applied to persons in the position of patie it is of no use in the case of those who do not proclaim themse ill, but go about their business when suffering from the dise Such "ambulatory" cases have long been recognized as an imp tant factor in spreading the disease.

Typhoid Among Armies.—Before the introduction of a typhoid vaccination the prevention of typhoid among armie the field was a problem of special difficulty, not in principle because of the conditions. During the South African War 1899–1902, 31,000 men were invalided home to England on count of typhoid fever. Extraordinary results were obtained the Japanese army medical department in the Russo-Japanese W of 1904–05 in the prevention of typhoid fever, which up to t period was responsible for the largest mortality of any dise affecting armies in the field. Handbooks on the avoidance cholera, plague and typhoid fever were issued to the troops. Boil water in quantities was provided for the soldiers, each battali having its boiling outfit. Even foreign attachés and correspon ents were requested to observe the regulations on this point. Wi this there was a systematic advance testing of wells, the wells b ing labelled "fit for drinking" or "for washing purposes only." being impossible to suppress the presence of flies on food, ca was taken to cover all latrines and cover and disinfect excreta, that infection from flies was reduced to a minimum. Food w transferred from sterilized caldrons into sterilized lacquer box and served on sterilized plates. A crematory was attached to ba hospitals, where all nightsoil, garbage and waste was burnt dail Owing to these precautions the incidence of infectious diseas notably typhoid fever, was reduced to a figure unparalleled in ar previous war, only 3·51% of the total sickness being due to i fectious disease. Taking the number of men at the front in Apr 1905 to have been 599,617, the entire deaths from infectious ar contagious diseases amounted to 1·24% of the entire army in th field. In the World War care in disposal of sewage, chlorination water and anti-typhoid vaccination of the troops reduced th typhoid incidence and case mortality to a still lower point notabl in the British armies in France (*see* THERAPEUTICS).

Anti-typhoid Inoculation.—This consists in a hypoderm injection of the dead organism of the disease into the person wh is to be protected. Protection is acquired in about 10 days an lasts 18 months to 2 years. The method was initiated by S Almroth Wright in 1896, who first used broth cultures sterilize at 60° C. The method now in use is to grow the organisms o a solid medium and to suspend them in a saline. Sterilization i

ed out at a temperature of 53° C and 0·4% Lysol is added rwards. The vaccine is standardised to contain 1,000 million oid organisms and 750 million of each of the two paratyphoid lli per cubic centimetre. Table I. shows the details in con- ion with the disease in various wars during modern times, of these the European war was the only one in which anti- oid inoculation was extensively used.

TABLE I.

War		Mean strength of force	Total number of enteric cases	Annual incidence per 1000
anco-German War (Germans)		1,140,000	72,393	63·0
anish American War (Americans)		211,000	20,738	98·0
l Boer War (British)		208,226	57,684	105·0
orld War				
British Troops		2,000,000	20,149	2·5

	Salonika	152,000	1,709	3·8
	Egypt	187,333	3,856	6·9

he opponents of antityphoid inoculation attribute the enor- s reduction of enteric fever in the last war to improved sani- measures. These have undoubtedly played their part, but prophylactic inoculation must have had a large share in this ction is supported by the lower incidence of the disease ngst inoculated as compared with uninoculated persons when were living under the same conditions. Table II. contains a comparisons between these two sets of persons in different s of the world.

TABLE II.

	Incidence per 1000 men	
	Inoculated	Uninoculated
tish Army in India, 1911	1·7	5·9

ere is besides abundant proof that though an inoculated man contract the disease it is less likely to prove fatal than in case of an uninoculated man. Good reports have been re- d from the Continent of oral administration of the typhoid ne, but this method must be considered to have only reached xperimental stage at present. (N. T. W.)

YPHON, in Greek mythology, youngest son of Gē and arus; or of Hera without father (*Homeric Hymns*, iii. 349 *et* . He is described as a grisly monster, with 100 dragons' s, who was conquered and cast into Tartarus by Zeus. In accounts, he was confined in the land of the Arimi in ia (*Iliad*, ii. 783) or under Etna (Aeschylus, *P.V.* 370), or in volcanic regions, where he was the cause of eruptions. He probably a personification of volcanic forces. Amongst his ring by Echidna were Cerberus, the Lernaean hydra, and the Chimaera. He was also the father of dangerous winds, and by later writers is identified with the Egyptian Set.

TYPHOON. The name is applied to the extremely violent circular storms, 50 to 100m. in diameter, which occur in autumn and travel slowly in the western Pacific between the Philippine Islands and Japan. (The term is of uncertain origin but probably connected with the Chinese *t'ai fung*, great wind, or the Arabic and Hindustani *tufān*, a tempest.) A similar storm in the West Indies is termed a hurricane. William Dampier entered in his log book under July 4, 1687, the earliest known European description of a typhoon (tuffoon).

TYPHUS FEVER, an acute infectious disease, highly contagious, lasting for about fourteen days, and characterized mainly by great prostration of strength, severe nervous symptoms, and a peculiar eruption on the skin. It has received numerous other names, such as pestilential, putrid, jail, hospital fever, exanthematic typhus, etc. It appears to have been known for many centuries in epidemic form, in all countries in Europe. The best accounts of the disease are those given by old English writers, who narrate its ravages in towns and describe many "black assizes," in which it was communicated by prisoners brought into court to the judges, jurymen, court officials, etc., with fatal effect. Typhus fever has been observed in almost all parts of the world; but it is most frequent in temperate or cold climates.

Of predisposing causes the most powerful are overcrowding and poverty. Armies in the field are also liable to suffer from this disease; for instance, during the Crimean War it caused an enormous mortality among the French troops. It is now known to be conveyed by lice (*see* ENTOMOLOGY, MEDICAL).

Typhus is now regarded as certainly due to the action of a filter passing virus (*q.v.*) but the relation of this to certain minute bodies found in the spleen and known as Rickettsia bodies from their discoverer is not yet certain.

Course of the Disease.—The course of typhus fever is characterized by certain well-marked stages. 1. The stage of *incubation* is believed to vary from a week to ten days. During this time, beyond languor, no particular symptoms are exhibited.

2. The *invasion* begins in general, with a rigor, headache and sleeplessness. The temperature rises to 103°–105° F, at which it continues with little daily variation until about the period of the crisis. The pulse is rapid (100–120 or more) and at first full, but later feeble. The tongue, at first coated with a white fur, soon becomes brown and dry, while sordes (dried mucus, etc.) accumulate upon the teeth; the appetite is gone; and intense thirst prevails. The bowels are as a rule constipated, and the urine is diminished in amount and highly coloured.

3. The third stage is characterized by the appearance of the *eruption*, which generally shows itself about the fourth or fifth day or later, and consists of dark red (mulberry-coloured) spots or blotches varying in size from mere points to three or four lines in diameter, very slightly elevated above the skin, at first disappearing on pressure, but tending to become both darker and more permanent. They appear chiefly on the abdomen, sides, back and limbs, and occasionally on the face. Besides this characteristic typhus rash, there is usually a general faint mottling all over the surface. The rash is rarely absent. In the more severe and fatal forms of the fever slight subcutaneous haemorrhages (petechiae) are to be seen in abundance. After the appearance of the eruption the patient's condition seems to be easier, so far as regards the headache and discomfort which marked the outset of the symptoms; but this is also to be ascribed to the tendency to pass into the typhous stupor which supervenes about this time, and becomes more marked throughout the course of the second week. Marked leucocytosis is present and is considered to be diagnostic in doubtful cases when the rash is badly marked. The patient now lies on his back, with a dull dusky countenance, an apathetic or stupid expression, and contracted pupils. Delirium, usually of a low muttering kind, but sometimes wild and maniacal (*delirium ferox*),

is present both by night and day. The peculiar condition to which the term "coma vigil" is applied, in which the patient, though quite unconscious, lies with eyes widely open, is regarded, especially if persisting for any time, as an unfavourable omen. Through the second week the symptoms continue unabated.

4. A *crisis* or favourable change occurs about the 14th day, and is marked by a more or less abrupt fall of the temperature and of the pulse, slight perspiration, discharge of loaded urine, return of moisture to the tongue, and a change in the patient's look, which shows signs of returning intelligence. Although the sense of weakness is extreme, convalescence is in general steady and comparatively rapid.

Typhus fever may prove fatal during any stage of its progress, either from sudden failure of the heart from the supervention of some nervous symptoms, such as meningitis or of deepening coma, or from some complication, such as bronchitis.

The mortality from typhus fever is estimated by Charles Murchison (1830–1879) and others as averaging about 18% of the cases, but it varies much according to the severity of type (particularly in epidemics), the previous health and habits of the individual, and very specially the age—in children under fifteen the death rate is only 5%, in persons over fifty, about 46%.

Treatment.—The treatment of a patient with typhus fever is general and symptomatic. So far as preventive treatment is concerned, chief importance attaches to methods for delousing the population. Naturally all methods tending towards personal cleanliness, good housing, sufficiency of food militate against the occurrence of epidemics.

The main element in the treatment of this fever is good nursing, and especially the regular administration of nutriment, of which the best form is milk, although light plain soup may also be given. The food should be administered at stated intervals, not, as a rule, oftener than once in one and a half or two hours, and it will frequently be necessary to rouse the patient from his stupor for this purpose. Sometimes it is impossible to administer food by the mouth, in which case recourse must be had to nutrient enemata. Alcoholic stimulants are not often required, except in the case of elderly and weakly persons who have become greatly exhausted by the attack and are threatening to collapse. When the pulse shows unsteadiness and undue rapidity, and the first sound of the heart is but indistinctly heard by the stethoscope, the prompt administration of stimulants (of which the best form is pure spirit) will often succeed in averting danger. Should their use appear to increase the restlessness or delirium they should be discontinued and the diffusible (ammoniacal or ethereal) forms tried instead.

Many symptoms demand special treatment. Opiate and sedative medicines in any form, although recommended by many high authorities, must be given with great caution, as their use is often attended with danger in this fever, where coma is apt to supervene. When resorted to, probably the safest form is a combination of the bromide of potassium or ammonium with a guarded amount of chloral. Alarming effects sometimes follow the administration of opium. The height of the temperature may be a serious symptom, and antipyretic remedies appear to have but a slight influence over it as compared to that which they possess in typhoid fever, acute rheumatism, etc. Hugo Wilhelm von Ziemssen (1829–1902) strongly recommended baths in hyperpyrexia, the temperature of the bath being gradually reduced by the addition of ice. Cold sponging of the hands and feet and exposed parts, or cold to the head, may often considerably lower the temperature. Throughout the progress of a case the condition of the bladder requires special attention, owing to the patient's drowsiness, and the regular use of the catheter becomes, as a rule, necessary with the advance of the symptoms.

TYPOGRAPHER is a derivation of the word typogra and means "a printer." The term has recently been revived is used by those engaged in designing books of an exclusive ch acter, such as those printed at private presses, where a speci designed type may be employed for some specific work. It is a sometimes adopted by "layout hands" employed in advertis departments where booklets and other advertisement matte prepared and sent to the printer to produce.

TYPOGRAPHY is the art of printing. (*See* also the arti PRINTING, PRINTING TYPE and CALLIGRAPHY.) It has as its object not ornament, but utility. The printer must never distra even with beauty, the reader from his text. In the printing books there is less room for individuality of style than in typography of propaganda. The laws of typography in books tended for general circulation are based upon (a) the essen nature of alphabetical writing; (b) the force of tradition. strict as the conventions are, there is not, and can never be rigid character of typography applicable to all books produced a given geographic or ethnic area; or a universal formula acce able to all books printed in Roman types. The strength of tra tion expresses itself in the details of book arrangement and th vary widely. Certain laws of linear composition are, howev obeyed by all printers who use the Roman letter.

A fount of Roman type consists of (1) Roman: CAPITA SMALL CAPITALS, lower case, : . " ; 1 2 3 4 5 etc (); and *Italic: CAPITALS, lower case.* In addition to these, as necess adjuncts, the printer possesses (3) spaces; (4) leads, (5) strai lines of metal known as *rules*, and (6) a collection of mo ornaments, head- and tail-pieces, flowers, decorated initial lett vignettes and flourishes, wood blocks of borders, etc. Anot decorative medium at his command lies in his use of (7) col (red being the most widely used). For emphasis he posses (8) special types of notably heavy face, and may use colour the same purpose. (9) Space is another valuable element, m gins, blanks, etc. being filled in with what are known as "quo tions." Finally (10) there is the nature (colour, weight and t ture) of the paper.

Composition is the selection and arrangement of all these e ments; *Imposition* is the due placing of the composition upon sheet; *Printing* comprises the press-work, securing a perfect of register (backing up), the quality and crispness of inki Typography, therefore, controls composition, imposition paper. The paper (*q.v.*) must be of a character capable of pressing the value of the composition. The margins must be p portionate to the area of the text, allowing convenient space thumbs and fingers at the side and bottom of the page. The diaeval margins as adopted by the Kelmscott Press, are handso and agreeable in certain books, but, are neither agreeable convenient in other books, *e.g.*, where the page dimension is nec sarily small or narrow, and the book is to be carried in the poc For this and other books, the type may well be centered on measure of the page, and slightly raised above ocular centre.

Composition.—The fundamental principles of page-compo tion are deducible from the ocular facts of alphabetical print in the Roman letter. The eye cannot, with ease, read pages words composed of letters designed with sharply contrast thicks and thins. Nor can the eye agreeably read a mass of wo composed even in a rightly constructed letter, unless the line kept to a certain maximum length; that is to say, the read eye cannot comfortably seize more than a certain number of wo in any given size except in a proportionate length of line. can a reader comfortably seize a letter, a word or a line, unl the printer's setting is related to the reader's normal habit vision when holding a book for reading. The typographer's spect for these principles will generally protect the reader fr the risk of "doubling" (that is, reading the same line twice), from being given a book in a large and "staring" type.

The average number of words which the reader's eye can c veniently seize is between 10 and 12 (some 48 characters). typographer, while exerting himself to the utmost to respect t ocular limitation, may often be confronted with certain conditi

make it impossible for him to secure a type of the right d size. He is often forced to the use of a small type, and er to obviate the risk of "doubling," he inserts leads between nes of type and thus increases the space between them.

e practice of leading, denounced in certain quarters, is an ial necessity. The typographer, therefore, in making the se of his material, must make legitimate use of leads. It be added, too, that in certain compositions, leads produce a effect; and in not a few cases, their absence may ruin a sition set even in a relatively large type.

e typographer should know how to extract the utmost from e of a type which is narrow in relation to its height—leading pacing play a decisive part here. A round, open, wide letter for certain purposes, be set "loose"; *i.e.*, the space between tters will be greater (or appear greater by reason of the s of the c, o, e, g, in the lower case), than in a relatively nsed letter. Consistency will here insert a satisfactory lead en the lines.

e space between words composed in a condensed letter is less that between words in a round, wide form. A lead should 's precede and follow quoted matter. Where there is no lead- etween the lines, and the composition is necessarily tight, it be an advantage to set leads between the paragraphs.

lention is a most important detail. The opening sentence of work should automatically manifest itself as such. This be contrived by using a large initial letter, by printing the word in CAPITALS, or SMALL CAPITALS, or CAPITALS and L CAPITALS. The first word may be set into the margin; t should *not* be indented. Indention marks paragraphs—the quent sections of the text. Where for any reason it may ecessary to avoid indention in paragraphs, a lead is plainly able. Absence of indention and of lead means the virtual ction of the paragraph.

e depth of the page will be related to the length of line. The ure must be symmetrical, displaying a form pleasing to the A rectangle is more pleasing than a square.

rectangular page composed of lines of 10–11–12 words long enerally be satisfactory. It remains to add the running page- ng, and the folio. The page-heading may either range to ft and right in the opening (fixing the two pages as a unity); nge to the right and left; or it may be centred. The folio be centred at the foot, or range either way at the top or bot- but it cannot be centred at the top without abolishing the ng page headline. This may be done, but it is an undesirable ice. The running headlines may be set in capitals of the in upper- and lower-case of the text, or in any combination pitals. The use of full-sized capitals renders over-conspicuous petitive feature inserted for extrinsic convenience—that is, dentification of loose leaves. By reason of its position, the ine looks ragged if set in upper- and lower-case. It seems therefore, to employ small capitals; all capitals are best sep- d by hair spaces as their rectangular structure and pre- erance of perpendiculars tend to solidify the composition.

ll-sized capitals may well be used for chapter headings, the ber of the chapter being kept in small capitals, and both ations being hair spaced. The practice of dropping the chap- pening is justified by the fact that the eye, in travelling the generally occasional blank at the end of a chapter to the ning of the next, finds a companion blank an agreeable con- acy. It has also the psychological advantage of saving the r from feeling overpowered by the text. The rectangle of is so imposed upon the edge as to allow centre, head, fore- and tail margins of a dimension proportionate, first, to the h of line and, secondly, to the disposition of space at points e the text is cut into chapters, and where the body joins the tory and other pages known as "preliminaries." These last, strictly governed by convention than the text pages, offer naximum opportunity of design to be found in the volume.

e history of printing is in large measure the history of the page. The title when fully developed occupied a recto page, r partially or wholly; and the title-phrase, or a catchword has generally been set in a conspicuous size of type. Six- teenth century Italian printers generally used large capitals, copied from inscriptions, or more exceptionally, from caroline manuscripts; while English use followed the French in employing a leading line of large upper- and lower-case, followed by a few lines of pica capitals. Next came the printer's device, and at the foot of the page, his name and address. The large sizes of upper- and lower-case, being an inheritance from printers who were accustomed to black-letter (never set in solid capitals), have gone. The device also has vanished, except from the University Presses.

The contemporary title-page is a bleak affair; in nine out of ten cases the blank between the title and the imprint of the printer-publisher tends to be the most outstanding feature. When the device was first abandoned, the author, printer or publisher took advantage of the leisure of the reader and the blank at their disposal to draft a tediously long title, sub-title and indications of the author's qualifications, designed to fill the entire page. The present day publisher goes to the other extreme, reducing the title to as few short words as possible, followed with "by" and the author's name. A professional writer may insert, *e.g.*, "Author of *The Deluge*" under his name, but three and sometimes four inches of space separate this from the first line of the imprint. Consequently unless the title be deliberately set in a size of type out of all relation to that of the remainder of the book, this space is over-conspicuous. It is clear that a volume in 12-point does not require a 48-point title unless it be a 300-page folio in double-column.

Care for the typography of a book means care for its unity. There is no reason for a title-page to bear any line in a type larger than twice the size of the text-letter. If the book be set in 12-point, the title need be no larger than 24-point—or even slightly smaller. It should be set in spaced capitals as a rule. The author's name, like all displayed proper names, should also be in capitals. The headings to the preface, table of contents, introduction, etc., should be in the same size and fount as the chapter heads; and should be dropped if they are dropped. The order of these pages remains unsettled, except that all begin on a recto page. The logical order of the preliminary pages is half-title, title, dedication, contents, introduction, preface. This rule is applicable to most categories of books. Novels need neither table of contents nor list of chapters, though one or the other is generally printed. If it is decided to retain either, it would be reasonable to print it on the back of the half-title and facing the title page, so that the entire nature of the book will be indicated to the reader at a single opening. Where the volume is made up of a few short stories, their titles can be listed in the blank centre of the title-page.

Book Sizes.—In addition to fiction, belles-lettres and educational books are habitually published in portable, if not in pocketable formats, crown octavo $7\frac{1}{2}'' \times 5''$ (in America known as 12 mo) being an invariable rule for English novels published as such. The novel in the form of biography will be published as a biography, $6'' \times 8\frac{1}{2}''$, the size also for history, archaeology, science, art and almost everything but fiction. Novels are only promoted to this format when they have become "standard." Size, therefore, is the most manifest difference between books.

Another obvious difference is bulk, calculated in accordance with the publisher's notion, first, of the general sense of trade expectation, and, secondly, of the purchasing psychology of a public habituated to certain selling prices vaguely related to number of pages and thickness of the proffered volume. Inconsistently enough, weight does not enter into these expectations. These habits of mind affect the choice of fount and size of type, and may necessitate the adoption of devices for "driving out," *i.e.*, making the setting take up as much room as possible. By putting the running headline between rules or rows of ornaments; introducing unnecessary blanks between chapters; contracting the measure; exaggerating the spaces between the words and the lines; excessively indenting paragraphs; isolating quoted matter with picas of white space; inserting wholly unnecessary sectional titles in the text and surrounding them with space; contriving to drive a chapter ending to the top of a recto page so that the rest of it and its verso may be blank; using thick but not heavy paper; in-

creasing the depth of chapter beginnings and inserting very large capitals thereto; the volume can be inflated to an extra 16 pages —a feat which the able typographer accomplishes without showing his hand to the reader.

Limited editions of standard authors, or of authors who desire to rank as such, are commonly given a rubricated title. Under no circumstances, however, should red appear anywhere else in the work. Hand-made paper is generally used for editions-de-luxe, and none but the brave among typographers will disregard the superstitious love of the book-buying classes for its untrimmed, ugly and dirt-gathering rough edges. There is another category of limited edition produced by typographers working freely, without the handicap of trade conditions. These books are rapidly increasing in number, and use a wide variety of format, of type, of illustration and of binding.

Because, rather than in spite of, mechanical methods and standardization, printing is more various to-day than ever before. Whereas English books of whatever category of 20 years ago were printed in only three designs of type, no fewer than eight founts are employed to-day. It has been necessary that most of these are reproductions of classic old-faces, but it may well be that the near future will witness a real renaissance of type design based upon a sensitiveness to rightly-controlled type forms, and not animated by an uninformed curiosity for the original and the bizarre. (S. Mo.)

TYPOLOGY. Typology results from a study of the various kinds of objects fashioned by man and the sorting of them into categories. The objects in each category can be often further classified, a geographical, chronological or evolutionary basis being taken. For example, in the case of artefacts made by primitive man in the Fiji islands the typologist might begin by sorting out all the paddles. These would then be further classified according to their locality and age. On studying such a group of objects it is often possible to make out an evolutionary series in a tool family, a certain type being clearly derived from an earlier one and itself the parent of some further development.

In prehistory, a typological study of the artefacts made by man is one of the four methods which yield information before written documents existed; the other three being stratigraphy (*q.v.*), a study of the state of preservation of the artefacts found, and of the objects associated with them. The two latter methods are useful as checks on the information obtained from stratigraphy and typology.

Although as shown above typology sometimes enables us to determine a chronological sequence, this is primarily obtained by the stratigraphical method; typology enables us to study systematically the industries belonging to the various cultures. By noting the peculiarities of the various tools which make up the industries we obtain type standards for each culture with which new finds, otherwise undatable, can be compared. Thus, it is found by experience that a particular implement, viz., the beaked burin, is almost exclusively confined to industries which on stratigraphical and other grounds, can be assigned to a Middle Aurignacian culture. If then a new industry is discovered otherwise undatable, but including a large number of beaked burins, we can assume, with some probability, that the age is Middle Aurignacian. Again, a certain type of celt, showing a rectangular cross-section and elaborate trimming, can at once be recognized not only as being of Scandinavian origin, but also as belonging to a definite period of late Neolithic date.

Typology can be applied to styles and techniques of painting. Thus, for example, in Southern Rhodesia palimpsests of Bushman paintings occur. The typologist can observe several different styles which are always found occurring in the same stratigraphical sequence, painted one over the other. In this way a succes of art styles has been determined. (M. C. B.)

TÝR, the Scandinavian god of battle, was not such a pr nent figure in Northern mythology as among other Teut peoples. In Anglo-Saxon he was called Ti (*Ti, Tiig,* gen. *Ti* whence "Tuesday") and equated with the Roman Mars. Teutonic name is the same as the word for "god" in several I European languages, *e.g.,* Lat. *dīuus,* Lith. *dēvas,* Skr. *de* even in Old Norse the plural (*tívar*) was still used in the s sense. (*See* TEUTONIC PEOPLES, s. *Religion, ad fin.*)

TYRANNOSAURUS: *see* DINOSAUR.

TYRANT, a term applied in modern times to a ruler cruel and oppressive character (Gr. τύραννος). This use is ba on a misapprehension of the Greek word, which implied n ing more than unconstitutional sovereignty. Such rulers not confined to a single period, the 7th and 6th centuries (the so-called "Age of the Tyrants" [*see* GREECE: *History*]), appear sporadically at all times. The use of the term "tyr in the bad sense is due largely to the ultra-constitutionalist the 4th century in Athens, to whom the democracy of Per was the ideal of government. Thus the government which sander set up in Athens at the close of the Peloponnesian is called that of the "Thirty Tyrants" (*see* CRITIAS).

TYRAS, a colony of Miletus, founded about 600 B.C., s 10 m. from the mouth of the Tyras (Dniester). The types o coins suggest trade in wheat, wine and fish. During the century B.C. it fell under the dominion of native kings. It destroyed by the Getae about 50 B.C. In A.D. 56 it seems to been restored by the Romans and henceforth formed part of province of Lower Moesia. Its coins now display heads of perors from Domitian to Alexander Severus. Soon after the of the latter it was destroyed by the Goths. Its government in the hands of five archons, a senate, a popular assembly a registrar. The few inscriptions are mostly concerned with tr Its remains are scanty, as its site is covered by the media fortress of Monocastro or Akkerman (*q.v.*).

TYRCONNEL, RICHARD TALBOT, EARL (TITU DUKE) OF (1630–1691), Irish Jacobite, son of Sir William Ta (d. 1633), a Roman Catholic lawyer and politician, served royalist in the Great Rebellion, and was present at the storm of Drogheda by Cromwell (Sept. 3, 1647), afterwards esca to Spain. He was arrested in London in Nov. 1655 for actin agent in plots to upset the Commonwealth, but escaped once m After the Restoration he was employed in the household of duke of York (James II.) even after his participation in intrigue to ruin the character of Anne Hyde, the duke's In 1678 he was arrested in connection with the Popish plot a tion, and went into exile for a time. During the reign of Ja he was appointed commander-in-chief in Ireland and cre earl of Tyrconnel (1685); in Feb. 1687 he was appointed deputy. Tyrconnel, who foresaw the revolution in Engl intrigued for the handing over of Ireland to France, in the inte of the Roman Catholics, and in 1688, when James fled to Fra after the battle of the Boyne, Tyrconnel was left to carry on struggle against William III. When the latter raised the sieg Limerick Tyrconnel fled to France for help. On his return Ireland, in Jan. 1691, he was of little use, and was compelle retire to Limerick, where he died on Aug. 14, 1691. In James created him duke of Tyrconnel, but the title was recognized by the Jacobites.

TYRCONNELL (*Tir-Conaill*), an ancient kingdom of land. Conall Gulban, a son of Niall of the Nine Hostages, kin Ireland, acquired the wild territory in the north-west of U (the modern Co. Donegal, etc.), and founded the kingdom a the middle of the 5th century. Of the several branches of family, the O'Connells, O'Cannanans and O'Dohertys may mentioned. The kings of Tyrconnell reigned until 1071.

TYRE, a famous seaport of Phoenicia, now in the Stat Great Lebanon, in French mandated territory (mod. *Sur*); p 5,700. Tyre is built on a peninsula, formerly an island, has

eets and evident traces of antiquity in the material of lings. Of the two harbours which it formerly possessed, hern, or Sidonian, still survives; the southern, or Egyptian, appeared. Once the great mart of the Mediterranean t has now an insignificant export trade in cotton and It has a French garrison and a French adviser.

ory.—The name Usu (Ushu), the designation of the main- n, appears in the Tell el Amarna letters (14th century nd in Papyrus Anastasi I. (13th century). As it is not the list of Syrian cities tributary to Thutmoise III. (15th B.C.), it is reasonable to conclude that it was founded he beginning of the 14th century, but not before the be- of the 15th. The earliest settlement, a colony of Sidon was in all probability divided between the mainland and nd. The building of a causeway connecting the island e shore is attributed to Hiram, well known as the king of ho had commercial dealings with Solomon and supplied abour and material for the erection of the temple at Jeru- Jezebel was a daughter of Ethbaal, a Tyrian king.

her island fortress, Tyre, the mistress of the seas, could r enemies and for the most part Assyrian and Babylonian pent itself against her defences in vain. e of, by Alexander the Great (332 B.C.).—After the of Issus, Alexander, as he marched southwards towards called upon the Phoenician cities to open their gates, as it rt of his general plan to deny their use to the Persian fleet. tizens of Tyre, who owed allegiance to the king of Persia, l to do so, whereupon he laid siege to the city. New Tyre ilt on a small island, about half a mile from the main land which the old city stood. Possessing no fleet Alexander shed old Tyre, and with the *débris* built a mole 200ft. in n across the straits, and erected towers and war engines at ther end. Thereupon the Tyrians destroyed the towers by ps and damaged the mole. Many curious devices were made to defeat the Greeks, such as pots of burning naptha and r, and red-hot sand hurled from catapults. Alexander next d the mole and rebuilt the towers, but he saw that without nce of a fleet success could not be assured since the s had free access to the sea. From Sidon he obtained 80 cian ships, and 24 from Rhodes, Mallus, Soli, Lycia and onia. Then the king of Cyprus, hearing of the defeat of at Issus, joined Alexander with 220 warships. The reduc- Tyre was now but a matter of time, for if the assault from the mole proved unsuccessful, starvation must accomplish its work. Alexander was, however, impatient to complete the siege before Darius could raise another army, so he constructed floating batteries upon which rams were mounted, and forced his way into the Egyptian and Sidonian harbours, and scaled the city walls. Thus after a siege of seven months the city was taken, 8,000 of the citizens were slaughtered, 2,000 later on executed, and 30,000 sold into slavery.

TYRE. The tyre of a wheel is the outer circumferential portion that rolls on the ground or the track prepared for it. Railway vehicle wheels usually have hard steel tyres, which together with the hard steel rail give the maximum endurance and the minimum rolling resistance. The common tyre made for the exterior rim of non-motor road-vehicles serves to hold together the parts of the wheel and resists wear in travelling. It is ordinarily made of iron or steel, and consists of a flat hoop formed so as to fit tightly over the exterior of the wheel; it is expanded by heat and placed on the wheel while hot so that when cooled it is tightened by contraction. It may also be bolted to the rim of the wheel. The chief considerations are strength and durability. In bicycles, motorcars, and other road vehicles in which freedom from vibration and shock is desired, solid or pneumatic rubber tyres are employed.

The principle of the pneumatic tyre was patented by Robert William Thompson in England in 1845, in France the following year and in 1847 in the United States. Thompson's patent substantially covers the tyre as it is known to-day. It showed a non-stretchable outer cover and an inner tube of rubber to hold air. An early set of tyres made on this basis covered 1,200 miles when placed on an English brougham.

Almost half a century later, when the bicycle became popular, pneumatic tyres were revived by John Boyd Dunlop of Belfast, Ireland. He obtained certain patents in 1888 and 1889 on English bicycle tyres. A year after Dunlop's patents were issued, Charles K. Welch patented a tyre shoe of fabric having wire edges and a rim to clinch the shoe and hold it to the felloe of the wheel. About this time, William Erskine Bartlett, an American living in England, patented a tyre which did not necessitate wire clinchers. The thread or cord tyre was patented by John Fullerton Palmer in England. Pneumatic tyres were first applied to motor-vehicles by a firm of French rubber manufacturers, Michelin and Company. After some improvements were made, rubber tyres were adopted by Panhard and Levassor and other French automobile manufacturers.

RUBBER TYRE MANUFACTURE

Rubber tyres may be considered in two classes—

(a) Solid or cushion tyres being those in which the rubber compound of which they are formed, fulfils the combined functions of carrying the load, absorbing the shocks of meeting road surface irregularities, and resisting abrasion.

(b) Pneumatic tyres—being those in which the load is carried and the shocks absorbed by compressed air. The structure of the pneumatic tyre is primarily designed to provide a non-extensible covering with air-proof lining to contain and restrain under compression the column of air. This covering is provided with a rubber tread portion which takes up the abrasive wear of road contact and protects the contained column of compressed air. Such a structure has, as distinct from a solid rubber or cushion tyre, no capacity in itself either to carry load or to absorb shocks. It is entirely dependent on the contained compressed air to enable it to function, and is therefore correctly named a "pneumatic" tyre.

Solid Tyres have been made in a wide variety of forms, and have been developed from a mere covering of the periphery of small wheels with a strip of vulcanised rubber, and the cementing of a round cord of solid rubber into a concave metal rim, as in the earliest forms of rubber tyres used on bicycles and tricycles, to the modern solid and cushion tyres used on the heaviest types of modern road transport.

Solid rubber tyres have been made for all types of road vehicles; they were the equipment of the earliest motor cars.

The many forms in which they were produced, differed principally in the adaptation of the tyre to a method of attachment to the wheel. In the main, the attachments have been of two types, one in which the tyre was provided along the sides of the base with beads or recesses which were adapted to engage with lips or inturned edges formed on the metal rim. This form of tyre and rim was used mainly in the smaller sizes for lighter work. The stresses imposed by the heavier and faster motor vehicles demanded a fixing which secured the whole base of the tyre to its rim, and this resulted in the production of the metal base band type in which the rubber tyre is mounted on and vulcanized to an endless metal ring of the full width of the base of the tyre. Such metal base-bands have to be of a substantial thickness to withstand the hydraulic pressure used to force the band with its tyre over the periphery of the wheel. A pressure of 10 to 30 tons is employed for this purpose, and a tyre so applied remains fixed to its wheel for the period of its life.

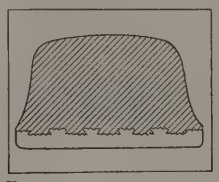

FIG. 1.—STANDARD SOLID RUBBER TYRE

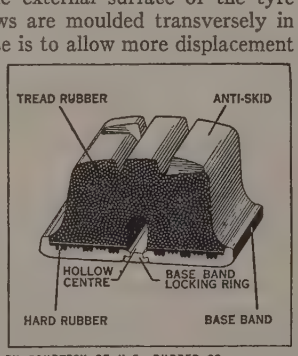
Simple though the structure of a solid tyre may appear, it is really one of the most difficult problems of the tyre manufacturer. The difficulties lie in combining in one tyre a rubber compound which, whilst having reasonable cushioning properties, is capable of carrying heavy loads at the high speeds of modern road transport. This demands a rubber compound with a maximum resistance to abrasion and cutting, which will also best resist the development of high internal temperatures under the pounding of high speed running on the road.

There are limits to the capacity of rubber compounds in these directions, which is one of the factors now tending to the displacement of solid rubber tyres by large pneumatic tyres.

Cushion Tyres.—This is a title somewhat loosely applied to variations of the solid rubber tyre in which the object of the maker is to provide a tyre which will deflect more under its running load, and yield more to shocks than the solid tyre.

Solid tyres have thus been made from a much softer rubber compound. Another device is the provision of cavities in the mass of the solid tyre. In some cases the cavities take the form of circumferential hollows moulded in the centre of the tyre; in other types hollows are moulded in the external surface of the tyre walls; and again in others, hollows are moulded transversely in the tyre section. In all, the purpose is to allow more displacement of the tyre tread under a given load. This provides greater cushioning against shocks, but of course, the load carrying capacity of the tyre is reduced.



BY COURTESY OF U.S. RUBBER CO.

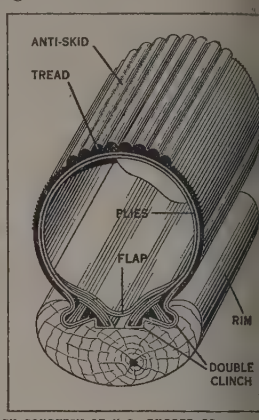
FIG. 2.—CROSS SECTION OF CUSHION TRUCK TYRE SHOWING LOCKING RING

The principal attraction of the cushion tyre to users, is the freedom from the risk of failure by puncture associated with the use of pneumatic tyres. The improving pneumatic tyre is gradually displacing both cushion and solid rubber tyres.

Pneumatic Tyres.—Whilst Thompson (Patent No. 10990 of 1845) was the first to conceive the possibility of supporting a road vehicle on a contained column of compressed air, and did in fact equip a horse-drawn brougham with 5 in. air-inflated tyres, it was to J. B. Dunlop (Patent No. 10607 of 1888) that the introduction of the pneumatic tyre must be credited; for from the production of his first crude inflated tyres at Belfast in 1888, the manufacture of pneumatic tyres has continued without break, with constant improvement in the product, until today it is essential to all high speed road motor transport, and has remained since its introduction the only equipment of cycles of all forms.

The simplest form of pneumatic tyre is that known as single-tube tyre. It consists of an endless tube of rubber-coa cotton fabric having on its inner face an air-proof rubber lin and on its outer surface a covering of rubber sufficient at the b and sides to protect the fabric from wet or damage, with an ad tional thickness of rubber on the tread portion to resist r wear, the whole being vulcanised together in a mould under fl pressure supplied to the inside of the tyre.

Repair of single tube tyres is effected in the case of small punctures by injecting a quick drying rubber solution through the puncture, but in the case of serious cuts or damages, necessitates the attention of an expert workman and involves revulcanization of the repair. Tyres of this type have disappeared from use, except in America where they are still used on bicycles. They never had any considerable use as equipment for motor cars.



BY COURTESY OF U.S. RUBBER CO.

FIG. 3.—CROSS SECTION OF DOUBLE CLINCHER BICYCLE CAS AND RIM

The necessity for a ready means of repairing punctures resulted in tyres taking the form of a separate inflatable inner tube, with a detachable outer cover. Out of a multitude of types of detachable covers introduced the early nineties, two emerged—the *Wired On* type and *Beaded Edge* type.

The *wired on* type quickly secured a dominating position respect to cycle tyres, but in the earlier years of the motor dustry it was the *beaded edge* type which was universally us The advantages of the *wired* type of tyre for use on mo vehicles were recognised for a considerable period, but the ra growth of the motor car industry made it very difficult to int duce a type of tyre demanding a rim differing from that so g erally in use for the *beaded edge* type of tyre. Protracted co petition over a period of years has only recently resulted i complete victory for the *wired edge* type of tyre. The *beaded e* has now been almost entirely dropped.

With the standardization of all tyres to one type (the *wired straight side* type) the design of rim applicable to such tyres

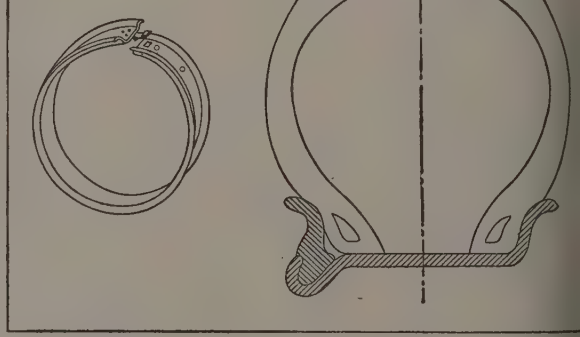


FIG. 4.—WIRED OR STRAIGHT SIDE PNEUMATIC TYRE ON FLAT BA RIM WITH DETACHABLE FLANGE

undergone some change. In America the straight-side rim of flat base type has been most commonly used. Its construct varies principally in the method of mounting the tyre and attaching the rim to the wheel. Some of these rims are made w a loose flange of a self-locking type; some have two loose flan with a separate locking ring; and there is also the transvers split type. They all require the use of a "flap" or band of rub

ubberized fabric to cover the line of contact between the s and the rim to prevent chafing of the inner tube. A rim h embodies the principle of the Welch tyre of 1890, and h has been continuously used for cycle tyres and known as *well base* or *drop centre* rim, has now been largely adopted motor cars in England, and to a limited extent in America. rim has neither the loose flange, nor the transverse split. These *well base* rims are much lighter and less complicated than the flat base rims, and enable the tyres to be very readily and easily mounted and dismounted. The method is well known to all cyclists, and may be briefly described as depressing the endless wired edge of the tyre into the *well* of the rim at one point in its circumference—this allowing the wired edge to be lifted over the *edge* of the rim at the opposite point of its circumference.

5.—CROSS SECTION OF A R COACH PNEUMATIC TYRE, AND RIM

Cord and Canvas Tyres.—Nearly all pneumatic tyres today, whether for cycles, motor cycles, private cars, buses or commercial vehicles, are cord tyres; that is to say, the use of a fabric constituted wholly or al- wholly of warp, is universal.

gh Pressure and Low Pressure (or Balloon) Tyres.—When r tyres were being almost exclusively made of square woven n fabric, the dimensions of the various sizes of tyres re- d for carrying certain loads had become fairly well stabilised, equally the inflation pressures necessary for each size of tyre lso been uniformly accepted.

e superiority of the cord type, due partly to the cord con- tion and partly to its increased sectional dimensions led to er developments in which the sectional sizes of tyres were further increased; and, as the larger the section of the tyre oyed to carry a given load the lower the inflation pressure sary within that tyre to support the load, these larger tyres be made with considerably thinner retaining casings be- of the lower inflation pressure which they had to withstand. ch larger tyres quickly received the name of *balloon* tyres— e naturally suggesting itself to an observer struck by the rmal dimensions of the tyre. The name *balloon* quickly be- very generally applied to yres of larger sectional di- ions and employing lower ures.

e *balloon* or *low pressure* r tyre has demonstrated its ior cushioning properties to rists generally, and to-day ressure tyres are the stand- equipment of all private

is commonly the case when ange of this character is , there was a tendency to go tremes. Many of the first ressure tyres were made with casings of extreme thinness, the result that the disadvantage of extremely thin casings of argest dimensions quickly demonstrated the disadvantages ch tyres under average service conditions. Their liability to ental damage was too marked; they required the maintenance ir inflation pressure within very close limits, and a small de- re from the proper figure resulted in excessive and erratic wear and frequently produced serious difficulties in the steer- ntrol of vehicles.

wever, these difficulties have all been overcome, and the ard tyre equipment today represents only a small sectional

increase in dimensions over the original cord tyres, now referred to as *high pressure* tyres, and the inflation pressures commonly used are of an order intermediate between those pressures employed in high pressure cord tyres, and those used in some of the earlier balloon tyres, the result being that the user today secures an improved cushioning without sacrificing anything of the durability of the high pressure cord tyre.

Precisely similar development in respect to the pneumatic tyre equipment employed upon the heavier types of passenger and goods-carrying vehicles is also being carried out, and in this case makers are profiting by their earlier experience with low pressure tyres for private cars in avoiding extremes both in dimensions, casing thinness and lowness of inflation pressure.

FIG. 7.—CROSS SECTION OF A STRAIGHT SIDE AEROPLANE TYRE ON A DROP CENTRE RIM

Briefly, the construction of a pneumatic tyre can be summarized as consisting in—first, the preparation of the cord material, which is now a specialized operation on which many of the largest cotton mills in the world are exclusively employed. The cord, after passing from the cotton mills, is first treated in the tyre factory by a coating of rubber applied to both sides of the sheets of cord fabric. These rubberized sheets are then cut into bias strips of suitable widths, and brought to case building machines on which the casing is built up, and the wire rings which retain the finished cover upon its rim, are enclosed within the edges of the casing. Various details of fabric and rubber are added in the form of chafing strips, filler strips, rubber insulation plies and cotton breaker strips, and finally the tread and side wall coverings are added, the whole forming a tyre cover in a raw state.

In some cases this structure is built up to approximately its finished shape, and in others is built up as a wide flat endless band which is afterwards given its approximate finished shape by being subjected to a separate shaping process.

Such covers are then mounted upon an inflatable bag, and the whole enclosed in steel moulds. The moulds are then introduced into a vulcanising vessel, where the bag within the raw tyre is inflated with air, steam or hot water, according to the particular process used, and the whole subjected externally to high temperature steam which effects a process known as "vulcanisation." Heat is supplied for vulcanising only from outside the moulds when air is used in the bags. When hot water or steam is used the tyre is heated from both sides and more uniform heating throughout the tyre is secured. Leakage of air into the steam around the moulds will reduce the heat transfer seriously and cause irregularities of vulcanisation. This process of vulcanisation under pressure results in the moulding of the tyre into its finished form, uniting all parts firmly together, and producing within the rubber mass certain reactions between the rubber and the sulphur and other ingredients which have been previously incorporated in the rubber, resulting in a tough and durable product.

Inner tubes are made by various processes—all of which, however, necessitate the formation of the tube first in the raw state from a mixture of rubber with the necessary vulcanising and compounding materials. Such a raw tube is afterwards vulcanised, sometimes on tubular mandrels and sometimes in closed metal moulds. The tubes are, of course, fitted with non-return valves.

Non-skid Devices.—In the earlier days of the pneumatic tyre, treads were plain and no attempt was made to provide any greater hold upon road surfaces than that due to the coefficient of friction as between rubber and road surface.

An early attempt, popular for many years, to avoid slipping difficulties, consisted in providing the tyre tread with several rows of hardened steel studs. These were efficient on certain

types of road surface, but were highly dangerous on others.

Modern tyres are invariably provided with some form of design moulded into the rubber of the tread. The designs employed are numerous, each maker has his own design; in fact, frequently a number of designs, although it is difficult to find in many of them any special advantages. The value of the non-skid varies greatly in relation to the particular type of road surface on which it is running, and a design will vary in its ability to resist a forward slip or a side slip, or a combination of both. The tyre maker has of necessity to consider in his tread design, in conjunction with the wearing capacity of the tread as a whole, not its non-skidding properties alone, but its average capacity for holding the road surface under all conditions.

Rolling Resistance in Tyres.—The rolling resistance of all tyres, whether of the solid, cushion or pneumatic type, is affected by a number of different factors which may be divided into two groups—

(1) Internal factors.
(2) External factors.

1. *Internal Factors.*—

(a) *Solid and Cushion Tyres.*

The type of rubber used is the most important factor. High internal friction will cause rapid heating of the tyre and may possibly lead to internal disintegration. The condition is aggravated if the rubber is soft and the tyre runs under a large deflection. A high heat conductivity is also desirable so that the heat generated has the best possible chance of escaping to its surroundings.

The power consumption of a solid tyre of 120 mm. section running at 20 m.p.h. under a load of 3,300 lb. may vary from 0·5 h.p. to over 2 h.p. according to the quality of the rubber mixing used.

(b) *Pneumatic Tyres.*

About 50% of the power losses in a pneumatic tyre occur in the tread, and in selecting the tread quality, this point must be borne in mind.

Other internal factors affecting pneumatic tyres are the type and thickness of insulation rubbers used between the fabric layers and the type and method of building of the materials used in the casing.

2. *External Factors.*

Both in solid and pneumatic tyres, the power consumption of a given tyre is very nearly proportional to its speed; other things being equal.

Increase in the load causes an increase in the running deflection and a consequent increase in power consumption. In pneumatic tyres a reduction of inflation pressure produces the same effect.

A hot tyre has a lower rolling resistance than a cold tyre; consequently, if a tyre is run at a constant speed as it warms up the power consumed falls off until it eventually reaches a steady value at which the amount of heat generated is just sufficient to balance the losses by radiation and conduction.

In the case of touring cars running at normal speeds, the power losses in the tyres do not represent more than 30 or 40% of the total power losses in the whole car. The power consumed by small cord tyres (3″–4″ in section) under normal conditions of load and inflation pressure and at a speed of 25 m.p.h. is of the order of 0·6 to 0·9 h.p. per tyre.

The four 6″ tyres of a heavy racing car travelling at 200 m.p.h. may absorb as much as 15 h.p. each, or a total of 60 h.p.

BIBLIOGRAPHY.—Most of the published matter dealing with tyres, takes the form of articles concerned with purely technical phases of the processes of manufacture and the preparation of materials, etc. These are to be found in the various technical journals associated with the rubber manufacturing, chemical and motor car industries. Of published work dealing with tyres themselves, the following are of the most general interest: A. Michelin, "The Pneumatic Tyre: Its Application to Autocars and Horsedrawn Carriages" (paper read before the French Society of Civil Engineers), in *The Autocar* vol. i. pp. 495, 507, 522, 534, 545, 567, 603, 698 (1895); S. F. Edge, "Pneumatic Tyres as Applied to Automobiles" (paper read before the Automobile Club), in *The Autocar*, vol. iv. pp. 213–218 (March 1899); W. H. Paull, "Pneumatic Tyre" (paper read before Cycle Engineer's Institute) in *Proceedings* Cycle Engineer's Institute, pp. 44–70 (1901); H. C. Pearson, *Rubber Tires and all about Them* (New York, 1906); A. Healey, "The Tyre Part of the Suspension System" (London, 1926), reprint of paper read before the Institute of Automobile Engineers, 1924; C. Macbeth "Pneumatic Tyres for Heavier Loads," *Journal of Institute of Automobile Engineers*, pp. 549–562 (March, 1926); W. L. Holt and P. L. Wormeley, "Endurance Tests of Tyres," U.S. Bureau of Standards *Technological Papers*, vol. xx. No. 318, pp. 545–551 (May 1926); H. C. Duncan, "The Story of Pneumatic Tyres, Experiments, Patents and Finance," *World on Wheels*, pp. 583–622 (Paris, 1926); W. C. Geer "The Bicycle Tyre, Pneumatics and Solids," *Reign of Rubber*, pp. 120–167 (London, 1926); H. C. Pearson, "Pneumatic Tires," *An Encyclopedia of Tyre Manufacture, History, Processes, Machinery, Modern Repair and Re-building, Patents, etc.* (New York, 1926); "Tyres and the Causes of Tyre Wear," *Journal of Society of Automotive Engineers*, vol. xx., pp. 790–792 (1927); "Use and Care of Automobile Tires," U.S. Bur. of Standards *Circular No. 341* (1927). (W. H. P.)

TYREE, island of the Inner Hebrides, Argyllshire, Scotland. Pop. (1921), 1,716. It is situated fully 2 m. S.W. of Coll, the isle of Gunna lying in the channel between the two islands, and has an extreme length from north-east to south-west of nearly 12 m. and a breadth varying from ¾ m. to 4¼ m. Carnan Mor (46 ft.) is the highest point; there are several lakes. On the south-western point of Balephuill bay are ruins of St. Patrick's temple besides duns and chapels; an ancient underground dwelling was found in 1916. Steamers call from Oban regularly at the small harbour of Scarinish. Horses are bred on the island. Marble has been worked. Skerryvore, a lonely rock in the Atlantic, with a lighthouse, 14 m. south-west, belongs to the parish of Tyree.

TYROL: *see* TIROL.

TYRONE, EARLS OF: *see* O'NEILL, IRISH FAMILY.

TYRONE, a county of Ireland in the province of Ulster, bounded north and west by Donegal, north-east by Londonderry, east by Lough Neagh and Armagh and south by Monaghan and Fermanagh. The area is 806,658 acres or about 1,260 sq.m. Pop. (1926) 132,777. Running along the north-eastern boundary with Londonderry are the schist ridges of the Sperrin Mountains (Sawel, 2,240 ft., and Meenard, 2,061 ft.). Most of the south of the county is occupied by sandstone formations. Mullaghcarn, north-east of Omagh, reaches 1,778 ft. South of Clogher a range of hills, reaching 1,255 ft. in Slieve Beagh (Upper Carboniferous sandstones and shales), forms the boundary between Tyrone and Monaghan.

From Coalisland to Dungannon true Coal Measures appear. This coalfield includes one seam 9 ft. thick at Coalisland; less important coals occur in the Millstone Grit series at Dungannon. The field doubtless continues eastward under the Triassic sandstone that stretches towards Lough Neagh. The pale clays probably Pliocene, of the southern shore of the lake cover the flat land east of Coalisland, and are several hundred feet thick. North of Stewartstown, near Tullaghoge, a very small patch of Magnesian limestone contains Permian marine fossils; and, farther north, the county includes part of the basaltic plateaux, protecting Chalk, which extend into co. Londonderry.

The Foyle forms a small portion of the western boundary of the county, and receives the Mourne, which flows northward by Newton Stewart. The principal tributaries of the Mourne are the Strule (constituting its upper waters), the Derg from Lough Derg, and the Owenkillew, flowing westward from Fir Mountain. The Blackwater rises near Fivemiletown and forms part of the south-eastern boundary of the county with Monaghan and Armagh. Lough Neagh bounds the county on the east. Lough Fea is situated in the north-west, and there are several small lakes near Newtown Stewart.

Tyrone became a principality of one of the sons of Niall of the Nine Hostages in the 5th century, and from his name—Eogan—was called Tir Eogan, gradually altered to Tyrone. From Eogan were descended the O'Neals or O'Neills and their numerous septs. The family had their chief seat at Dungannon until the reign of Elizabeth, when it was burned by Hugh O'Neill to prevent it falling into the hands of Lord Mountjoy. The earldom of Tyrone had been conferred by Henry VIII. on Conn O'Neill but on his death, when the earldom should have descended to his heir Matthew, baron of Dungannon, another son, Shane, was pre-

ed chief with the consent of the people. Shane defied English
rity, but his forces were defeated near the river Foyle in
and shortly afterwards he was himself killed. Tyrone was
of the counties formed at Sir John Perrot's shiring of the
ormed parts of Ulster; but his work was interrupted by the
of Hugh O'Neill in 1596. During the insurrection of 1641
lemont Fort and Dungannon were captured by Sir Phelim
ill, and in 1645 the parliamentary forces under General
o were defeated by Owen Roe O'Neill at Benburb. At the
lution the county was for a long time in the possession of
orces of James II.

ths are numerous in the county. There is a large cromlech
Newtown Stewart, another at Tarnlaght near Coagh and
er a mile above Castlederg. At Kilmeillie near Dungannon
wo stone circles. There are some ruins of the ancient castle
e O'Neills, near Benburb; mention may also be made of the
of the castles of Newtown Stewart, Dungannon, Strabane
Ballygawley. The hill pastures support a large number of
g cattle. Oats, potatoes and turnips are the principal crops.
cultivation of flax, formerly an important industry, has
ly deteriorated. Poultry-keeping is a growing industry. There
nanufactures of linens and coarse woollens (including blan-
; brown earthenware, chemicals, whiskey, soap and candles
lso made. There are a few breweries and distilleries.

anches of the Great Northern railway from Portadown (Co.
agh) and Dungannon in the south-east, and from Enniskillen
Fermanagh) and Fintona, unite at Omagh, whence a line
eeds north by Newtown Stewart and Strabane to London-
. From Dungannon a branch runs north to Cookstown,
e it joins a branch of the Northern Counties (Midland)
ay. From Victoria Bridge on the Londonderry line the
ederg light railway serves that town. The south of the
ty is served by the Clogher Valley light railway. Water com-
cation includes Lough Neagh, and the Blackwater entering it,
navigable to Moy, whence the Ulster canal skirts the boundary
e county with Co. Armagh to Caledon.

e administrative counties of Tyrone and Fermanagh together
n 8 members to the Parliament of Northern Ireland and 2
bers to the Parliament of Great Britain.

YRONE, a borough of Blair county, Pennsylvania, U.S.A.,
. N.E. of Altoona, on the Little Juniata river and Federal
ways 220 and 322; served by the Pennsylvania railroad. Pop.
) 9,084 (94% native white); 1928 local estimate 12,000.
borough is 910 ft. above sea-level, in an agricultural and
ering district, with deposits of limestone, iron and zinc.
a distributing point for coal from the Clearfield region. The
e was platted in 1851 and incorporated in 1857.

YRRELL, GEORGE (1861–1909), Irish divine, was born
blin on Feb. 6, 1861. He was educated under Dr. Benson at
mines School and entered Trinity College in 1878. He was
ly influenced by the writings of Cardinal Newman, and early
79 entered the Roman Catholic Church. In 1880 he joined the
ty of Jesus and became teacher of philosophy at Stonyhurst.
ad a keen sympathy with the difficulties experienced by the
ary lay mind in trying to reconcile the conservative element in
olicism with the principle of development and growth, and in
Faith of the Millions, Hard Sayings and *Nova et vetera* he
pted to clear them away. Tyrrell privately circulated among
iends writings in which he drew a clear line of distinction be-
n religion as a life and theology as the incomplete interpre-
n of that life. One of these, the *Letter to a Professor of*
ropology, was translated without his knowledge into Italian,
xtracts from it were published in the *Corriere della Sera* of
n in Jan. 1906. For at least eight years before this he had
more or less in conflict with the authorities of his order,
gh his sympathy with "modernist" views, but the publication
is letter (afterwards issued by Tyrrell as *A Much Abused*
r) brought about his expulsion from the order in Feb. 1906.
conflict," he wrote, "such as it is, is one of opinion and ten-
es, not of persons; it is the result of mental and moral
sities created by the antitheses with which the Church is
ling in this period of transition." Tyrrell found no bishop to give him an ecclesiastical status and a *celebret,* and he never regained these privileges. In July 1907 the Holy Office published its decree condemning certain modernist propositions, and in September the pope issued his encyclical *Pascendi Gregis.* Tyrrell's criticism of this document appeared in *The Times* on Sept. 30 and Oct. 1, and led to his virtual excommunication from the Church. On July 6, 1909, he was suddenly taken ill, on the 10th he received conditional absolution from a priest of the diocese of Southwark, and on the 12th extreme unction from the prior of Storrington. His intimate friend, the Abbé Brémond, gave him absolution, being with him at his death on July 15, 1909.

His works include: *Lex Orandi* (1903); *Lex Credendis* (1906); *Through Scylla and Charybdis* (1907); *Mediaevalism* (1908); and *Christianity at the Cross Roads* (1909).

See the estimates by Baron F. von Hügel and Rev. C. E. Osborne in *The Hibbert Journal* for Jan. 1910; also the obituary in *The Times* (July 16, 1909), and the *Life,* by M. D. Petre.

TYRRELL, SIR JAMES (d. 1502), the supposed murderer of the English king Edward V., and of his brother Richard, duke of York, was a son of William Tyrrell and a grandson of Sir John Tyrrell (d. *c.* 1437), who was treasurer of the royal household and was on three occasions Speaker of the House of Commons. The family is said to descend from Walter Tirel, the murderer of William Rufus. During the Wars of the Roses James Tyrrell fought for the Yorkists; in 1471 he was knighted; and in 1477 he was member of parliament for Cornwall. With regard to his share in the murder of the prince in 1483 he appears to have been selected by Richard III. and sent to the Tower of London, where he supervised the crime which was carried out by his subordinates. Afterwards he received several appointments from Richard and was sent to Flanders. He was also employed by Henry VII. and was made governor of Guisnes, but he seems to have incurred the king's displeasure through his friendship with Edmund de la Pole, earl of Suffolk. Having been treacherously seized he was conveyed to England and was executed on the 6th of May 1502. Just before his death he made a confession about the murder of the princes.

TYRTAEUS, Greek elegiac poet, lived at Sparta about the middle of the 7th century B.C. According to the older tradition he was a native of the Attic deme of Aphidnae, and was invited to Sparta at the suggestion of the Delphic oracle to assist the Spartans in the second Messenian war. Later accounts reject his Athenian origin but it is admitted that Tyrtaeus flourished during the second Messenian war (*c.* 650 B.C.)—a period of musical and poetical activity at Sparta, when poets like Terpander and Thaletas were welcomed—that he not only wrote poetry but served in the field, and that he endeavoured to compose the internal dissensions of Sparta (Aristotle, *Politics,* v. 6). About 12 fragments (three of them complete poems) are preserved. They are mainly elegiac and in the Ionic dialect, written partly in praise of the Spartan constitution and King Theopompus (Εὐνομία), partly to stimulate the Spartan soldiers to deeds of heroism in the field (Ὑποθῆκαι—the title is, however, later than Tyrtaeus). The interest of the fragments preserved from the Εὐνομία is mainly historical, and connected with the first Messenian war. The Ὑποθῆκαι were very popular in the army (Athen. xiv. 630 F.). Of the marching songs (Ἐμβατήρια), written in the anapaestic measure and the Doric dialect, only scanty fragments remain.

Verrall (*Classical Review,* July 1896, May 1897) definitely places the lifetime of Tyrtaeus in the middle of the 5th century B.C., while Schwartz (*Hermes,* 1889, xxxiv.) disputes the existence of the poet altogether; *see* also Macan in *Classical Review* (Feb. 1897); H. Weil, *Études sur l'antiquité grecque* (1900), and C. Giarratani, *Tirteo e i suoi carmi* (1905). There are English verse translations by R. Polwhele (1792) and imitations by H. J. Pye, poet laureate (1795), and an Italian version by F. Cavallotti, with text introduction and notes (1898). The fragment beginning Τεθναμέναι γὰρ καλόν has been translated by Thomas Campbell, the poet.

TYRWHITT (tĭr'ĭt), **THOMAS** (1730–1786), English classical scholar and critic, born March 27, 1730, in London, where he died Aug. 15, 1786. He was educated at Eton and Queen's college, Oxford. In 1756 he was appointed under-secretary for war, in 1762 clerk of the House of Commons. His principal classical works are: *Fragmenta Plutarchi II. inedita* (1773), from a Harleian ms.; *Dissertatio de Babrio* (1776), containing

some fables of Aesop, hitherto unedited, from a Bodleian ms.; the pseudo-Orphic *De lapidibus* (1781), which he assigned to the age of Constantius; *Conjecturae in Strabonem* (1783); Isaeus *De Meneclis hereditate,* editio princeps (1785); Aristotle's *Poetica,* his most important work, published after his death (1794). Special mention is due of his editions of Chaucer's *Canterbury Tales* (1775–78); and of *Poems, supposed to have been written at Bristol by Thomas Rowley and others in the Fifteenth Century* (1777–78), with an appendix to prove that the poems were all the work of Chatterton. In 1782 he published a *Vindication of the Appendix.* While clerk of the House of Commons he edited *Proceedings and Debates of the House of Commons,* 1620–21 from the original ms. in the library of Queens' college, Oxford, and Henry Elsynge's (1598–1654) *The Manner of holding Parliaments in England.*

TYTLER, ALEXANDER FRASER, Lord Woodhouselee (1747–1813), Scottish judge, was born at Edinburgh on Oct. 15, 1747, the son of William Tytler. He was called to the Edinburgh bar in 1770. His first work, a supplement to Lord Kames's *Dictionary of Decisions,* entitled *The Decisions of the Court of Session,* was published in 1778, and a continuation appeared in 1796. In 1780 he was appointed a professor of universal history at Edinburgh. His lectures appeared finally in 1801 as *Elements of General History.* In 1790 he was appointed judge-advocate of Scotland, and wrote a *Treatise on the Law of Courts-Martial.* In 1801 he was raised to the bench as Lord Woodhouselee. He died at Edinburgh on Jan. 5, 1813.

Besides the works already mentioned, he wrote *Life and Writings of Dr. John Gregory* (1788); *Essay on the Principles of Translation* (1790); a dissertation on *Final Causes,* prefixed to his edition of Derham's *Physico-Theology* (1799); a political pamphlet entitled *Ireland profiting by Example* (1799); an *Essay* on Laura and Petrarch (1801); and *Memoirs of the Life and Writings of Henry Home of Kames* (1807).

TYTONIDAE: *see* Barn-Owls.

TYUMEŃ, a town in the Uralsk Area of the Russian S.F.S.R., in 57° 15′ N., 65° 18′ E., on the Tura river, which is difficult for navigation owing to its shallowness, though dredging has somewhat improved it; it is usually ice-free from May 8 to Nov. 15. Pop. (1926) 50,161. The highway across the Urals passes through the town, and the railway links it with Sverdlovsk and Omsk. In 1580, Yermak wintered on the site and in the following year captured Isker or Sibir, the fort from which Siberia took its name; the fort of Tyumeń was established in 1585. Later it became the centre for the colonization of the Tura, Tavda, Tobol and Ob rivers, but was superseded by Chelyabinsk, which had a railway link earlier than Tyumeń. In 1893 the first dairy farm was begun near Tyumeń by the English wife of a Russian, and this led to the immediate and rapid development of that industry in western Siberia. It has the largest tanning and leather industry in Siberia, and has smelting works, saw-mills, match factories and steamer and boat building yards. Wool is dressed, and there are potteries. The koustar (peasant) industries include cooperage, the making of carts, furniture, sledges, horse-collars and wooden household utensils. The Tyumeń carpets, with bright floral and animal designs are famous; the former Samoyede vegetable dyes are being replaced by aniline. The ploughs of the Kamen volost are also noted.

TZETZES, JOHN, Byzantine poet and grammarian, flourished at Constantinople during the 12th century A.D. Tzetzes has been described as a perfect specimen of the Byzantine pedant. Excessively vain, he resented any attempt at rivalry, and violently attacked his fellow grammarians. Owing to want of books, he was obliged to trust to his memory; hence he is to be used with caution. But he was a learned man, and deserves gratitude for his efforts to keep up the study of ancient Greek literature. Of his numerous works the most important is the *Book of Histories,* usually called *Chiliades* ("thousands") from the arbitrary division by its first editor (N. Gerbel, 1546) into books each containing 1,000 lines (it actually consists of 12,674 lines in "political" verse). It is a collection of literary, historical, theological and antiquarian miscellanies, subsequently re-edited by the author with marginal notes. The *Chiliades* is based upon a collection of letters (107 in number) which are addressed partly to fictitious personages and partly to the great men and women of the writer's time. They contain a considerable amount of biographical details. He is the author of the *Iliaca,* an abridgment of and supplement to the *Iliad* in 1676 hexameters, and the Homeric *Allegories,* dedicated to the empress Irene, two didactic poems in which Homer and the Homeric theology are explained on euphemistic principles. Tzetzes also wrote commentaries on Greek authors, for instance, on the *Cassandra* or *Alexandra* of Lycophron (ed. C. G. Müller, 1811) in which his brother Isaac probably helped him. He is our earliest authority (*Chil.* 3, 88, 339–48) for the story of the beggary of Belisarius. Mention may also be made of a dramatic sketch in iambic verse in which he describes the wretched lot of the learned.

Editions:—*Chiliades: Corp. Poet. Graec.* (Lyons, 1612); ed. Kiessling (1826). *Iliaca:* ed. Lehrs & Dübner (Paris, 1868). *Allegories* in Matranga, *Anecdota Graeca,* vol. i. (1850); *Scholia to Lycophron,* ed. Müller (1811).

For the other works of Tzetzes *see* J. A. Fabricius, *Bibliotheca graeca* (ed. Harles), xi. 228, and C. Krumbacher, *Geschichte der byz. Lit.* (2nd ed., 1897); monograph by G. Hart, "De Tzetzarum nomine, vitis, scriptis," in Jahn's *Jahrbücher für classische Philologie* Supplementband xii. (Leipzig, 1881).

In the Semitic alphabet the letter Y (*vau*) was sixth in order, and represented a labial spirant (equivalent to English *v* or *w*). The Greeks used the letter to represent a vowel and placed it last in their aphabet following T (*tau*). In the place occupied by Y (*vau*) in the Semitic alphabet the n Greek alphabets had the letter digamma F, which they ɔ represent the bilabial spirant (modern English *w*), a sound ad fallen out of use in the eastern dialects. Greek forms of ter were Y, ϒ or V and the last of these passed from the dic alphabet into Latin. The form ϒ was identical in both ruscan and Lydian alphabets.

Latins, who at first used the combination FH to express ıvoiced labial spirant (English *f*), came under Etruscan ıce to represent this sound by F alone. Thus, this letter, in Greek had represented the bilabial spirant (English *w*), ɔ longer available, and *v* had to do duty for both the vowel

NAME OF FORM	APPROXIMATE DATE	FORM OF LETTER

CLASSICAL LATIN AND ONWARDS		U

DEVELOPMENT OF THE LETTER "U" FROM THE EARLIEST TIMES TO PRESENT DAY

ish *u*) and the bilabial spirant (English *w*). In later Latin e the separation of the Romance languages the bilabial passed he voiced spirant equivalent to English *v*. Meanwhile, while najuscule letter retained its form V, the minuscule and had a rounded form, e.g., u (uncial), u (cursive of the entury) and, later, Carolingian u. Thus the letter passed he mediaeval hands having the majuscule pointed form V he minuscule rounded form *u* and representing two sounds, owel (*u*) and the spirant (*v*). In the later middle ages a ntiation took place similar to that between the letters *i* and *j*. The majuscule form, being generally used initially, came to represent the consonant, which usually occurred initially, in all positions; while the rounded form was used exclusively for the vowel. As a result a minuscule *v* and a majuscule *U* were adapted for use when required. The differentiation was wise and useful, and reversed the process by which in the Latin alphabet the single symbol had done duty for both consonant and vowel.

In Attic Greek the sound represented by the letter was a high front rounded vowel (similar to French *u*, German *ü*). In Latin the vowel was a middle high rounded one (similar to the sound of *oo* in *shoot*). In modern English short *ŭ* has become in most positions a low middle vowel closely resembling the original sound of short *ă* (*e.g.*, in the words *but, dumb*). There are certain exceptions, however (cf. *bull, bush, put*). The long vowel has within the last two hundred years developed a palatal spirant (the sound of *y*) before it, except when it follows a liquid (*r* or *l*). Contrast the sound of the pure vowel in the word *brute* with that in the words *huge, rebuke*. This change is sufficiently recent for such words as begin with long *ū* (e.g., *University*) to be preceded, when the indefinite article is required, by the form *an*, not *a*, showing that the sound was a pure vowel sound. It is still so pronounced in certain cases in the United States of America. It is an interesting fact that this change was exactly paralleled in the Boeotian dialect of Greek. (B. F. C. A.)

UAKARI, the name of certain tropical American monkeys, distinguished by their short tails. They constitute the genus *Uacaria* and are confined to the forests of Amazonia. (*See* PRIMATES.)

UBANGI, a river of equatorial Africa (extreme length 1,400 m.), the chief northern affluent of the Congo (*q.v.*). The Ubangi (otherwise Mubangi or Mobangi) enters the Congo by various mouths between 0° 22′ and 0° 37′ S. and 17° 40′ and 17° 50′ E. The Ubangi is formed by the junction of the Bomu and the Uele (Welle), the latter rising a few miles from the western edge of the western rift-valley, north of Lake Albert and after a course of 700 m. it joins the Bomu at Yakoma. Both streams, which have hitherto received numerous affluents, flow westward as a wide river. A short distance below the junction of the Bomu and Uele, the Kota coming from the borders of Darfur, and forming the most northerly extension of the Congo basin enters the united stream (right). The remaining tributaries, mostly on the right bank are smaller. Below the confluence with the Kouma, which river offers water communication to within easy reach of the Shari basin, the Ubangi makes a great bend south and immediately it flows between hills and passes the Zongo or Grenfell rapids, which are a barrier to navigation save for small boats in flood season. Above Zongo rapids the river is navigable up to the confluence of the Uele and Bomu, and the former is navigable at high flood up to the Bomokandi confluence in 26° 8′.

The Uele was discovered from the north by G. A. Schweinfurth in 1870, who believed it to belong to the Chad system, but W. Junker, who (1882–1883) followed the river to near its confluence with the Bomu, showed that it belonged to the Congo system. In 1885 George Grenfell, ascended the Ubangi as far as the Zongo rapids. He was followed in 1886–1889 by the Belgian, A. van Gèle, who established the identity of the Ubangi with Schweinfurth's Uele. The Bomu was discovered from the north in 1877 by a Greek, P. Potagos, and its upper course was followed for some distance by Junker. The Ubangi and the Bomu form the frontier between Belgian Congo and French Congo, the northern banks of both streams belonging to France.

ÜBERWEG, FRIEDRICH (1826–1871), German historian of philosophy, was born on Jan. 22, 1826 at Leichlingen, in Rhenish Prussia, where his father was Lutheran pastor. Educated at Göttingen and Berlin, he qualified himself at Bonn as *Privatdozent* in philosophy (1852). In 1862 he was called to Königs-

berg as extraordinary professor, and in 1868 was advanced to the ordinary grade. He died on June 9, 1871. His compendious, accurate and impartial *History of Philosophy* has been repeatedly re-edited. At first he followed Beneke's empiricism, and opposed the subjectivistic tendency of the Kantian system, maintaining in particular the objectivity of space and time, which involved him in a somewhat violent controversy. His own system he preferred later to describe as an ideal realism, which refused to reduce reality to thought, but asserted a parallelism between the forms of existence and the forms of knowledge.

Überweg's works include *System der Logik* (1857; 5th ed., 1882; Eng. trans. of 3rd ed. by T. M. Lindsay, 1871); *Grundriss der Gesch. der Phil.* (1863–66, 12th ed. 1923–28); an essay (1861) on the authenticity and order of Plato's writings; *Schiller als. Hist. und Phil.* (published by Brasch from his papers, Leipzig, 1884). *See* F. A. Lange, *F. Ueberweg* (1871); M. Brasch, *Die Welt- und Lebensanschauung F. Ueberwegs* (Leipzig, 1889).

U-BOAT: *see* SUBMARINE CAMPAIGNS.

UCCELLO, PAOLO (1397–1475), Florentine painter. His name was Paolo di Dono, but he was commonly called Uccello from his love of painting birds. He was born in Florence, the son of a surgeon barber. When about ten years of age he was apprenticed to Lorenzo Ghiberti, who was then engaged on his first doors of the Florentine Baptistery. It is not known who was Paolo's master in painting, and only a small number of his works have survived. He went to Venice in 1425 and designed a mosaic of St. Peter for the façade of St. Mark's. On his return to Florence in 1433 he was employed in the cathedral; he painted the equestrian figure of Sir John Hawkwood, an English adventurer and soldier of reputation, who had died in the service of Florence in 1393. The painting, now hanging over the door of one of the aisles, was transferred from wall to canvas in 1842. It is a chiaroscuro in terra verde, the first equestrian picture of the Renaissance. In 1443 Paolo designed cartoons for the circular windows of the cupola. A year later he probably went to Padua, perhaps in the company of his friend Donatello. His paintings there of giants, in chiaroscuro, at the entrance of the Casa Vitaliani, were much admired by Mantegna. They are, unfortunately, no longer extant. Of the frescoes in the cloisters of S. Maria Novella, Florence, showing the stories of the Creation and the Deluge, only fragments remain. The series of three battlepieces, representing the Rout of San Romano, dispersed in the galleries of Florence, Paris and London, once formed part of the decoration of a large ground floor room, the bedchamber of Lorenzo the Magnificent, in the Medici (Riccardi) palace. The Louvre has a panel, much repainted, of the portraits of Giotto, Brunellesco, Donatello, Antonio Manetti and himself. Paolo's last work is said to have been a fresco painted over the door of the church of S. Tommaso in the Mercato Vecchio. This work apparently met with the disapproval of his friend, Donatello, and Paolo thereupon gave up painting and devoted himself to the study of perspective. He died on Dec. 10, 1475. He had a fine feeling for the decorative value of shapes and colour. He excelled in the representation of the picturesque armour and costumes of his time, and introduced birds, horses and animals of all kinds. He contributed much towards the development of the art of representing natural objects in three dimensional space.

UDAD, AOUDAD or **AUDAD,** the Barbary sheep, *Ovis lervia,* the only wild sheep found in Africa, where it inhabits all the mountain ranges of the north, descending eastward far into the Sudan. It is distinguished by the abundant hair on the throat and fore-quarters of the rams, the length of the tail, the absence of face-glands, and the goat-like structure of the horns.

UDAIPUR or **MEWAR,** an Indian state in the Rajputana agency. Area, 12,756 sq.m. Pop. (1921), 1,380,063. The greater part of the country is level plain. A section of the Aravalli Mountains extends over the south-western and southern portions, and is rich in minerals, but the mines have been long closed. The general inclination of the country is from south-west to north-east, the Banas and its numerous feeders flowing from the base of th Aravalli range. There are many lakes and tanks in the state, th finest of which is the Debar or Jaisamand, with an area of near 21 sq.m. The ancient coinage is of the Sassanian or Persian typ

The chief, whose title is maharana with a salute of 19 gun is the head of the Sisodia clan of Rajputs, and claims to be th direct representative of Rama, the mythical king of Ajodhya. H is universally recognized as the highest in rank of all the Rajpu princes. The dynasty offered a heroic resistance to the Mohamm dans, and boast that they never gave a daughter to a Mog emperor. They are said to have come from Gujarat and settle at Chitor in the 8th century. After the capture of Chitor b Akbar in 1568 the capital was removed to Udaipur by Maharan Udai Singh. During the 18th century the state suffered great from internal dissension and from the inroads of the Mahratta It came under British protection in 1817.

The name of *Mewar* is derived from the Meos, or Minas, a trib of mixed Rajput origin, who have likewise given their name to different tract in northern Rajputana, called Mewat, where the are now all Mohammedans. The Mewar Bhil Corps, raised as local battalion in 1840, which was conspicuously loyal during th Mutiny, was in 1897 attached to the Indian army.

The picturesque city of UDAIPUR is 2,469 ft. above sea-leve Pop. (1921), 34,789. It is situated in a valley amid wooded hill on the bank of a large lake (Pichola), with palaces built granite and marble. The maharana's palace, which crowns th ridge on which the city stands, dates originally from about 157 but has had additions made to it till it has become a conglomer tion of various architectural styles. On Lake Pichola are tw islands, on which are palaces dating respectively from the midd of the 17th and of the 18th centuries. In the neighbourhood a Eklingji (with a magnificent temple of the 15th century), an Nagda, the seat of the ancestors of the chiefs of Udaipur.

There is another UDAIPUR STATE in the Central Provinces (ti 1905 one of the Chota Nagpur states of Bengal). Its capital Dharmjaygarh.

UDAL, NICHOLAS (1504–1556), English schoolmaste translator and playwright, author of the earliest extant Englis comedy, *Roister Doister,* came of the family of Uvedale, who i the 14th century became lords of Wykeham, Hants, by marriag with the heiress of the Scures. He latinized the name as Udallu and thence anglicized it as Udal. He is described as Owdall the parish of St. Cross, Southampton, 12 years old at Christma 1516, when admitted a scholar of Winchester College in 151 (*Win. Schol. Reg.*). He was therefore 16½ years of age when a mitted a scholar of Corpus Christi college, Oxford, in June 152 he is called Wodall as a lecturer at that college in 1526 to 152 (T. Fowler, *Hist. C. C. C.*).

With John Leland he produced "dites" (ditties) "and inte ludes" (B.M. MS. 18A lxiv.) at Anne Boleyn's coronation on Ma 31, 1533. Leland's contributions are all in Latin; those "Udallus," which form the chief part, are mostly in English, th speeches being each spoken by a "child," at Cornhill beside Lea enhall "at the Conducte in Cornhill" and "at the little Conduc in Cheepe." From the dedication to his *Floures for Latine Spe ynge, selected and gathered out of Terence and the same tra lated into Englysshe,* published by Bartlet (*in aedibus Bertheleti* (1534), it is inferred that Udal was usher at St. Anthony's scho next door to Austin Friars, London. At midsummer 1534 he be came head master of Eton. At Eton Udal's salary was £10 and for livery, with "petty receipts" of 8s. 4d. for *obits,* 2s. 8d. f laundress, 2s. for candles for his chamber, and 23s. 4d. "for ink candles and other things given to the grammar school by Dr. Lup ton, provost."

There was a yearly play, 3s. being paid for the repair of th dresses of the players at Christmas, and 1s. 4d. to a servant the dean of Windsor for bringing his master's clothes for th players. A payment for repair of the players' dresses recurs ever year. Udal has been credited (E. K. Chambers, *Mediaeval Sta* ii. 144, 192) with producing a play at Braintree while vicar there recorded in the churchwardens' accounts for 1534 as "Placida *alias* Sir Eustace." The play is actually called in the account

xtant in 17th-century extracts) "Placy Dacy *alias* Sir cy," and is the old play of Placidas, mentioned in the 9th . Udal only became vicar of Braintree in 1537 but did not here at that time. He held the benefice until 1554. The s of Cromwell for 1538 include "Woodall, the schole- of Eton, to playing before my lord, £5." Presumably he a troupe of Eton boys with him. In that year he pub- second edition of his *Floures of Terence* for the benefit boys. The often-questioned account of Thomas Tusser *Hundred Pointes of Good Husbandrie*) is typical of Eton ime, as Udal's predecessor Cox is said in Ascham's *Schole-* to have been "the best scholemaster and greatest beater time":—

From Powles[1] I went to Aeton sent,
To learn straightwaies the Latin phraise;
Where fifty-three stripes given to me at once I had;
For fault but small or none at all
It came to pass thus beat I was;
See, Udall, see, the mercie of thee to mee, poor lad.

rule of the rod at Eton was short. He was brought up be- privy council on March 14, 1541 for being "counsail" with the boys, Thomas Cheney and Thomas Hoorde, for steal- er images and chapel ornaments. He denied the theft, nfessed to a much more scandalous offence with Cheney, s sent to the Marshalsea prison. He tried, but failed, to ored to Eton.

eems to have maintained himself by translating into Eng- 1542, Erasmus's *Apophthegms* and other works. In 1544 ished a new edition of the *Floures of Terence*. He seems taken a schoolmastership in Northumberland or Durham, nd in one of his *Encomia* speaks of him, probably at this s translated to the Brigantes. He purged himself, however, posing the *Answer to the Articles of the Commoners of hire and Cornwall* (Pocock, *Troubles of the Prayer Book* , Camd. Soc., new series, 37, 141, 193), when they rose in n in the summer of 1549 against the First Prayer Book of VI. In 1551 he received a patent for printing his transla- Peter Martyr's two works on the Eucharist and the Great n English (Pat. 4 Edw. VI. pt. 5, m. 5, Shakespeare Soc.). He was rewarded by being made a canon of Windsor on , 1551. On Jan. 5, 1552 he edited a translation of Eras- *Paraphrases* of the Gospels, himself translating the first while that on St. John was being translated by the princess till she fell sick and handed her work over to Dr. Malet. rk was done at the suggestion and expense of the dowager Katharine, in whose charge Mary was. A translation by f Geminus's *Anatomie* or *Compendiosa totius anatomiae tio*, was published in 1553. Udal's preface is dated July 2 "at Windesore." In June and September 1553 (*Trevel-* . Camd. Soc. 84, ii. 31, 33) "Mr. Nicholas Uvedale" was the rate of £13, 6s. 8d. a year as "scholemaster to Mr. Ed- ourtney, beinge within the Tower of London, by virtue of ng's Majesty's Warrant"—the young earl of Devon, who n in prison ever since he was twelve years old.

n Mary on Dec. 3, 1554 issued a warrant on Udal's be- recting "the maister and yeomen of the office of the " to deliver whatever Udal should think necessary for forth dialogues and interludes, while the exchequer was to provide the money to buy them (Loseley mss. Kempe *Hist. mss. Com. Rep.* vii. 612). One of these interludes bably *Roister Doister;* for it was in January 1553, *i.e.*, hat Thomas Wilson, master of St. Katharine's Hospital Tower, produced the third edition of *The Rule of Reason,* t text-book on logic written in English, which contains, he two earlier editions, published in 1551 and 1552 respec- do not contain, a long quotation from *Roister Doister* out of an interlude made by Nicholas Udal." The play was at Stationers' Hall, when printed in 1566. Only one copy n, which was given to Eton by an old Etonian, the Rev. iggs, in 1818, who privately printed thirty copies of it. are strong reasons for believing that *Roister Doister* first ed in 1553, and therefore could not have been written at er was a chorister of St. Paul's.

Eton or for Eton boys.

Nor could it have been written at Westminster school or for Westminster boys, as argued by Professor Hales in *Eng. Studien* (1893) xviii. 408. For though Udal did become head master of Westminster, he only became so on Dec. 16, 1555, nearly two years after Wilson's quotation from *Roister Doister* appeared. He was at Winchester in the interval, perhaps as master of the old City Grammar or High School. When the monks re-entered Westminster, on Mary's restoration of the abbey (Nov. 21, 1556), the school did not, as commonly alleged, cease, nor had Udal ceased to be master (Shakespeare Soc. iii. xxxiv.) when he died a month later. He was buried on Dec. 23, 1556.

Roister Doister well deserves its fame as the first English comedy. It is infinitely superior to any of its predecessors in form and substance. It has sometimes been described as a mere adaptation of Plautus's *Miles Gloriosus*. Though the central idea of the play—that of a braggart soldier (with an impecunious parasite to flatter him) who thinks every woman he sees falls in love with him and is finally shown to be an arrant coward—is undoubtedly taken from Plautus, yet the plot and incidents, and above all the dialogue, are absolutely original, and infinitely superior to those of Plautus.

The play was printed by F. Marshall in 1821; in Thomas White's *Old English Dramas* (3 vols., 1830); by the Shakespeare Society, vol. iii., the introduction to which contains the fullest and most accurate account of his life; in Edward Arber's reprints in 1869; and Dodsley's *Old Plays* (1894), vol. iii. A. R. Moon (Times Lit. Supp. Ap. 19, 1928) suggests the ascription to Udal of a lost play *Ezechias* acted at King's College, Cambridge, before Queen Elizabeth, on Aug. 8, 1564, eight years after Udal's death. He identifies this piece with the *Tragoedia de papatu* referred to by Gale (*Scriptores Britanniae*) as Udal's work.

UDAL, a kind of right still existing in Orkney and Shetland, and supposed to be a relic of the old allodial mode of landholding existing antecedently to the growth of feudalism in Scotland (*see* ALLODIUM). The udal tenant holds without charter by uninterrupted possession on payment to the Crown, the kirk, or a grantee from the Crown of a tribute called scat, or without such payment, the latter right being more strictly the udal right. Udal lands are convertible into feus at the option of the udallers.

UDINE, a town and archiepiscopal see of Venetia, Italy, capital of the province of Udine, situated between the Gulf of Venice and the Alps, 84 m. by rail N.E. of Venice, 450 ft. above sea-level. Pop. (1921) 55,671 (town); 56,041 (commune). The interesting Porta Aquileia (14th cent.) is almost all that is left of the old city walls. Some of the streets are arcaded and there are some fine palaces. The old castle on a hillock in the centre of the town, at one time the residence of the patriarchs of Aquileia, and now used as a museum and picture gallery, was erected by Giovanni Fontana in 1517 in place of the older one destroyed by an earthquake in 1511. The Romanesque cathedral contains some interesting examples of native art by Giovanni Martini da Udine, a pupil of Raphael, and others. The church of S. Maria della Purità has frescoes by Giovanni Battista and Domenico Tiepolo. In the picturesque principal square stands the town hall, built in 1448–1456 in the Venetian-Gothic style, and skilfully restored after a fire in 1876; opposite is a clock tower resembling that of the Piazza di San Marco at Venice with the elegant loggia of S. Giovanni leading to the church of the same name (1533). In the square is a statue of Peace, erected in commemoration of the peace of Campo Formio (1796), which lies 5 m. to the W.S.W. and two columns, one with the tier of S. Mark, the other with a statue of Justice. The archiepiscopal palace contains frescoes by G. B. Tiepolo. The leading industry of Udine is silk-spinning, but it also possesses manufactures of linen, cotton, hats and paper, tanneries and sugar refineries, and has a considerable trade in flax, hemp, etc. Branch railways lead to Cividale del Friuli and S. Giorgio di Nogaro.

Udine lay on the line of the Via Iulia Augusta, and there is proof of its existence in Roman times. In 983 it was given by the emperor Otto II. to the patriarch of Aquileia, to whom it may have belonged even earlier. In 1222 or 1238 the patriarch Berthold made it the capital of Friuli, and in 1420 it became Venetian. In 1752 it became an archbishopric. It was the seat of the Italian

Comando Supremo (G.H.Q.) during the World War from 1915 to 1917.

UFA, the chief town of the Bashkir A.S.S.R., situated at the confluence of the Ufa river and the Byelaya, in 54° 44′ N., 56° E., at the western edge of the Ural forests. Pop. (1926) 96,423. Its industries include copper-smelting, saw-milling, flour-milling, rope-making, brewing and fruit-liqueur distilling. After the fall of Kazan, which destroyed the centre of unity of the non-Russian elements in the district, the Russians advanced through the Finnic-Bashkirian state and founded Ufa in 1574.

UGANDA, a British protectorate in Eastern Equatorial Africa, lying between Lake Victoria and Lakes Albert and Edward, and between the Mountain Nile and Lake Rudolf. The same name was originally applied to the Bantu kingdom of Buganda, which is one of the provinces of the protectorate, and is now styled officially by the correct native name of "Buganda." The Swahili followers of the first explorers always pronounced the territorial prefix, Bu, as a simple vowel, U; hence the incorrect rendering "Uganda." It was first applied to the kingdom on the north-west shores of Lake Victoria discovered by J. H. Speke in 1862, and in time came to include the large protectorate which grew out of the extension of British influence over Buganda.

Frontiers and Area.—The area of the protectorate has varied considerably since Buganda was placed under British protection in 1894. From that date up to 1901 various regions were added. Its then eastern province, which included the northern half of the eastern shores of Lake Victoria, was transferred in 1903 to the East Africa Protectorate (now Kenya Colony). The northern frontier is, roughly, about the line of 4° N. and is conterminous with the Anglo-Egyptian Sudan. On the Nile itself the frontier was at Lado (a little north of 5° N.). By agreement, made in 1914, the frontier on the river was drawn back to Nimule, while the Sudan surrendered to Uganda approximately 4,000 sq.m. W. of the Nile which had been part of the Lado enclave. On the south the protectorate includes part of Lake Victoria, and west of the lake the frontier, for the most part, is the 1st degree of S. lat. This frontier coincided with the northern frontier of German East Africa. On the west, where German, British and Congo Free State territories met, the Uganda frontier was to begin along the 30th meridian of east longitude. In 1904 it was found, however, that the 30th meridian had been placed some 25 m. W. of its true position on the maps used when the frontier was agreed upon, and the adjustment of claims caused by this "wandering meridian" gave much trouble. As finally settled in 1912 the Uganda-Belgian Congo frontier is drawn so as to include Kizegi, a highland region containing some of the peaks of the Mfumbiro volcanoes, in Uganda, and to put most of Lake Edward in Belgian territory. From that lake the frontier goes across the Ruwenzori range and along the Semliki river to Lake Albert, the western half of which, nearly to the north end, fell to the Belgian Congo. Thence the frontier follows the Congo-Nile watershed. In 1922 further frontier changes were made. The Didinga district east of the Nile was taken over by the Sudan, while in 1926 Kenya Colony took over administration of the Rudolf province. These arrangements relieved Uganda of responsibility for remote, unsettled, semi-arid regions where Abyssinians, Somali and Turkana carried on gun-running and raided peaceful tribes. The area of Uganda protectorate, allowing for the changes stated, is approximately 94,000 sq.m. (including 15,000 sq.m. of water). The division into provinces is (1) Buganda, (2) Eastern (originally Central), (3) Western, (4) Northern (originally Nile). The following description includes in part the former Rudolf province.

Physical Features.—The protectorate, with a singularly diversified surface of lofty plateaux, snow-capped mountains, vast swamps, dense forests and regions of desolate aridity (valley of Lake Rudolf) offers a remarkable variety of climates. The Eastern province is abundantly watered near Victoria Nyanza and around Mt. Elgon and the noble Debasien mountain (about 50 in. to 100 in. annually); elsewhere in Karamojo and the northern regions, the rainfall lessens to about 20 inches. Busoga and the western part of the Elgon district have a regular West African climate—hot, moist and not over-healthy. These are the conditions of Buganda, a country with an annual rainfall of from 60 to 80 in., a regular West African climate, and severe and frequent thunderstorms. Much the same may be said about the Western province, except for the cooling influence of the Ruwenzori snow range, which pleasantly affects Toro and northern Ankole. The rainfall on Ruwenzori and the central Semliki valley is quite 100 in. per annum. Along the Ruwenzori range are glaciers and snowfields nearly 15 m. in continuous length and some 5 m. in breadth. The Northern province is, perhaps, the hottest part of Uganda. Like the districts round Lake Rudolf, the average altitude (near the Nile) is not more than 2,000 ft., but the rainfall is more abundant, being an average of 30 in. per annum.

Mt. Elgon (*q.v.*), a vast crater, the rim of which rises to over 14,000 ft., and its surrounding heights form a mountain country notable for innumerable cascades and dense forests. Elgon dominates a large area and can be seen from the north-east coast of Victoria Nyanza, from near the main Nile stream, from the heights overlooking Lake Rudolf and from Kikuyu escarpment. The Eastern province consists of well-forested, undulating land (Busoga) on the coast of the lake, a vast extent of marsh round the lake-like backwaters of the Victoria Nile (Lakes Kioga or Ibrahim, Kwania, etc), and a more stony, open, grain growing country (Bukedi, Lobor, Karamojo). The Turkana country west of Lake Rudolf is now arid, and most of the rivers have ceased to show running water in their lower courses. A good deal of high land—rising in some peaks to near 10,000 ft.—is found in the eastern part of the Northern province, and these heights attract moisture and nourish permanent streams flowing Nilewards. But much of the lower ground is stony and poor in vegetation, while the low land near the main Nile is exceedingly marshy.

The Ripon falls in the centre of the northern coast of the Victoria Nyanza, at the head of the exquisitely beautiful Napoleon gulf, mark the exit of the fully born Nile from the great lake. The Victoria Nile tumbles over 50 m. of cascades and rapids (descending some 700 ft. in that distance) between Ripon falls and Kakoge. Here it broadens into Lake Kioga (Ibrahim), in reality a vast backwater of the Nile, and continues navigable (save for sudd obstacles at times) through Lake Kioga and then northwards for 100 m. to Foweira and Karuma falls. Between Karuma and Murchison falls the Victoria Nile is unnavigable. At Fajao the navigation can be resumed into Lake Albert. The main Nile stream, when it quits Lake Albert, continues navigable as far north as Nimule (3° 40′ N.). Navigability begins again 100 m. lower down at Rejaf, from which point steamers ply to Khartoum (*see* NILE).

The topography of the Western province includes the eastern part of Lake Edward, Lake George, the eastern and northern shores of Albert Nyanza (*q.v.*), part of the great snowy range of Ruwenzori (*q.v.*), the dense Semliki, Budonga, Mpanga and Bunyaraguru forests, the salt lakes and salt springs of Bunyoro and western Toro, the innumerable and singularly beautiful crater lakes of Toro and Ankole, part of the volcanic region of Mfumbiro (*q.v.*) and the healthy plateaux of Ankole. The water of Lake Victoria is perfectly fresh. In Lakes Albert and Edward the water ranges from salt to slightly brackish.

Geology.—Although a good deal of geological work has been done, much more remains to be done. What may be called the foundation formation, consisting of Archaean rocks—gneiss, schist and granite—covers large areas through which the Nile cuts its way in alternate narrow gorges and open reaches. In Ankole and Koki rocks consisting of granular quartzite, schistose sandstone, red and brown sandstone, and shales with cleaved killas rest on the Archaean platform. Clay rocks of very varying texture and appearance occur over a wide area in Buganda, the western province, and the south part of the northern province. The Nile, at the Ripon falls, leaps over a basalt dike. The rocks on the verge of the Kisumu province of Kenya Colony are mainly volcanic (basalt, tuff, lava, kenyte). Thick beds of crystalline limestone occur in the Eastern province, with sandstone in Musoga, basalt round Mt. Elgon, slate (Busoga) and iron stone (Busoga and Bukedi). In the Rudolf province there are the basalt, lava, tuff and kenyte of the volcanic Rift valley, overlying a formation of gra-

neiss, and quartz. Gneiss, granite and quartz—the decom- granite giving the red "African" clay—are the leading fea- in the formation of the Northern province, of Buganda, and Western province, with some sandstone in the littoral dis- of Buganda and in Ankole, and eruptive rocks and lava th-western Ankole and on the eastern flanks of Ruwenzori. te is a surface deposit of wide occurrence, and iron ore atite) is abundant. Deposits of Karroo age have been at Entebbe and elsewhere. It may be added that there is ant evidence of man's presence in Uganda in the Palaeolithic eolithic ages.

ra.—The vegetation is luxuriant, except in the Rudolf re- which has the sparse flora of Somaliland. In the Western ce, Busoga and the Elgon district, the flora is very West n in character. The swampy regions of the Nile and of astern province are characterized by an extravagant growth yrus and other rushes, of reeds and coarse grass. There are ant tropical forests in the coast region of Buganda, in Bu- west Elgon, western Unyoro, eastern Toro, the central Sem- lley and north-west Ankole. The upper regions of Mt. El- Mt. Debasien and Mt. Agoro are clothed with forests of rs—juniper and yew—and witch hazels (*Trichocladus*). are also giant yew-trees (*Podocarpus*) on the flanks of nzori and the Mfumbiro volcanoes between 7,000 and 9,000 ut no junipers. The alpine vegetation on all these lofty tains is of a mixed Cape and Abyssinian character—witch , senecios, lobelias, kniphofias, everlasting flowers, tree s and hypericums. The really tropical vegetation of Buganda rly identical with that of West Africa.

una.—The fauna also has many West African affinities in ot, forested regions. In the adjoining Kisumu province of a Colony there are several West African mammals, such as road-horned tragelaph and the forest pig. These are also in part of the Semliki forests. As a rule, however, the of the Upper Semliki valley, of parts of Ankole, Buganda unyoro, of the Northern, Rudolf and Eastern provinces, is at "East African," "Ethiopic" character which is specially ature of South and East Africa and of the Sudan right across Abyssinia to the river Senegal. Among notable mammals impanzee is found in Bunyoro, Toro and north-west Ankole, as only recently become extinct in Buganda; the gorilla is in the Mfumbiro region; the okapi inhabits the Semliki s on the Congo frontier; the giraffe (the male sometimes ping five horn cores) is common in the Northern, Eastern udolf provinces; there are three types of buffalo—the Cape, ongo and the Abyssinian; two species of zebra—one of them 's—the African wild ass, the square-lipped ("white") and d-lipped ("black") rhinoceroses, the elephant—in 1928 it stimated that there were 20,000 elephants in the protectorate popotamus, water tragelaph ("Speke's antelope"), Cape ant- aard-wolf (*Proteles*), hunting-dog, and nearly every genus ost of the species of African antelopes. The birds are more African than the mammals, and include the grey parrot, all nera of the splendidly-coloured turacoes, the unique "whale- d stork" and the ostrich.

habitants.—Europeans in 1927 numbered 1,752, of whom ere females. There are some traders and planters, but most e whites are officials or missionaries. (The white pop. in had been 507.) Asiatics, some 3,000 in 1909, numbered 3 in 1927. Most of them are British Indians. The African n 1927 was estimated at 3,149,000. The races indigenous protectorate are mainly of the negro species (with slight sian intermixture), and may be divided into the following ories: (1) *Pygmy prognathous* (so-called "Congo" pygmies Semliki forest, of Kiagwe in Buganda and of the western of Mt. Elgon, and the types of Forest negroes); (2) *Bantu s* (Banyoro, Bairu, Basese, Basoga, Bakonjo, Baganda, ba and Kavirondo); (3) *Nile negroes* (Aluru, Bari, Madi, i, Gang, Lango, Latuka, Tesi, Sabei [Nandi], Turkana and nojo); (4) *Hamitic* (the remarkable "Hima" or "Huma" cracy in Bunyoro, Buganda, Toro and Ankole). The pygmies nerally known as Bambute or Bakwa in the Semliki forests. They are reddish-yellow and brownish-black (according to individual variation) in skin colour, with head hair often tending to russet, and body hair of two kinds—black and bristly on the upper lip, chin, chest, axillae and pubes; and yellowish and fleecy on the cheeks, back and limbs. Their faces are remarkable for the long upper lip and the depressed broad nose with enormous alae. Associated with these pygmies is the "Forest negro" type (Lendu, Lega, Baamba, Banande), of normal human stature, but short-legged and unusually prognathous. The Bantu negroes include the remarkable Baganda people. These last, before the arrival of Arabs and Europeans, displayed a nearer approach to civilization than has as yet been attained by an unaided negro people. Their dynasty of monarchs can be traced back with tolerable certainty to a period coincident with the reign of Henry IV. of England (A.D. 1400). The first Buganda king was probably a Hamite of the Hima stock (from Bunyoro). Until the coming of the white man the Baganda and most of the other Bantu peoples of the protectorate worshipped ancestral and nature spirits, who had become elevated to the rank of gods and goddesses. The Baganda are now mainly Christian. A "totem" system is still in vogue. All the Baganda belong to one or other of 29 clans, or "Bika," which are named after and have as totem familiar beasts, birds, fish or vegetables. The Baganda are not sexually a very moral people, but they have an extreme regard for decency, and are always scrupulously clothed (formerly in bark cloth, now in calico). As a general rule all the Bantu tribes in the western half of the protectorate, including the Basoga, are careful to consider decency in their clothing, while the Nilotic negroes are, or until recently were, often completely nude in both sexes. More or less nudity among men is characteristic even of the Bahima (Hamites). But in this caste the women are scrupulously clothed.

The Nile negroes and Hima are tall people. The Bahima are often markedly handsome, even to European eyes. In the Bahima the proportion of Caucasian blood is about one-fourth; in the Nile negroes and Bantu from one-sixteenth to none at all. The aboriginal stock of the Uganda Protectorate is undoubtedly the pygmy-prognathous, which has gradually been absorbed, overlaid or exterminated by better developed specimens of the negro subspecies, or by Negro-Caucasian hybrids from the north and north-east.

The languages spoken in the Uganda Protectorate belong to the following stocks: (1) *Hamitic* (Murle and Rendile of Lake Rudolf); (2) *Masai* (Bari, Elgumi, Turkana, Sūk, etc.); (2*a*) Sabei on the northern slopes of Elgon and on Mt. Debasien; (2*b*) *Nilotic* (Acholi, Aluru, Gang, etc.); (3) *Madi* (spoken on the Nile between Aluru and Bari, really of West African affinities); (4) Bantu (Lu-ganda, Runyoro, Lu-konjo, Kuamba, Lihuku, the Masaba languages of west Elgon and Kavirondo, etc.); and lastly, the unclassified, isolated Lendu and Mbuba spoken by some of the pygmy-prognathous peoples. Among the Baganda a knowledge of English is common, and Kiswahili is used by the trading classes.

Agriculture and Trade.—Over 2,500,000 ac., or fully 75% of the land under cultivation, is devoted to food crops. In Buganda plantains are the staple food: sweet potatoes are grown all over the protectorate; millet is of chief importance to the Nilotic tribes; cassava, peas and beans are other common food crops. The natives also possess large herds of cattle—mostly humped, short-horned breeds—and flocks of sheep, all of the flat-tailed species, and goats. This live stock gives rise to a large trade in hides and skins. Of crops for export cotton holds a pre-eminent place; it is an industry entirely in the hands of the natives. Next in importance comes coffee, grown mostly on European-owned plantations. Formerly there was a fair trade in "wild" rubber; that died out about 1912, but plantation (Para) rubber exports began to be of value by 1918. Maize, ground nuts, simsim, chillies, tea and tobacco are among the minor crops. Cotton is grown by a multitude of small cultivators from seed supplied by the Government, experiments favouring a "Nyasaland Upland" variety. The swampy lands of the Eastern province are particularly suitable for the crop. The cotton is ginned at a large number of small ginneries instead of, as in the Sudan and elsewhere, by a few large ginneries. Cotton exports began modestly in 1904–05 with the despatch of

180 lb. worth £236. By 1910 the value of cotton exported had grown to £60,000; in 1918–19 it was £965,000. A "boom" followed and in 1924 the cotton exported was 196,000 bales and fetched £3,486,000. Thereafter there was some decline, due mainly to adverse weather conditions and the fall in world prices, and aggravated probably by the system of small and expensive ginneries. Exports of cotton fell in value to £3,051,000 in 1926, and in 1927, when a larger area suffered from drought and the crop failed, to £1,690,000. The crop of 1928 was about 120,000 bales.

In 1901–02, when trade returns were first compiled, the value of exports was about £50,000—the chief articles being rubber, ivory, skins and hides. These, with some transit trade from Belgian Congo, continued the chief commodities up to 1908–09, when the exports were valued at over £150,000. From 1910–11 cotton became the leading export, while coffee first figured to a noticeable extent during the World War. Imports are of a very miscellaneous character, cotton goods being the largest single item. Inevitably, during the process of development, imports exceeded exports in value. Between 1904 and 1917 imports increased from £190,000 to £1,296,000. In the same period exports increased from £60,000 to £1,076,000. In 1917 a customs union was entered into with the East Africa Protectorate (Kenya Colony). Separate statistics for imports have not since been available, but it was soon obvious that exports exceeded imports in value. Exports had risen to £2,393,000 in 1923, and were valued at £5,096,000 in 1925. The great effect of decreased cotton output and lower prices was seen in the export figures for 1926 (£3,597,000), and 1927 (£2,310,000). But the industry was too firmly established to be more than temporarily shaken. The cotton is sent mainly to England, India and Japan.

The mineral resources of the protectorate are but little known or developed. Since 1926 tin has been mined in the Kagera area, and it is also worked in Ankole; copper has been found in the Ruwenzori region, and mineral oils in the neighbourhood of Lake Albert. Tin first figured in the exports in 1927, when the ore exported was worth £20,000.

Towns and Communications.—The administrative capital is Entebbe (*a throne*) on a peninsula projecting into Victoria Nyanza in 0° 4′ N., 32° 27′ E. Some 20 m. N. by E. of Entebbe is Kampala (or Mengo), the capital of Buganda. Strictly, Kampala is the name of one of seven steep hills on which the town (pop. about 60,000) is built. The European quarters, fort, Government offices and Indian bazaar are on Nakasero hill; on Namirembe hill is the Anglican cathedral of St. Paul, replacing the church destroyed by lightning in 1910; on another hill (Rubaga) are the mission and cathedral of the Roman Catholics; on Mengo hill are the town residence of the kabaka of Buganda and the buildings of the *lukiko* (the Baganda parliament). On Kampala hill is the museum, and on Kasubi hill the tomb of Mtesa. The port of Kampala is Port Bell, 7 m. distant, a railway joining the two places. Of other towns the chief is Jinja, by the Ripon falls, a busy cotton and transport centre.

The protectorate is well provided with roads, which have the deserved reputation of being the best in East Africa. Access to the outer world was provided, in 1902, on the completion of the railway from Mombasa to Kisumu, on the Victoria Nyanza, and by the provision of steamers on the lake. This sufficed until the great development of the cotton trade after the World War. Meanwhile, a railway, 61 m. long, had been built (1912) through Busoga by the eastern side of an unnavigable stretch of the Nile from Jinja to Namasagali. To avoid the need to transport goods across Victoria Nyanza a railway (320 m. long, begun in 1921 and completed in 1928) was built from Nakuru, on the Mombasa-Kisumu line to a point on the Busoga railway. This new railway —165 m. of which are in Uganda—became the main line. It passes through a great cotton belt, and its usefulness was increased in 1929 by the building of a railway from Jinja to Kampala (about 60 miles). By this route Uganda is in direct railway communication with the Indian ocean. The distance between Kampala and Mombasa is 896 miles. There are steamer services (besides the boats on Lake Victoria) on the Victoria Nile, Lake Kioga, and Lake Albert and on the Mountain Nile to Nimule. F 1920 onwards efforts were made to connect the Sudan and Ug by air routes, and there are aerodromes at Nimule and J Motor traffic was first introduced in 1908.

Administration and Revenue.—The protectorate is adm tered on Crown Colony lines. The governor is assisted by executive and (since 1921) by a legislative council, on which nominated unofficial members. At the head of each province commissioner. The native States have a large measure of h rule. Of these Buganda is the chief and relations with it settled by treaty in 1900. The kabaka (king) is assisted ministry and by a *lukiko* or parliament. Similar arrangem have been made with the States of Bunyoro, Ankole and T while in regions where no well-defined native State existed, ministrations under recognized chiefs have been built up wher possible. Revenue is derived from poll taxes, customs duties export-cotton tax, trading licences and land rents. The chief is the poll tax. Since 1915–16 the protectorate has been supporting. The figures for 1926 were: revenue, £1,389,000; penditure, £1,295,000. In 1927 revenue dropped to £1,292 and expenditure was £1,430,000, the balance being made from accumulated surpluses. With growing revenue the adm tration devoted large sums to education, which up to 1925 been mainly in the hands of missionaries, and to public health. the education of the natives a system was developed from vil school to public school.

HISTORY

The countries grouped under this protectorate were invade some relatively remote period—say, three to four thousand y ago—by Hamitic races from the north-east, who mingled ex sively with the Nile negroes first, and then with the aborig inhabitants of Buganda, Bunyoro and Nandi. These Ham brought with them a measure of Egyptian civilization, cattle the arts of metallurgy, pottery and other adjuncts to neoli civilization. There was probably no direct intercourse with Eg by way of the Nile, owing to the lake-like marshes between and Fashoda, but instead an overland traffic with Ethiopia land of Punt) via Mt. Elgon and the Rudolf regions. In even this intercourse with the non-negro world died away, powerful kingdoms with an aristocracy of Galla descent grew in Buganda, Bunyoro, Busoga and Ankole.

The kingdom of Buganda especially dominated the land Victoria Nyanza in the 19th century. King Suna of Buganda heard of the outer world of white men in 1850 from a runa Baluch soldier of Zanzibar. Speke in 1862 reached Buga the first of all Europeans to enter that country. In the e 'seventies Sir Samuel Baker extended the rule of the Egyp Sudan as far south as the Victoria Nile. General Gordon, succeeded Baker, attempted through Colonel Charles Cha Long, in 1874, not only to annex Bunyoro but also Buganda to Egyptian dominions. But owing to the indirect influence of British government, exercised through Sir John Kirk at Zanzi the Egyptian dominions were prevented from coming south of Victoria Nile.

First Christian Missions.—Suna, the powerful king or peror of Buganda, who was the first to hear of a world bey Negroland, had been succeeded in 1857 by his still more brated son, Mtesa or Mutesa (*Mutesa* means the measur Mutesa had received Speke in a most friendly manner. In he received an epoch-making visit from H. M. Stanley. Stan in response to Mutesa's questions about religion, obtained f that king an invitation to Anglican missionaries, which he tr mitted to London through the *Daily Telegraph*. The letter entrusted to Linant de Bellefonds, a Frenchman in the Egyp service, who had been sent to Buganda by Gordon. On his re Bellefonds was murdered by the Bari. When his body was covered Stanley's letter was found concealed in one of his b and was forwarded to England.

Meanwhile the Zanzibar Arabs had reached Buganda in e increasing numbers as traders; but many of them were ear propagandists of Islam, and strove hard (with some success convert to that religion the king and chiefs of Buganda

ing countries. In 1877 the Rev. C. T. Wilson, one of a party ssionaries sent in answer to Stanley's appeal, arrived in a, and towards the end of 1878 was joined by Alexander y. In 1879 another party arrived by the Nile route. In me year the French Roman Catholic mission of the White s of Algeria was inaugurated, and thus from 1879 dates angular rivalry of the creeds of Anglican and Roman Chris- and of Islam.

882 Islam gained an ascendancy, and the French withdrew time. In the autumn of 1884 Mutesa died. A great change en wrought in Uganda during the latter years of his reign. fire-arms and swords had replaced the primitive bark-cloth ear, while under the teaching of the missionary-engineer y the native artisans had learnt to repair arms and use ean tools. Mutesa was a clever man of restless energy, but less of human life and suffering, and consumed by vanity. s succeeded by his son Mwanga, a cruel, weak and vicious then about 18. The intrigues of the Arabs led him to suspect signs of the missionaries. He became alarmed at their in- e over numbers of his people and resolved to stamp out ianity. The identification of the missionaries with political sies and their letters of introduction from secular authori- dded to Mwanga's fears and early in 1885 he determined to Christians and Muslims alike. Mackay and the Rev. R. P. were seized and their followers persecuted. Then in the au- of that year Bishop Hannington, unwisely, approached nda by Busoga, *i.e.*, from the east—the route by which tradition held that the conquerors of Buganda would come. wanga's orders Hannington was murdered (Oct. 1885). In 1886 there began a renewed and more terrible persecution ristians. Converts were butchered wholesale; on one oc- 32 were burnt at the stake together. The Baganda Chris- showed great heroism and the persecution but increased the er of converts. In 1888 a scheme of Mwanga's to entice all hristian and Muslim converts on to an island in the lake and them there to starve miscarried. Mwanga then fled and a time made his way to a French mission station at the end of Victoria Nyanza. In his absence his eldest brother va was made king and the principal offices were divided the three parties—the Ba-Ingleza ("English" Protestants), a-Fransa ("French" Roman Catholics) and the Ba-Islamu lims). But the Muslims, under Arab instigation, treacher- attacked and murdered many of the Christian chiefs and hristians fled to Ankole. For a time the Arabs were in the dant and as Kikewa refused to be circumcised he was de- d. His brother Karema was made king and large numbers peasantry were forced to submit to the hated circumcision. e "French" and "English" factions even in these straits could void quarrelling. They asked Mwanga to come back on con- s which he accepted, and he was brought across the lake by ler named Stokes (formerly a mission-agent) whose main eems to have been to secure ivory. Mwanga's attempt to re- re Mengo was unsuccessful and he took refuge in an island e lake. The Christians now asked the missionaries to return ep the peace between them and among those who came was Lourdel, who gained much ascendency over Mwanga. The tians defeated the Muslims in Oct. 1889, most of the Arabs the Baganda being killed. The Muslims however rallied, l a victory in November, but were finally beaten in Feb. Before this decisive victory Mwanga had appealed for help caravan then near the lake, led by Frederick John Jackson, had been sent by the newly formed Imperial British East a Company (the I.B.E.A.) to extend British influence (Kenya Colony). Jackson had instructions not to go to da. While he was absent from his camp Karl Peters, at the of a so-called German Emin Pasha Relief Expedition, ar- He read Jackson's correspondence and hastened on to nda. There with the help of Père Lourdel—who in Dec. 1889 wanga's name had offered to accept the British flag—Peters uded a treaty with Mwanga. Jackson hearing of Peters's do- followed him up to Mengo—but Peters had hurriedly de- d to the south end of the lake. Jackson was in a difficulty; finally he decided to take back to the coast an envoy from each faction. The day before he left Père Lourdel died.

Lugard's Work.—All these local intrigues were rendered useless by the Anglo-German agreement of July 1890 which placed Uganda in the British sphere of influence. Thereupon the I.B.E.A. company, in Oct. 1890, instructed Capt. F. D. Lugard (afterwards Lord Lugard), then at Kikuya, half way between the coast and the lake, to go to Uganda. Marching with unprecedented rapidity, Lugard entered Mengo on Dec. 18 with a force of 50 Sudanese soldiers and some 250 armed carriers. Lugard, by introducing the names "Protestant" and "Catholic"—till then unknown—and by insisting that all religion was free, endeavoured to dissociate it from politics. This attitude was welcome to neither faction, and for some days the position of the new arrivals on the little knoll of Kampala was very precarious. Lugard's first object was to obtain a treaty which would give him a right to intervene in the internal affairs of the country and after some critical episodes such a treaty was signed on Dec. 26. Lugard's position was strengthened by the arrival in Jan. 1891 of Captain W. H. Williams, R.A., with a small force of Sudanese and a maxim gun. Seeing however that the situation in Buganda was impossible unless they had a strong central force, which the I.B.E.A. company could not provide, Lugard and Williams formed the idea of enlisting the Sudanese who had been left by Emin and Stanley at the south end of the Albert Lake. Passing through Ankole and Bunyoro, along the northern slopes of Ruwenzori, Lugard reached Kavali at the south end of Lake Albert. He brought away with him 8,000 Sudanese men, women, children and slaves, under Selim Bey (an Egyptian officer). Some of these he left at posts he established along the southern border of Bunyoro. After an absence of six months from Buganda, Lugard reached the capital at the end of the year (1891) with 200 or 300 Sudanese soldiers and two or three times that number of followers. Meanwhile Williams, amid endless difficulties, with a mere handful of men, had managed to keep the two factions from civil war.

Not long after Lugard's return lawlessness again broke out and several murders were committed. In spite of strenuous efforts on Lugard's part to avert war the French party early in 1892 attacked the English, who had assembled round Kampala. The king and French party were defeated and fled to the Sese islands. The king and chiefs (except two ringleaders) being offered reinstatement, they appeared anxious to accept Lugard's terms, but the French bishop joined them in the islands, and from that day all hopes of peace vanished. Fighting was recommenced by a "French" attack on "English" canoes, and Williams thereupon attacked the island and routed the hostile faction. After this the "French" slowly concentrated in Buddu in the south, the Protestants migrating thence. Mwanga who was eager to accept Lugard's offers of reinstatement, succeeded in escaping from the custody of his own party and arrived in Mengo on March 30 (1892). A new treaty was made, and the British flag flew over the capital, while the French party were given a proportion of chiefships and assigned the province of Buddu. These were liberal conditions; while later, to close a controversy with France, the British government paid £10,000 to the French priests for damage.

The Mohammedans now clamoured for recognition. Lugard went to meet them, and succeeded in bringing back Mbogo, a half brother of Mtesa—Karema had died—to Kampala, and in assigning them three minor divisions of Uganda (since reduced to one).

A British Protectorate.—Lugard on his return to Uganda at the end of 1891 had received orders to evacuate the country with his whole force, as the I.B.E.A. company could no longer maintain their position. A reprieve till the end of 1892 followed, funds having been raised by the Church Missionary Society and friends. The lives of many Europeans were at stake, for anarchy must follow withdrawal, and the repudiation of British pledges to the natives. Moreover abandonment would have left the headwaters of the Nile to fall into the hands of some other—possibly hostile—European power. In June 1892, therefore, Lugard determined to leave for England to appeal against the decision for abandonment. Williams remained in Uganda, where the outlook was now fairly promising, and every effort was made to reduce expenses.

On arrival in England Lugard found that the British Government had decided not to give the company any help to maintain its hold upon Uganda. A strong section of the Liberal party, headed by Sir William Harcourt, demanded the abandonment of Uganda; an equally strong agitation was set on foot for its retention, with the result that Lord Rosebery (then prime minister) despatched Sir Gerald Portal to report on the best means of dealing with the country. Portal and his staff reached Uganda in March 1893, the country at the time showing every mark of returning prosperity. Portal was not long in making up his mind; he recommended to the imperial government the retention of Uganda (*i.e.*, Buganda), the abandonment of Unyoro (Bunyoro) and Toro, and the construction of a railway half-way only to the lake. He departed after two and a half months' residence, leaving Capt. J. R. L. Macdonald in charge.

In Nov. 1893 Colonel (Sir Henry) Colvile arrived to take charge, and at once led the Baganda army against King Kabarega of Bunyoro. That country was completely overrun and Colvile built a line of forts from Buganda to Lake Albert, of which he left Major A. B. Thruston in command. In June 1894 Uganda (*i.e.*, the kingdom of Buganda) was declared a protectorate, and at the end of the year Sir Henry Colvile was invalided. Peace seemed assured in Uganda; territorial limits to religious teaching were abolished, English Roman Catholic priests were added to the French Fathers, and the material progress of the country was marked. A few European traders settled in the country, good permanent houses were built, roads were made and kept in repair, and many new industries introduced, chief among which were the expression of oil from various oilseeds and the cultivation of coffee. Trees were imported and land set aside for planting forests. In 1896 the building of a railway from the coast to Uganda was begun. In the same year the protectorate was extended over Bunyoro and Busoga.

The Sudanese Mutiny.—In the middle of 1897 this era of peace was rudely interrupted. Macdonald had returned to East Africa in command of an exploring expedition, for which Colonel Trevor Ternan, the acting commissioner, had been ordered to supply 300 Sudanese. In June George Wilson, sub-commissioner at Kampala, discovered a plot to revolt, and in July Mwanga fled to the south of Buddu and raised the standard of rebellion. The rebels were defeated, while Mwanga was made a prisoner by the Germans. Ternan, unaware of the disaffection of his men, now sent three companies to Macdonald, selecting those who had been continuously fighting in Bunyoro, Nandi and Buddu. This caused great discontent, which was increased by the fact that their pay was six months in arrears and their clothing long overdue. The men, too, had other grievances; they were especially sore at again being sent on service without their wives.

After Colonel Ternan's departure on leave the three companies who had joined Macdonald broke out into revolt in the Nandi district (East Africa Protectorate) and set off to Uganda, looting the countries they passed through. Macdonald and F. J. Jackson followed with a force of Zanzibaris. Meanwhile Major Thruston—a man justly loved by his soldiers, in whom he had complete confidence—hurried to the garrison at Luba's near the Ripon Falls, relying on his personal influence to control the men. He and two other Europeans were seized and made prisoners. On Oct. 19 the mutineers were defeated by Macdonald's force. The same night the Sudanese leaders, fearful lest their men might submit, murdered Thruston and his companions and sent letters to Uganda to incite their comrades to mutiny. Wilson, however, had already disarmed the troops in Kampala, who remained loyal, as also did the Baganda Mohammedans there. A large Protestant army now went to the assistance of Macdonald, and up to Jan. 9, 1898, the siege of Luba's continued, with constant skirmishes. Early in January Mwanga escaped from the Germans, and, declaring himself a Mohammedan, reached Buddu with a large force, which Macdonald defeated with the aid of the Baganda army. Meanwhile the Sudanese at Luba's escaped and crossed the Nile, making their way to Mruli. It appeared probable that if they reached that point the Sudanese garrisons in Bunyoro would revolt as well as the Baganda Mahommedans, and the situation of the Europeans became desperate. Macdonald pursued the mutineers overtook them in the swamps of Lake Kioga, and after a coupl of skirmishes returned to Kampala, leaving Captain E. G. Har rison in command. That officer attacked the rebel stockade a Kabagambi and carried it with great gallantry. A large numbe of Indian troops arrived early in 1899 and in May Colonel C. G Martyr inflicted another heavy defeat on the mutineers at Mrul Mwanga, however, managed to get through and join Kabareg and the rebels in the north. In June 1899 Colonel J. T. Evatt ha the good fortune to capture both Mwanga and Kabarega, wh were subsequently removed to the Seychelles, where Mwang died in 1903. (For Kabarega *see* UNYORO.) Colonel C. Delm Radcliffe subdued the last of the Sudanese mutineers in 1900–190

In the autumn of 1899 Sir Harry Johnston was sent out t Uganda as special commissioner and he remained there till 190 During that period he settled many disputes, included Toro Ankole, Bukedi and other regions in the protectorate, reduce expenditure and increased revenue. He gave the kingdom o Buganda a definite constitution, settled the land question in tha kingdom and in other regions and also the question of nativ taxation. The land settlement had very important, if undesigned results for its effect was to do away with tribal tenure and sub stitute the freehold and leasehold system, with certain unde sirable results. By the treaty of Mengo, signed in March 1900, th young king of Buganda, Daudi Chwa, a son of Mwanga, born i 1896, was accorded the title of his highness the Kabaka. Durin his minority the kingdom of Buganda was governed by regents. O these the most notable was Sir Apolo Kagwa (d. 1927), a tru statesman. An epidemic of sleeping sickness, which betwee 1901 and 1909 caused over 250,000 deaths, did not prevent th country making progress, the material development being accom panied by the conversion of most of the Buganda to Christianity The completion in 1902 of the railway from the Indian ocean t Lake Victoria did much to facilitate trade. With settled condition the administration was transferred, 1906, from the Foreign to th Colonial office, Sir Hesketh Bell being the first governor.

Social Conditions.—Christianity and Western civilization in creasingly made their influence manifest, while material prosperit brought new problems. Uganda being, however, a "black man' country," there was no clash between European and Africa interests. Officials and missionaries continued to play a leadin part in the evolution of the people, and they were backed up b the native administration of the various states included in th protectorate, which have a large degree of autonomy. Daud Chwa, who attained his majority on Aug. 8, 1914, and wa created a K.C.M.G. in 1925, and Sir Apolo Kagwa, who on ceas ing to be regent became prime minister, were foremost in givin aid to the British in the World War. Other rulers and tribes wer equally willing, and by supplying 10,000 soldiers, a native medica corps and over 160,000 carriers Uganda helped substantially t defeat the Germans in East Africa.

The country suffered from a severe famine in 1919 and from th general trade depression in 1921–2. But it quickly recovered In cultivating cotton, an industry which started on a small scal in 1904 and 20 years later had attained great proportions, the natives found an easy method of acquiring wealth; a fact no without danger and adversely affecting the labour supply for othe work. However, there was steady growth in education and a power of adaptability to new conditions was clearly noticeable At a critical period of development Uganda owed much to the wise guidance of Sir R. T. Coryndon, governor from Feb. 191 to Sept. 1922. It was during this period, in 1921, that a (nomi nated) legislative council was created.

Being dependent upon the railway through Kenya Colony fo her outlet to the sea Uganda had with that colony a customs and railway union. The question of political federation, which was raised after the World War, presented, however, difficulties arising chiefly from the presence of a large white population in Kenya, whereas Uganda depended upon the African for prosperity. It was chiefly to meet the demands of the native cotton-grow ers in Uganda that the railway extension was undertaken which on its completion in 1928 enabled the crop to be sent direct to

ıbasa. In January, 1929, a Commission, with Sir E. Hilton ıg as chairman, recommended the appointment of a High ımissioner for Kenya, Uganda and Tanganyika, with execu- powers. This was to be "a preliminary step" to a Governor- eralship for "Eastern Africa." Action (May 1929) had yet ı taken on the Report. The cotton exported during 1926 was 359 bales, of the value of approximately £3,500,000. The ıe duty of 6 cents (¾d.) per lb. collected by the Government Jan. to Dec. 1926 amounted to £199,897.

HLAND, JOHANN LUDWIG (1787–1862), German , was born at Tübingen on April 26, 1787. He studied juris- ence at the university of his native place, but also devoted h time to mediaeval literature. Having graduated as a doctor ws in 1810, he went for some months to Paris; and from 1812 814 he worked at his profession in Stuttgart, in the bureau of ninister of justice. He had begun his career as a poet in 1807 1808 by contributing ballads and lyrics to L. von Seckendorff's *enalmanach;* and in 1812 and 1813 he wrote poems for Kerner's *Poetischer Almanach* and *Deutscher Dichterwald.* ınd's ballads follow the form of the masterpieces of Goethe Schiller, but they have some of the spirit of naïve wonder of mediaeval poet, *i.e.,* they belong definitely to the Romantic ool. But his style has a precision and grace which distinguish best work from that of most of the contemporary Romantic s. His work strengthened the national spirit, and he himself good practical work as a liberal member of the Württemberg mbly, and, later, as a member of the Frankfurt parliament. 1815 he collected his poems in a volume entitled *Gedichte.* almost every new edition he added some fresh poems. He e two dramatic works—*Ernst, Herzog von Schwaben* and *wig der Baier*—the former published in 1818, the latter in 9.

hland was not only a poet and politician; he was also an nt student of the history of literature. In this field he pub- ed *Das altfranzösische Epos* (1812); *Der Mythus von Thôr i nordischen Quellen* (1836); and *Alte hoch- und nieder- sche Volkslieder* (1844–45). He died at Tübingen on Nov. 1862.

hland's *Gesammelte Werke,* edit. by H. Fischer, were published in in 6 vols.; also by L. Fränkel (2 vols., 1893) and L. Holthof 1). His *Gedichte* passed through nearly 50 editions in the poet's me; jubilee ed. of the *Gedichte und Dramen* (1886). A critical by E. Schmidt and J. Hartmann appeared in 1898 (2 vols.). ınd's *Schriften zur Geschichte der Dichtung und Sage* were pub- d in 8 vols. (1865–73); his *Tagebuch von 1810–1820* by J. Hart- n (1893). *See* H. Maync, *Uhlands Jugenddichtung* (1899); H. ıeider, *Uhland. Leben, Dichtung, Forschung* (1920).

JHRICHSVILLE, a city of Tuscarawas county, Ohio, A., 85 m. S. by E. of Cleveland, on Stillwater creek and eral highway 21; served by the Baltimore and Ohio, the nsylvania and electric railways. Pop. (1920) 6,428 (95% ve white). Coal is mined in this region, and the city is one he principal centres in the country for the manufacture of er pipe and other clay products. It was settled about 1803 and rporated in 1832.

JIGHUR, the name of a Turkish tribe and dynasty who e from the East and ruled in Kashgaria from the 10th to 12th century. They used a variety of the Syriac alphabet. e TURKS.)

JIST (oist), **NORTH AND SOUTH,** islands, outer Heb- s, Inverness-shire, Scotland. North Uist lies south-west of ris (Long island), from which it is separated about 8 m. by Sound of Harris. The island measures 13 m. in length by m. in greatest width, but the coasts are extremely indented. highest point is Mt. Eaval (1,138 ft.). The principal sea-lochs are Loch Maddy and Loch Eport, both on the east. On the east coast the surface is mostly swampy moorland, but on the west there is some fertile soil. The inhabitants are chiefly engaged in crofting, fishing and cattle-rearing. The principal village, Loch-maddy, is a trade centre, and a favourite resort of anglers, being a regular calling station for the steamers from Glasgow and Kyle of Lochalsh. The islands belonging to the parish of North Uist (pop. 2,579) comprise—to the south-west Baleshare (pop., 134), Kirkibost, Heisker (66), and the Monach group, with a lighthouse on Shillay; to the south, Grimisay (315) and Ronay; to the north-east, Levera; to the north, Boreray (63) and Vallay (43).

South Uist has a population in the parish (1921) of 3,235, an extreme length of 27 m. and an extreme width of 7 m. Towards the north-east it is mountainous. The chief sea-lochs are Loch Boisdale, frequented by anglers, Loch Eynort and Loch Skiport on the east coast. On the east side the surface is mainly alluvial peat, broken by hills, but on the west there is a belt of productive land. Besides crofting, the inhabitants are engaged in the fisheries and cattle-raising. Steamers from Glasgow, Portree, Oban, etc., call regularly at the village of Lochboisdale, where there is a wireless station. The islands attached to the parish of South Uist include, to the south, Eriskay (pop. 427), where Prince Charles landed on Aug. 2, 1745; to the north-east, Wiay; to the north, Grimsay; Flodday, just off the north-east shore of Benbecula; and Benbecula (pop. 1,116), with an area of 40 sq.m., from which there are low-tide fords to North Uist and South Uist.

UITENHAGE, 33° 46′ S. 25° 27′ E.; altitude 169 ft.; 21 m. by rail from Port Elizabeth, South Africa. Pop. (1921) 7,815 whites, 3,187 natives, 160 Asiatics, 3,052 coloured; in 1926 the whites numbered 8,121. The town was founded by De Mist in 1804, on the Zwartkops river. Water-courses flow along the sides of the streets, which are lined with trees. On the banks of the river are two large wool-washing establishments. In the town are railway workshops, the main industry of the place.

UITOTOAN (WITOTOAN), a group of tribes of South American Indians, forming an independent linguistic stock. The Uitotos (Witotos), from whom the stock takes its name, and the tribes related to them live in the region of the Peruvian-Colombian border, between the Yapura and Putumayo rivers, especially on the Caraparana and Igaraparana, northern tributaries of the latter. The Witotos are a short, dark-skinned folk, with almost negroid faces. They are on a lower level of culture than their neighbours in many respects. On the other hand they have developed the drum language to a surprisingly high point. Their religious beliefs and mythology are of great interest.

See T. Koch-Grüneberg, *Zwei Jahre unter den Indianern* (Berlin, 1909); K. Th. Preuss, *Religion und Mythologie der Uitoto* (Leipzig, 1921).

UJIJI, a town of East Africa, on the east side of Lake Tanganyika, in 4° 55′ S. and 29° 40′ E. Pop. (1926) about 25,000, largely Swahili. Ujiji was the meeting point of merchants from all parts of the lake and the terminus of a caravan route from Dar-es-Salaam. The Zanzibar Arabs made it their headquarters in the first half of the 19th century and it became a great slave and ivory mart. In 1858 Richard Burton and J. H. Speke reached Ujiji, being the first white men to see Lake Tanganyika. David Livingstone, coming from the south, reached Ujiji in 1869, and it was there that H. M. Stanley found him on Oct. 28, 1871. The first steamer on the lake was launched at Ujiji in 1884. Soon afterwards it became part of German East Africa and was chosen as the lake terminus of the railway (completed in 1914) from Dar-es-Salaam. Owing, however, to an alteration in the level of Tanganyika, Ujiji harbour had become very shallow and the terminus of the railway is at Kigoma, 4 m. to the north. Ujiji was occupied by Belgian Congo troops in 1916, and in 1921 was transferred to Great Britain as part of the mandated territory of Tanganyika.

UKRAINE, a socialist soviet republic of European Russia, recognised by the Soviet government in December 1920, when a treaty was signed defining the relations between the Ukraine and the Union of Socialist Soviet Republics. Area 451,730 sq.km. Pop. (1926) 28,887,007. It lies between 46° and 52° 20′ N. and

26° 10′ and 40° 14′ E. and is bordered on the south by the Black Sea, the Crimean A.S.S.R. and the Sea of Azov, on the west by Bessarabia, on the north by the White Russian S.S.R. and the province of Bryansk and on the north-east and east by the provinces of Kursk and Voronezh and by the North Caucasian Area. The Moldavian A.S.S.R. (*q.v.*) is linked administratively with the Ukraine.

GEOLOGY AND CLIMATE

Geologically and structurally the Ukraine is distinct from Russia to the north of it; the Tertiary sea covered most of it, but extended very little further to the north, and the ice of the glacial epoch hardly reached it, except in the north-west and where Don and Dnieper mark southward extensions of glacial river systems. Its plateau system, the Azov Horst of Suess, composed of granite gneisses, stretches north-westwards from the Sea of Azov through Volhynia and Podolia, and is generally supposed to be the eastward continuation of the Hercynian system. This horst exerted a strong tectonic effect on the fold system of the Donetz which was thrown up from the end of the palaeozoic to the beginning of the Tertiary period, and also caused the tectonic disturbances of the post-Cretaceous period indicated by the lines of Karpinsky, a northern line stretching from the Volga through the bend of the Don, the source of the Donetz, the delta of the Desna and Polyesie to Warsaw and a southern from the delta of the Don, past the falls of the Dnieper to the source of the Bug. Recent seismic observations indicate that tectonic disturbances are still going on in the district and there is some evidence that elevation of the plateau region has occurred in post-glacial times.

River Formations.—The chief rivers are the Dniester, Bug, Dnieper and the Donetz, a tributary of the Don; tectonic disturbances may account for their parallelism. The soils of the region fall into three main groups. In the ancient forest zone of Polyesie, where morainic clays and sands form the base, are ash-coloured or podzol soils. (*See* RUSSIA: *Soils.*) A zone of black earth formed on loess under steppe climatic conditions lies south of this region, but the humus content has been diminished by the spread on it of forests as the moister and milder climatic zone pushed southward. The town of Kiev stands on the northern limit of this zone and its rise may be connected with the lesser density of the forest on the loess to the south of it. Spurs of the central Russian plateau are thrust into the north-west.

But the main feature of the Ukraine is its steppe land, covered with *chernozyom* (black earth) formed on loess, more sandy to the north and more clayey to the south. The rich black earth belt runs generally south-west to north-east, diminishing in humus content towards the north and towards the south. In the south-east, in accordance with more arid conditions, it displays a tendency to salt efflorescences. Along the north shores of the Black Sea extends the Pontic steppe. The Black Sea was part of an Upper Miocene and Sarmatian Sea, which formerly extended inland as far as the Vienna basin, but which shrank in Tertiary times; the Pontic steppe bears traces of this transgression. It approaches the sea by a steep incline only broken by the river estuaries, characterised in this region by *limans*. These are submerged, eroded river valleys locked from the sea by detritus.

Where a stream of great volume enters the sea (*e.g.*, Dniester, Bug, Dnieper), the bar is pierced in one or two places and something resembling a delta is formed. But in the case of those streams which do not bring down enough water to cover the loss from evaporation in the liman, the bar becomes continuous and the water within the liman is increasingly rich in salts. The mud of these limans has curative properties and small health resorts are dotted along their shores. Along the river valleys are thickets of sedge and reed, with marsh forest and meadow. The Pliocene lime which predominates in the Pontic steppe covers the crystalline substratum, which is, however, often laid bare by the action of streams. Forest destruction at the source of the streams has led to flooding after each melting of the snows. The heavy mantle of black earth and loess, the loose chalk and the marl, sand and clay of the Tertiary strata on the Ukrainian steppe are readily cut into by running water, and many acres of fertile agricultural soil have been washed away from the ravine slopes. An institute for research into amelioration of this problem now exists and efforts are being made to prevent further forest cutting, to encourage replanting and to introduce transverse ploughing across the slopes and drainage channels round the fields.

The chief river is the Dnieper (*q.v.*) which has formed one of the links between the Black Sea and the Mediterranean and the Baltic from ancient times. The Pripet river joins the Dnieper a little south of the northern boundary of the Ukraine and almost doubles its volume, the Dnieper from this point often dividing into two or more channels, and having many islands. The right bank is high and rocky and the left a low plain, though in three places the plain extends along both banks. During the melting of the snows the river overflows the islands and the plains along its shores, leaving them covered with fertile alluvium. At the mouth of the left bank Samara tributary both banks of the Dnieper become precipitous. The post-Tertiary elevation of the Azov horst forced the river to dig its bed into the granite-gneiss rocks, but in many places ledges of these rocks lie across its path and it descends in a series of waterfalls, now being harnessed for production of electric energy. Below the falls the river expands, flowing in several channels, and silting up its liman so quickly that constant dredging is necessary to keep the port of Kherson open even for small sea-going vessels. Of its numerous Ukrainian tributaries, the Teterev and Ingulez on the right, and the Desna on the left, are the most important, the latter being navigable for a great distance.

The present scheme of electrification of the falls includes a scheme for deepening the river channel so as to make it available for large steamers and for providing adequate canals in this region. The lower course of the Dniester (*q.v.*) forms the boundary between Bessarabia and the Ukraine. Its left bank Ukrainian tributaries are short, and flow from the Volhynian-Podolian plateau. They are full at the melting of the snows and have carved deep canyons, but in summer they almost disappear. Between the Dniester and the Bug, no river reaches the sea, all being shut in by limans. The Bug (*Boh*) is a shallow stream, not navigable even after the spring thaws except near its mouth, and its tributaries in summer become mere chains of ponds; rapids are formed in its bed by ledges of the granite-gneiss horst. The upper course of the Donetz with its white chalk cliffs lies in the Ukraine. On the whole the waterways of the Ukraine are not favourable to navigation, the Dnieper and its tributaries giving the greatest possibilities. In 1926–27 there were 76 motor driven boats and 188 barges on the rivers and the freightage carried, mainly grain, timber and metal goods, was 872,000 tons, the number of passengers being about two million.

Climate.—The climate is everywhere continental, but increasingly so towards the south-east. The Ukraine south of a line through Dnepropetrovsk to Kishinev differs from the north in being exposed to east and south-east winds which prevent the snow brought by the south winds from the Black Sea from becoming very thick. If these easterly winds are prolonged and intense, the snow hardly remains at all, this being a contributory cause of bad harvests. Sometimes these east winds bring snow and are so cold and violent that the flocks of sheep are destroyed.

Other causes of bad harvests are a rainless spring, and the return of easterly winds and frosts in May. The maximum rainfall is in summer and falls mainly in heavy showers which may wash away parts of the surface and which, in any case, run off quickly. Winter is severe, the average temperature at Kiev, lat. 50° 30′ N., in January being 1° C, colder than that of Hammerfest, lat. 70° 35′ N. The duration of frost on the Pontic steppe is 2 months and in the rest of the Ukraine 3 to 4 months. Spring in the south is liable to dry east winds bringing sandstorms, but towards the north-west it is moister, with frequent alternations of snow and frost. In summer most of the Ukraine lies south of the 20° C isotherm and high temperatures prevail in the south in July and August. The amount of rainfall diminishes from the north-west (550 mm.) to the south-east (300 mm.) and yearly fluctuations especially in the important spring rains are great; the bad harvests of 1921 and 1924 were due to spring droughts.

Forests.—In former times forest and forested glades covered

n of the area, coniferous in the north and west, and oak in the
u, and patches of forest still remain especially in the north-
and in the Kharkov district. The beech occurs in a small
m west of Kamenets Podolsk. The Pontic steppe is practi-
treeless and probably never had much forest except along the
per river, where it still extends as far as Kherson and is found
tches south of that town. Forest clearing was going on as
as the time of the Kiev principality. Later the Mongols
Tatars destroyed huge stretches of forest by setting fire to it,
y to provide pasture grounds for their flocks and partly to pre-
the Slavs from taking refuge in the forest. In the 16th cen-
the colonising Cossacks continued the process and also prac-
y exterminated the wild horses, deer and bison.
nally the intensification of colonisation in the 19th century so
nished the forests that at present only 8% of the Ukraine is
r timber, of which 23% is coniferous and 64·6% deciduous.
abundant wild life of the region has disappeared, the saiga
ope has retreated eastwards and only rodents, especially field-
and marmots, the plague of agriculture, are abundant. The
of bird life has increased insect pests, though the locust
h once did so much damage, has been exterminated. Destruc-
use of fine meshed nets, so that young as well as adult fish
caught, has markedly lessened the pike, tench, carp, crucian
shad in the rivers, and the sturgeon and sterlet which formerly
med up their lower courses are fast disappearing.

AGRICULTURE AND INDUSTRIES

our-fifths of the population are engaged in agriculture and
pite of the destruction of the years of civil war 1917–21 and
famine of 1921, production in 1926–27 had reached about 90%
ne 1913 level. Despite war conditions and deaths from famine,
population has increased by 8·7% since 1913; rapid increase
opulation has always been a feature of the Ukrainian race.
increase of population in a region of lessened agricultural
luction and markedly diminished manufacturing output has
further impoverished the peasantry, and the two features
gricultural life which have been so marked a result of this
ndity of the race, emigration and seasonal wandering in search
ork, still persist. The redistribution of land after the revolu-
diminished the number of landless peasants, but 4·4% are
landless.
nce the revolution and famine also, there has been a change
ne type of cultivation, maize, which is a more drought resisting
n now occupies more than twice the share of 1913, and rye,
toes, sunflower-seed, hemp, grasses and cultivation of melons,
r melons and cucumbers are markedly above the 1913 level.
ey, wheat and sugar beet are below that level. The many field
em is rapidly replacing the three-field system, artificial man-
are increasingly used and mechanical traction in place of the
ner reliance on horses and oxen is slowly making its way; the
ants in many cases combine to purchase more up-to-date agri-
ural implements; here, as elsewhere in Russia the demand for
implements exceeds the supply. In good years a surplus of
n for export is produced, but in drought years there is insuffi-
t grain for the needs of the population.
tock raising is important, especially sheep and pig breeding;
former has surpassed the 1913 level, but the number of pigs
ss. Horses and working cattle are also below pre-war level,
they were deficient then; the crisis in lack of power for agri-
ure has been partly met by the use of tractors, more than
o having been imported into the Ukraine since 1924. Meat,
ner and wool are exported. Communal farms and artels are
easing and pay special attention to improving the breeds of
nals. The most important communal agricultural enterprise
ne sugar trust which farms half a million hectares.
he manufactures depending on agricultural products in pre-
times occupied a smaller share than metal manufactures, but
resent they surpass them; the depression of the metal trades
the more rapid return to normal conditions of food products,
her goods and textiles has been a common feature in most of
countries affected by the 1914–18 war. This is partly due
he more complex nature of the laws of demand and supply in
metal industries and partly to the greater initial capital needed for construction and repair of plant. Flour milling is everywhere important, especially near the Black Sea ports and macaroni production is increasing. Sugar refining diminished markedly during the disturbed conditions of 1917–1922, the peasants giving up sowing of sugar beet in their need for food grains. In 1925 a revival set in and by 1927 sugar-refining had reached $\frac{3}{5}$ of its former level, syrup production has not yet revived to any great extent. Oil-pressing, brewing, distilling and tobacco manufactures are important. A marked post-revolution feature is the development of leather preparation and the manufacture of leather goods and textiles, previously peasant industries, on factory lines. Smaller agricultural occupations are vine growing, fruit-cultivation and bee-keeping. Apples, pears and cherries are produced in the north and apricots, almonds and peaches in the south. A recent development is the cultivation of *kenaph,* which is replacing jute in the manufacture of sacking.

MINERALS

Minerals.—Of the mineral wealth, rock salt from Artemovsk (Bakhmut) and salt from the *limans* of the Kherson region, have long been exploited, salt from the latter district being an article of trade in the earliest days of Kiev. Before the railways were built, the *Chumakhi,* or drivers of ox-carts, in which dried fish and salt were carried from the Black Sea to all parts of the Ukraine, and exchanged for grain, were a noted organisation. Ox-cart transport is still the only available method in rural districts remote from the railway, the roads being too poor for motor transport. In 1928 a society for road improvement was formed and a "road week" on American lines has been planned to encourage local councils to provide roads suitable for motor transport.

The coal of the Donetz region began to be exploited in the latter part of the 19th century; it includes good anthracite beds and in 1927 production reached 24·5 million tons (97% of the 1913 production), this being 77% of all the coal raised in the U.S.S.R. in that year. The important Krivoi Rog iron region was first developed about 1880 and produced 6·4 million tons in 1913; but in 1927 only 55% of this quantity was mined. Manganese production from the oligocene strata of the Nikopol region, on the other hand, reached 179% of the pre-war level. Phosphorite beds are worked in the west and graphite north of Dnepro-petrovsk. The mercury and copper of the Donetz are little worked at present. Good pottery clays are found everywhere, fireproof clays, in the Donetz, slate near Dnepro-petrovsk, lithographic stone in Podolia and mineral paints in the Donetz, Krivoi Rog and Kherson districts. Building stone, lime, chalk, and gypsum (yielding alabaster) are also found.

Among industries depending on mineral wealth, smelting occupies the first place; the production of cast-iron in 1927 was 77% of that in 1913 and 76% of all the cast-iron produced in Russia. Engine construction, the manufacture of machinery and agricultural implements, steamer building, cycle, motor and aeroplane construction are developing rapidly. The manufacture of electro-technical goods has developed since 1917 as a result of the removal to the Ukraine of two such undertakings from Riga, when that city passed from Russia to Latvia. Chemical industries, including the manufacture of artificial manure are markedly greater than in 1913. Other industries are brick, glass, and pottery manufacture.

Electrification is proceeding rapidly, the Shterov station in the Donetz region, working on anthracite dust, was opened in 1925–26 and has a capacity of 20,000 kilowatts, that at Artemovsk (1928) 22,000 kilowatts, and others have been opened. An important hydro-electric station is under construction (1928) on the falls of the Dnieper, as are sluices to allow vessels carrying corn and naphtha to the north and timber to the south to pass the falls. Cement, aluminium and ferro-manganese factories are being constructed near the falls to work on electricity when the scheme is completed. The export trade of the Ukraine is mainly grain and flour, as in pre-war times and it still fluctuates in dependence on meteorological conditions, though the famine of 1921 led to much more careful selection of drought resisting plants.

Transport.—The network of railways is well developed in the

Donetz region, and there are several east-west and north-south lines; several new lines have been opened and others are under construction. Air transport is developing, the first route being opened in 1925. Regular air services link Moscow, Kharkov and Odessa, with stops at Poltava and Kiev if desired and from Odessa, a regular service goes to Batum.

The Black Sea ports form a trading outlet for the Ukraine, Odessa (*q.v.*) is the most important, others (*qq.v.*) are Nikolayev, Kherson, Mariupol and Berdiansk. There are regular services to the Mediterranean and Vladivostok and there is much coastal trade. Trade through the Baltic Sea ports has been severely injured by the war time destruction of the fleet, by the severance of Bessarabia, by the unsettled external relations of Russia and by the decrease in production, and is far below the 1913 level, though some improvement took place in 1926–27.

Population.—The Ukraine includes within its borders about 20% of the total population of the U.S.S.R., and is one of the most densely peopled regions in Russia, averaging 64·2 inhabitants per sq.km., more than 80% of whom are occupied in agriculture. The village settlements are large and, as a rule, are situated on the high and often precipitous banks of streams, so as to be safe from the spring floods, and they form almost continuous belts along the higher right bank of the rivers. The watersheds are less settled.

In respect of the percentage of people living in towns, the Ukraine occupies third place in the republics of the U.S.S.R., the Transcaucasian Federation coming first and White Russia second, the town population is, however, increasing rapidly, the Ukraine being in a transition stage towards industrialisation. The six largest towns (*qq.v.*) are Kiev (493,873), Kharkov, the administrative centre (409,505), Odessa (411,416), Dnepro-petrovsk (187,357), Stalin (105,739) and Nikolayev (101,182). Seven towns have populations of over 50,000, nine of over 30,000 and ten of over 20,000. Though Kharkov is today considered the capital of the Ukraine, the administration having removed here owing to the unsettled conditions in Kiev, the latter is the real heart of the Ukraine, "the mother of cities" to the Ukrainians, foremost still in population and in its ancient culture dating back to the foundations of the Slav dominion in Russia. The site has been occupied since the dawn of history, and Aurignacian remains have been discovered. Of the whole population, about 80% are Ukrainians (Little Russians), 9% Russians and 5% Jews, other nationalities represented being Poles, Germans, Moldavians, Greeks, Bulgarians and White Russians. The percentage of Russians in the towns rises to 25%, but is small among the agricultural population.

The Ukrainians are broad-headed, tall, long-limbed and broad-shouldered. As a rule they are dark-haired and dark-eyed, and have broad faces, bright complexions and straight noses, though here, as elsewhere there has been racial intermixture and light and medium colouring often occurs. Their language began to be differentiated from Great Russian even in the 11th century, and the wedge thrust between the two peoples by the Tatar domination and the subsequent subjection of the Ukraine to Lithuanian and Polish rule emphasised the divergence.

The use of Great Russian in schools and in printed works was a contributory cause of the illiteracy of the Ukrainian peasant. In 1926 the literacy rate was 41·3% among Ukrainians, as against 45·1% among Russians. Ukrainian is now the official language of the republic and a keen appreciation of the present linguistic freedom has resulted in marked development of education, and at present the Ukraine takes third place in Russia in the provision for education, though here, as everywhere in Russia, many children still receive no education. Kiev, Kharkov and Odessa have scientific and educational institutes and the museums and art galleries of Kiev are famous.

ARCHAEOLOGY

The Ukrainian steppes and South Russia are of peculiar interest historically and archaeologically. Rostovtzeff points out that the French emigrants who found a home in Russia after the Revolution first gave a stimulus to the study of the archaeology of the region. Russian scholars became interested and a copious literature and rich museum collections now exist. The presence of palaeolithic man has been demonstrated at Kiev, and the relics of neolithic man are everywhere abundant. The intersection here of routes from the Orient via the Caucasus and the Black Sea, of Greek influences, of influences from the west via the Danube and from the north via the Dnieper is reflected in the cultural wealth of the early civilisations, while the openness of the steppes to the east led to their repeated submergence by nomads from the steppe. Easy portages connected the rivers, the steppe to the south was open and treeless, while the forests on the loess to the north were younger and less dense than those of the north, and were also intersected by glades: the reasons for the lesser density of forest on the loess steppe are not yet fully worked out.

The conquerors in the region have too often been considered as transitory nomads, but there is ample evidence to prove that the fertility of the region and the ease with which tribute could be extracted from the inhabitants encouraged settlement as well as conquest, thus leading to a rich variety of cultural intermixture. Little is known of the Cimmerians and the extent of their kingdom, but the Iranian Scythians certainly had centres on the steppes between the Don and the Dnieper. These Cimmerian and Scythian kingdoms were the base on which the Greek colonies of the Black Sea depended; later history goes to show that such colonies could not exist without a fairly stable civilisation on the steppe to the north. Sarmatian tribes, Iranians like the Scythians, succeeded to this kingdom, and the blending of Greek and Iranian culture had a marked influence on the civilisations of Central and Eastern Russia.

The neolithic civilisation of the Ukraine, the so-called Tripolye (*q.v.*) culture, named from the finds at that place, as evidenced by its incised and painted pottery was peculiarly rich and belonged to an agricultural people. The kurgan or barrow graves, common to steppe and woodland, and containing skeletons daubed with red paint and buried in the contracted position, though probably contemporary, show evidence of a nomadic people, while graves in the Kharkov district seem to indicate an absorption of the steppe nomads into agriculture. This juxtaposition of settled agriculture and nomadic tribes is still to be observed in the region to the east, where the Kalmucks and some Kirghiz tribes at the present time lead nomadic lives.

In the course of the eighth and seventh centuries B.C. the mouths of the Dniester, Bug and Dnieper were occupied by Milesian fishing colonies, Tyras on the Dniester and Olbia on the Bug and Dnieper. Olbia became the outlet for the furs, slaves and amber of the north and an inlet for Greek influences, which penetrated as far as the Kama; the Milesian power decayed in the fifth century B.C. and Athens took its place in trading relations with Olbia, the corn of South Russia being increasingly needed for the Mediterranean civilisations. With the advance of the Sarmatians to the steppe between the Don and the Dnieper in the second half of the 3rd century B.C. the Scythians moved farther to the north and west, as evidenced by their remains in Kiev and Poltava, but their advance was checked by Germanic tribes, and anarchy began to prevail in the steppe. From their first appearance on the Dnieper the Sarmatian Alans allied themselves with the Germanic tribes in a struggle against Rome and destroyed Olbia and the Roman fortresses on the Crimea. Celtic civilisation in the region is represented in the basin of the Dnieper by La Tène finds, probably remains of the Galatian tribes. Roman influence was felt in the Black Sea region under Hadrian and his successors, who established a fort at Olbia, but in the third century A.D. Roman influence declined on the Ukrainian shore. (R. M. F.)

History.—The people of the Ukraine are for the most part descended from Ruthene immigrants from the north who, to escape the oppression of the Polish and Lithuanian princes and nobles, escaped "to the frontier" where, though nominally under Lithuanian rule, they formed free democratic communities, and came to be known as Cossacks (*q.v.*). The whole Ukraine formed part of the Polish-Lithuanian empire until 1667, when the portion east of the Dnieper was ceded to Russia by the treaty of Andrussowo. The rest was absorbed by Russia at the second partition of Poland, in 1793.

"Great Russians" regarded the Ruthenes as belonging to ıssian nation, and their language as a mere dialect. Towards ıiddle of the 19th century, however, there began in the ıe a separatist movement, associated with the names of the ne scholar Kostomarov and the poet Shevchenko, of which ·litical ideal was the union of all the Ruthenes, including ɔf Galicia, in an Ukrainian nation. This Ukrainophil move- gathered force, and became a very important factor in the s of eastern Europe, especially after the outbreak of the War.

collapse of the Russian empire in 1917, and the downfall Habsburg monarchy which followed, seemed to give the unity for realizing the Ukrainophil ideal. In March 1917 a demand for the recognition of Ukrainian autonomy was :o the Provisional Government at Petrograd, and on April Ukrainian national convention met at Kiev to elect a *rada* :il). This took over the government in June, and was rec- l by the Petrograd Provisional Government in August. On ıber 20, contemporaneously with the Bolshevik revolution rograd, the *rada* proclaimed an Ukrainian People's republic, lependence of which was accepted in principle by the Bol- s, who made no objection when the Central Powers agreed eive the Ukrainian delegates to the conference at Brest- k and to negotiate with them a separate peace.

anuary 1918, however, the situation had altered. A Bol- Government had been set up at Kharkov, and was making headway against the "compromising" Kiev *rada,* and at Litovsk Trotsky now declared that a separate peace with kraine would involve the breaking-off of the negotiations oviet Russia. The news from the Ukraine was, however, un- ; the Central Powers were in urgent need of food supplies southern Russia; and on February 9 they signed a peace with the Ukrainian People's Republic. By subsidiary treat- ned on the 12th, the Ukraine agreed, *inter alia,* to provide s of grain, etc., in return for manufactured articles.

nwhile the Kiev Government had been hard-pressed by the viks and, in March, appealed to the Central Powers for German and Austrian troops now marched into and occu- ıe Ukraine, mainly with the object of securing the stipu- upplies of food, which had fallen far short of expectations. clamation of the German General Eichorn ordering cultiva- be proceeded with, led to a quarrel with the *rada,* which ssolved by the Germans, who made Skoropadski *hetman* of raine. Violent unrest followed among the peasants, who ded the restoration of the People's Republic, and on July 30 l Eichorn was assassinated. An armistice had been con- with Soviet Russia in May. In November, with the col- f the Central Powers, there was a movement against the *a,* headed by Petliura, a former member of the *rada.* Skoro- was overthrown, and Petliura and Vinnichenko, ex-presi- f the People's Republic, established themselves as dictators , where they proclaimed the union of the Ukraine with the Ukrainian republic set up at Lwów (Lemberg) by the Ga- Ruthenes. This led to a short war with Poland, to whom had been assigned by the Allied Powers. Petliura marched aid of the Lemberg Government, which was threatened by vance of General Haller's Polish legion from the Western but was decisively defeated.

eb. 1919 Petliura, driven from Kiev by a Bolshevik ris- ɔk refuge with his armed followers in East Galicia and in ɔined forces with the Poles against the Bolsheviks. Mean- n March 1919, a second Ukrainian Soviet Government had et up, but was dissolved in June, when Denikin's "Whites" kharkov. In December, however, the Soviet forces recap- Kharkov and Kiev, Odessa also falling to them in Feb. nd a third Ukrainian Soviet republic was established. In 920 the Poles, with Petliura's troops, occupied large parts Ukraine, including Kiev, but were forced to retire when ssian Soviet army took the offensive (*see* RUSSIA). By the of Riga (Oct. 12, 1920 and March 18, 1921) Poland and recognised the independence of the Ukraine. On Dec. 28, Russo-Ukrainian treaty was signed defining relations be- tween the two Soviet republics.

During 1921 the Ukrainian Socialist Soviet republic signed separate treaties with Georgia (Jan. 31), Lithuania (Feb. 14), Latvia (Aug. 3), Estonia (Nov. 25) and Italy (Dec. 27); and also, in conjunction with the Russian Socialist Federated Soviet republic, with Austria (Dec. 7). In 1922 a treaty with Turkey was signed (Jan. 2) and, again in conjunction with the R.S.F.S.R., a trade agreement with Czechoslovakia (June 5). On July 6, 1923 the constitution of the Union of Socialist Soviet republics was adopted, of which the Ukraine became a constituent member. In Sept. 1924 the autonomous Moldavian Socialist Soviet republic was formed as part of the Ukraine.

UKRAINIAN LITERATURE. The Ukrainians are the descendants of the South Russians of the Kiev period, and have consequent claims to regard the Russian literature of the 11–13th century as Ukrainian. But as the literary tradition was preserved only in Muscovy, the period has been treated under RUSSIAN LITERATURE (*q.v.*). There is a gap between the last South Russian chronicles of the 13th century and the Ukrainian revival of the 16th, the language of the latter being as different from that of the former as early Middle English is from late Anglo-Saxon.

The Ukrainian literature of the 16–17th century is entirely dominated by the national and religious struggle against Rome and Poland. In its early stages it had its centre in Galicia and Volynia, and produced a polemist of genius in Ivan Vyshensky (*fl.* 1586–1614). Later it became centred in Kiev, and under the influence of Peter Mohila, metropolitan of Kiev (1596–1647), borrowed Latin methods to fight the Latins. The writers of the period were polemists, rhetoricians and grammarians; they also wrote verse and plays after Latin school models. Some of the early 18th century interludes in the latter are of interest. In the later 17th and 18th centuries Ukraine was drained of its best intellectual forces, which were attracted to Muscovy, where the church from 1700 to 1760 was dominated by Ukrainian prelates. After 1750 the Ukrainian gentry began to be rapidly Russianized, many of them attaining to eminence in Russian letters (*e.g.,* Gogol, *q.v.*). Of those that remained Ukrainian the most remarkable was the wandering philosopher and "Christian epicure," Gregory Skovoroda (1722–94). The language used during this period was a mixture of Ukrainian, Church-Slavonic, Polish, and in the later 18th century, Great-Russian elements.

Ukrainian folklore is very rich and original. The best-known type of songs are the so-called *dumy* (collections by Antonovich and Drahomanov, 1874–75; Catherine Hrushevska, part i., 1927). They have an historical background (the Cossack wars of the 17th century), but they are elegiac rather than narrative. There is also a great variety and wealth of the lyrical folksongs. They have had a strong influence on modern Ukrainian literature. The first publications of folksongs by Prince Tsertelev (1819) and Maksimovich (1827) were important landmarks in the first stages of the modern Ukrainian revival.

Modern Ukrainian literature dates from Ivan Kotlyarevsky (1769–1838). His *Travesty of the Aeneid* (1798) and his comedy *Natalka of Poltava* (1816) are closely related to the Russian literary tradition, but the use of the vernacular was a new departure. The successors of Kotlyarevsky did not rise above the level of a provincial *Heimatkunst.* A new spirit was introduced by Taras Shevchenko (1814–61). He was born a peasant and a serf, a fact that emphasizes the essentially democratic and rural character of modern Ukrainian literature. A romantic nationalist in his early, a revolutionary internationalist in his later, work, Shevchenko had deep roots in Ukrainian folklore. He has become the symbol of Ukrainian nationality. His younger contemporary Marko-Vovchok (pseudonym of Marie Markovich, *née* Velinsky, 1834–1907), a Great Russian by birth, wrote stories of peasant life which have made her a standard of good Ukrainian prose.

The persecution of the Ukrainian movement in Russian Ukraine culminating in the practically prohibitive decree of 1876 favoured its growth in Galicia, where such scholars as Michael Hrushevsky (b. 1866), an *émigré* from Russia and Ivan Franko (1856–1916) made of Lwow the centre of Ukrainian culture. Franko

was also the most remarkable Galician novelist of the period. In Russian Ukraine the most outstanding writers were the poetess Lesya Ukrainka (pseudonym of Larissa Kvitka, *née* Kossach, 1872–1913) and the novelist Michael Kotsyubinsky (1864–1913).

The *History of Ukrainian Literature* of M. *Hrushevsky* (1923 *seq.*) has, with its sixth part, reached the middle of the 16th century. It includes many chapters on folklore. For a concise survey in a western language: Comte M. Tyszkiewicz, *La Littérature Ukrainienne* (Berne, 1919); M. Hrushevsky, *Anthologie de la littérature Ukrainienne* (1921). (D. S. M.)

UKULELE. A small guitar (*q.v.*) used by the natives of the Hawaiian Islands and adopted as a jazz and solo instrument in England and the United States.

ULAN (*Uhlan*), originally a Polish lancer. The Ulans were cavalry and wore the national dress and czapka (or lancer cap). They were first introduced into the Prussian army in 1740, but failed to distinguish themselves in the first Silesian War, and it was only after the Treaty of Tilsit (1807) that Ulan regiments were again formed in the Prussian army. In the present (1929) German army the old Ulan regiments are represented in most cavalry regiments by at least two squadrons. In the Austrian army a "Uhlan-pulk" of Poles was formed in 1784 and ordinary Uhlan regiments of Austrian cavalry in 1791. In the present Polish army there are a number of Uhlan regiments.

ULCER. Medically, a breach of either an external or an internal surface, occurring in the course of disease and accompanied by loss of tissue. Common examples are cutaneous, varicose, corneal, typhoid, dysenteric, gastric and duodenal, tuberculous, syphilitic and cancerous ulcers. An ulcer has a depressed floor or base, and often the edges are raised somewhat above the general level of the surrounding surface. In all the instances given above, except the cancerous ulcer, the pathological process at work is inflammation, acting often on a tissue the vitality of which has been lowered, so that the destruction is disproportionately great compared with the agent that brings it about. This lowered vitality may result from constitutional diseases, *e.g.*, diabetes or renal or cardiac disease, or may depend upon local causes, *e.g.*, the poorness of cutaneous blood supply over such a bony surface as the shin, the embolic closure of an artery and death of the portion of tissue it supplies, as in some cases of gastric ulcer. The examples of acute bed sores in disease of the lower parts of the spinal cord, and of perforating ulcer of the toe in locomotor ataxy, indicate further, that in some instances interference with the conduction of afferent impulses from the part is fundamental in ulcer formation.

In a typical ulcer the floor differs in character according as the lesion is healing or not. If healing, the floor consists of granulation tissue (*see* INFLAMMATION AND ITS SEQUELS), covered by a thin layer of sero-purulent fluid, and the edges, when the skin is concerned, show a thin blue line of advancing epithelium whereby the ulcer is finally covered. If recently formed or spreading, the floor usually consists of dead or dying tissue, with smaller or greater exudation of sero-purulent or purulent fluid. In some forms of ulceration, especially those that are chronic, *e.g.*, tuberculous or syphilitic, the floor of the ulcer presents special features (*e.g.*, the presence of giant cells or caseation), and the causal organism may be present in the tissues or exudation. The cancerous ulcer is really an example of molecular necrosis, and the floor consists of dying or dead cancerous tissue, with superposed putrefactive changes. In dyspepsia, small local abrasions on the tongue or mouth or gastric mucous membrane may occur from the breaking down of papules, perhaps containing serous fluid. Popularly these are often termed "ulcers," but they only involve superficial layers of the epithelium, and hardly deserve the name. In its usual significance an ulcer involves tissue deeper than the epidermis, or in the case of internal surfaces, the entire mucous membrane.

Treatment.—The treatment of ulceration is conditioned by the underlying cause. In all cases rest is necessary; an ulcer over the knuckle may persist for weeks if the hand be used, but heal within a day or two if the joint be fixed upon a splint. But apart from this, it is clear that treatment of any underlying disease help healing of the ulcer at least as much as local medicati In the case of cancerous ulcers, healing does not occur apart fr a successful radiation treatment, but the patient's discomfort n be relieved very greatly by keeping the ulcer bacteriologic clean, and thus preventing the putrefaction that otherwise alw occurs. Naturally, this is easier in some situations than oth Sometimes a cutaneous ulcer becomes "indolent" or "callous," remains unchanged in appearance for weeks. Often such an ul may be brought into a healthy healing condition by use of so stimulating lotion, or rubbing with a crystal of copper sulpha the superficial destruction of tissue is thereby increased, it is t but the induced inflammation is accompanied by stimulat processes beneath and around the ulcer, which more than comp sate for the added inflammation. Healing of an ulcer, whet occurs, is always by the local formation of fibrous (scar) tiss in the case of the skin, the newly-formed fibrous tissue is u mately covered by squamous epithelium, in the case of muc membranes the secreting epithelial system is not re-formed.

(W. S. L-B.)

ULEABORG: *see* OULU.

ULEMA, the learned of Islām, theologians, canon-lawy professors, judges, muftīs, etc., all who, whether in office or n are versed theoretically and practically in Muslim science in g eral. (Arab. *'ulamā,* sing. *'ālim,* literally, "knowers," in the se of *scientes*.) By "science" in this case is especially meant wha learned from tradition, books or men, and through the intell In a narrower sense, Ulema is used, in a Muslim state, of a cou of such learned men, holding government appointments. If conception of intermediary priesthood be eliminated, the Ul may be said to be equivalent to the secular clergy of Ro Christendom (*see* DERVISH). Opposed to them, again, are *'ārifs* ("knowers," "perceivers," *sentientes,* as opposed to *scient* to whom religious knowledge comes in the vision of the mys not by tradition or reason (*see* ṢŪFĪISM).

ULFILAS (*c.* 311–383), the apostle of Christianity to Gothic race, and, through his translation of the Scriptures Gothic, the father of Teutonic literature, was born among Goths at the trans-Danubian provinces about the year 311. The Arian historian Philostorgius (*Hist. eccl.* ii. 5) says that grandparents were Christian captives from Sadagolthina in padocia, who had been carried off to the lands beyond the Dan in the Gothic raid of 264, and became so naturalized that the received a Gothic name, *Wulfila* (Little Wolf). An authorita record of the outlines of his life was only discovered early in 19th century in a writing of Auxentius of Milan, his pupil companion. At an early age Ulfilas was sent, either as an en or as a hostage for his tribe, to Constantinople, probably on occasion of the treaty arranged in 332. Ulfilas may therefore h been a convert to Christianity when he reached Constantino But here probably he came into contact with the Arian doctr which gave the form to his later teaching. For some time be 341 he worked as a lector (reader of the Scriptures). From work he was called to return as missionary bishop to his country, being ordained by Eusebius of Nicomedia and bishops who were with him," probably at Antioch, in 341.

He was now thirty years of age, and his work as "bishop am the Goths" covered the remaining forty years of his life. seven of these years he wrought among the Visigoths beyond Danube, till the success which attended his labours drew d the persecution of the still pagan chief of the tribe. To save flock from extinction or dispersion, Ulfilas decided to withd both himself and his people. With the consent of the emp Constantius he led them across the Danube, "a great body of faithful," and settled in Moesia at the foot of the range of H mus and near the site of the modern Trnovo (349).

The life of Ulfilas during the following thirty-three year marked by only one recorded incident (Sozomen iv. 24), visit to Constantinople in January 360, to attend the council vened by the Arian or Homoean party. The part played by Ul in these troublous times cannot be ascertained with certai It may have been he who, as a "presbyter christiani ritus,"

il negotiations with Valens before the battle of Adrianople ; but that he headed a previous embassy asking for leave e Visigoths to settle on Roman soil, and that he then, for al motives, professed himself a convert to the Arian creed, ed by the emperor, and drew with him the whole body of ntrymen—these and other similar stories of the orthodox historians appear to be without foundation. The death of , followed by the succession and the early conversion to licism of Theodosius, dealt a fatal blow to the Arian party the empire. In 383 he was sent to Constantinople by peror. A split seems to have taken place among the Arians stantinople. Ulfilas was summoned to meet the innovators, induce them to surrender the opinion which caused the e. No sooner had he reached Constantinople than he fell 'having pondered much about the council," and before he ut his hand to the task which had brought him he died, ly in January 383.

Arianism of Ulfilas was a fact of pregnant consequence for ople, and indirectly for the empire. It had been his lifelong as we learn from the opening words of his own confession— Ulfilas semper sic credidi." If, as seems probable from the stances of his ordination, he was a semi-Arian and a fol- of Eusebius in 341, at a later period of his life he de- from this position, and vigorously opposed the teaching former leader. He appears to have joined the Homoean which took shape and acquired influence before the council nstantinople in 360, where he adhered with the rest of the il to the creed of Ariminum, with the addendum that in the terms *ὑπόστασις* and *οὐσία* should be excluded from ological definitions. Thus we learn from Auxentius that he mned Homoousians and Homoiousians alike, adopting for f the Homoean formula, "filium similem esse patri suo." version of the Scriptures is his greatest monument. By it sed a barbarian tongue to the dignity of a literary language; he skill, knowledge and adaptive ability it displays make it owning testimony of his powers as well as of his devotion to ork. For the linguistic value of the Gothic version of the ures by Ulfilas *see* GOTHS: *Gothic language*. It is preserved, only in a fragmentary form, in the famous Codex Argen- Uppsala. This ms., discovered at the monastery of Werden, Cologne, was deposited at Prague, carried off by the Swedes 8 and presented to Queen Christina. From Stockholm it by some means into the hands of Isaac Vossius, and a ript was made and published by Franciscus Junius in 1655. s. was bought by the Count de la Gardie and presented to iversity of Uppsala. Its uncial letters are formed in silver rface of purple vellum.

A. Scott, *Ulfilas, Apostle of the Goths* (1885); Balg ed. *The First Germanic Bible* (1891); H. M. Gwatkin, *in Arianism* (1900); Felix Dahn, *Die Könige der Germanen* 1911). (C. A. Sc.; X.)

IANOVSK, a province of the Russian S.F.S.R. lying west Volga river, with the Chuvash A.S.S.R. and the Tatar R. to the north, the provinces of Nizhegorod and Penza to est, and Samara to the east. Area 34,986 sq. kilometres. 1926) 1,381,300. It occupies part of the former Simbirsk ce. The south-east is occupied by the mid-Russian plateau, ch a part, known as the Zhegulev hills thrusts out a tongue compels the Volga to make its great Samara bend. The a rises in the Samarskaya Luka hills and flows parallel to the but in an opposite direction, at a distance of 2 to 20 miles. ura, flowing north, drains the west of the province and a navigable waterway. The geological formations include liocene upper layers containing mammoth bones.

re are extensive beds of bituminous shale with a high ic value on the Volga-Svyaga watershed; and in 1919 work gun at the Kashpir shale mine south of Syzran, and the shale to Samara for fuel for electric plant. By-products are used manufacture of sulphur, ichthyol, shale-tar, fireproof ma- , etc. Asphalt is worked at Syzran. Salt, ochre, iron-ore and various building stones are produced in small quantities. There are patches of forest, but local demand for fuel, building and household purposes exceeds supply by more than 70% and the timber used in the province is mainly imported. The soils vary from rich black earth to grass-covered alkaline sands, and there is much water meadow along the rivers. The climate is continental, ranging between extremes of −47° F and +115° F, winter lasts for five months, and the rainfall is about 17·6 in. per annum. Spring rains sometimes fail and cause severe famines, as in 1911 and 1921. Destructive hailstorms often occur in June and July.

Agriculture is the main occupation and 83·9% of useful land is cultivated, though mainly on a three-field system, with primitive implements. Maize cultivation is increasing and efforts are made to spread its use among the peasants for food and cattle fodder. Winter rye and oats are the chief crops. Wheat, lentils, sunflower seed, potatoes, cabbages, onions and melons are also grown, and there is some cultivation of flax and hemp. Stock raising diminished disastrously after 1921, but sheep, goats and pigs have almost reached their normal level. Of factory industries the making of woollen goods, flour-milling, distilling and brewing are the chief, and there are some saw-milling, brick-making, nail and leather factories. Koustar or peasant industries include the making of tombstones, saddlery, nets, purses and violins and guitars. They diminished markedly after the famine.

There are only two towns with populations of more than 20,000, Ulianovsk and Syzran (*q.v.*). The literacy rate is very low, 26·8% for the whole province and 17·8% among women. The district was originally peopled by Finnish tribes; Russian colonization began on the west of the Sura in the 14th century and reached the east two centuries later, lines of forts being established to protect the settlers; Ulianovsk (Simbirsk) was thus erected in 1648. Communications are mainly by river; the railway system is poor.

Ulianovsk (formerly Simbirsk), the chief town of the province, lies on a hill 560 ft. above the Volga at a point where the Svyaga closely approaches it, in 54° 23′ N., 48° 25′ E. Pop. (1926) 70,194. Its suburbs extend to the Svyaga and to the Volga. Suburbs on the left bank of the Volga are cut off from communication during the spring and autumn, but are reached by boat in summer and sleigh in winter. The town has a brisk river trade and has saw-mills, flour-mills, breweries, distilleries and brick-yards. It has railway communication across the Volga and with the west. The historian Karamzin was born here in 1766. Ulianovsk was the scene of much fighting during the Civil War of 1917–1920.

ULLSWATER, JAMES WILLIAM LOWTHER, 1ST VISCOUNT (1855–), Speaker of the British House of Commons (1905–1921), was born on April 1, 1855, the son of William Lowther, M.P. He was educated at Eton, Kings college, London, and at Trinity college, Cambridge. He represented Penrith in the House of Commons from 1886 to 1921, when he received a viscounty. Lowther had been deputy-speaker for ten years when he was elected to the chair of the House. He was a great Speaker, filling the duties of the office with humour, dignity and discretion. He was chairman of the Speaker's Electoral Reform conference (1916–17), which prepared the way for the great extension of the franchise, including the granting of votes to women; of the Devolution conference (1919); and of the royal commission on London Government (1921–22).

ULM, a city of Germany, in the republic of Württemberg, situated on the left bank of the Danube, at the foot of the Swabian Alps, 58 m. S.E. of Stuttgart by rail and 63 m. N.W. of Munich. Pop. (1925) 57,278. Ulm is mentioned as early as 854; it became a town in 1027, and was soon the principal place in the duchy of Swabia. Although burned down by Henry the Lion, it soon recovered from this disaster and became a free imperial town in 1155. Its trade and commerce prospered and in the 15th century it attained the summit of its prosperity, ruling over a district about 300 sq.m. in extent, and having a population of about 60,000. In 1803 it lost its freedom and passed to Bavaria, being ceded to Württemberg in 1809. In October 1805 General Mack with 23,000 Austrians capitulated here to Napoleon. Ulm is remarkable in the history of German literature as the spot where the Meistersingers lingered longest, preserving without text

and without notes the traditional lore of their craft.

Ulm still preserves the appearance of a free imperial town, and contains many mediaeval buildings of historic and of artistic interest. Among these are the town hall, of the 16th century, in the Transition style from late Gothic to Renaissance, restored in recent years; the Kornhaus; the Ehingerhaus or Neubronnerhaus, now containing the industrial museum; and the commandery of the Teutonic order, built in 1712–1718 on the site of a habitation of the order dating from the 13th century, and now used as barracks. The magnificent early Gothic cathedral, begun in 1377, and carried on at intervals till the 16th century, was long left unfinished; but in 1844 the work of restoration and completion was begun, being completed in 1890. It has double aisles and a pentagonal apsidal choir, but no transepts. Its length (outside measurement) is 464 ft., its breadth 159 ft.; and the aisles are covered with rich net-vaulting. The tower in the centre of the west façade was completed in 1890, and is the loftiest ecclesiastical erection in the world (528 ft.). The cathedral contains some fine stained glass, and a number of interesting old paintings and carvings. It belongs to the Protestant Church.

The Danube, joined by the Iller just above the town and by the Blau just below, here becomes navigable, so that Ulm occupies the important commercial position of a terminal river-port. There is water communication with the Neckar, and so to the Rhine. The market for leather and wool is important, and the manufactures include wire ropes, borax, paints, cheese, jute, leather, lace, perfumes, and cement. Brewing and weaving, iron- and brass-founding are carried on as well. As a fortress Ulm has been famous and it is a garrison town.

Fischer, *Geschichte der Stadt Ulm* (Stuttgart, 1863); Pressel, *Ulmisches Urkundenbuch* (Stuttgart, 1873); and *Ulm und sein Münster* (Ulm, 1877); Schultes, *Chronik von Ulm* (Stuttgart, 1881 and 1886); Hassler, *Ulms Kunstgeschichte im Mittelalter* (Stuttgart, 1872); and *Das rote Buch der Stadt Ulm,* edited by C. Mollvo (1904).

ULMACEAE, a family of dicotyledonous trees, the best known and most important members of which are the elms (*q.v.*), forming the genus *Ulmus*. The family contains 13 genera and about 130 species. *Celtis australis* is the nettle-tree, the fruit of which is edible. *C. occidentalis* is the hackberry (*q.v.*).

ULMANIS, KARL (1877–), Latvian statesman, first prime minister and organizer of the independent republic of Latvia. Born Sept. 4, 1877, in Zemgale (Courland). He is an agronomist. He also studied agriculture in Germany and the United States of America, and, before Latvia became an independent State, he gave many lectures in Latvia on agricultural questions. He was an active supporter of the movement to liberate the Latvian people from Russian and German domination. After the Allied victory of 1918, when Latvia was still occupied by German military forces, he organized all political parties in Latvia around the Democratic block, which later in the same year, united with other political organizations of Latvian refugees in Russia, became the Latvian National Council. On behalf of this national council and in the name of the Latvian nation, the independence of Latvia was proclaimed on Nov. 18, 1918, and K. Ulmanis was appointed first prime minister of the interim Latvian Government. Under his leadership the young State waged its fight for freedom against the Russian Bolshevists and the combined German and Russian irregular forces, *i.e.,* the Bermondt army.

After the Latvian army's complete victory, K. Ulmanis led his country until the Constituent Assembly was elected and gave the country a Constitution. Peace was concluded with Russia and Germany, and the young State concentrated all its force on the reconstruction and building up of the administration.

Ulmanis was prime minister from Nov. 18, 1918, to June 18, 1921, when a Coalition Government was formed by his party colleague, Z. Meierovics. He was again prime minister from Dec. 24, 1925, to May 5, 1926, and from that date until Dec. 17, 1926, he was minister for foreign affairs.

He is leader of the strongest bourgeois party in the parliament, the Farmers' Union, is a member of the Latvian parliament, and, notwithstanding the fact that he has a strong opposition in the left wing political parties, is still considered the most popular and strongest political figure in Latvia.

ULPIAN (Domitius Ulpianus), Roman jurist, was of Tyrian ancestry. His literary activity lay between 211 and 2 He made his first appearance in public life as assessor in *auditorium* of Papinian and member of the council of Septim Severus; under Caracalla he was master of the requests (*magi libellorum*). Heliogabalus banished him from Rome, but on accession of Alexander (222) he was reinstated, and finally came the emperor's chief adviser and *praefectus praetorio.* curtailment of the privileges granted to the praetorian guard Heliogabalus provoked their enmity, and he narrowly esca their vengeance; ultimately, in 228, he was murdered in palace, in the course of a riot between the soldiers and the m

His works include *Ad Sabinum,* a commentary on the *jus ci* in over 50 books; *Ad edictum,* a commentary on the Edict, in books; collections of opinions, responses and disputations; bo of rules and institutions; treatises on the functions of the differ magistrates—one of them, the *De officio proconsulis libri x.,* bein comprehensive exposition of the criminal law; monographs on vari statutes, on testamentary trusts, and a variety of other works. writings altogether have supplied to Justinian's *Digest* about a t of its contents, and his commentary on the Edict alone about a fi As an author he is characterized by doctrinal exposition of a h order, judiciousness of criticism, and lucidity of arrangement, s and language.

Domitii Ulpiani fragmenta, consisting of 29 titles, were first ed by Tilius (Paris, 1549). Other editions are by Hugo (Berlin, 18 Böcking (Bonn, 1836), containing fragments of the first book of *Institutiones* discovered by Endlicher at Vienna in 1835, and in Gira *Textes de droit romain* (Paris, 1890).

ULSTER, EARLS OF. The earldom of Ulster was first title of honour in Ireland of English creation, and for m than a century was the only one. It dates from a grant to Lacy in 1205.

Hugh de Lacy, 1st Earl of Ulster (d. 1242?), was descend from Walter de Lacy (d. 1085), who fought for William Conqueror at Hastings. The first earl was the brother of Wal de Lacy (d. 1241), who succeeded his father as lord of Heath 1186. In 1203 Hugh de Lacy drove John de Courci out of Do and was rewarded by grants of land, and in 1205 by the earld of Ulster. He was then invested with quasi-viceregal authori but in 1207 war broke out between the earl and the king's j ticiar. King John came to Ireland, and banished the earl Scotland. He returned to Ireland in 1226, and died at Carri fergus. On his death the earldom reverted to the Crown.

Second Creation.—Prince Edward (afterwards Edward I transferred "the county of Ulster" (*c.* 1255), to Walter de Bur lord of Connaught. The earldom remained in the family of Burgh until the death of William, 3rd earl of this line, in 13 when it passed to his daughter Elizabeth, who married Lion afterward duke of Clarence, son of Edward III. Lionel was s ceeded in the earldom of Ulster by his daughter Philippa, w married Edmund Mortimer, earl of March. The third Mortim earl of Ulster, died unmarried in 1425, when his titles were herited by Richard Plantagenet, duke of York, whose son Edwa ascended the throne as Edward IV. in 1461.

Since that date the earldom of Ulster, which then merged the Crown, has only been held by members of the royal fami Its last holder was Alfred, duke of Edinburgh (d. 1900).

O'Donovan (7 vols., Dub 1851); The *Annals of Loch Cé,* edited by W. M. Hennessy, "R Series" (2 vols., 1871); *Calendar of Documents Relating to Irela* edited by H. S. Sweetman (5 vols., 1875–86); W. W. Shirley, *Royal a Historical Letters of the Reign of Henry III.,* "Rolls Series" (2 vo 1862–66); Sir J. T. Gilbert, *History of the Viceroys of Ireland* (Dub 1865). For the later history of the earldom *see* G. E. C., *Compl Peerage,* vol. viii. (1898).

ULSTER, a province of Ireland occupying the northern p of the island. Before the passage of the Government of Irela Act, 1920, and the establishment of a separate government Northern Ireland (*q.v.*), Ulster included the counties of Doneg Londonderry, Antrim, Fermanagh, Tyrone, Cavan, Monagh Armagh and Down (*qq.v.*). Ulster (*Uladh*) was one of the ea provincial kingdoms of Ireland, but by A.D. 400 became divid

hree states, Oriel (Oirghialla) in the south, Ulidia in Antrim own, and Aileach or Tír Eoghain in the north. The O'Neills r Eoghain became dominant over all Ulster, but after the an invasion Ulidia fell to John de Courcy and formed the om of Ulster, while Oriel was partitioned. In the 15th century sh rule practically disappeared from Ulster which, under the lls and O'Donnells became the most Gaelic province of Ire- and found two great champions of native independence in and Hugh O'Neill, Earl of Tyrone, whose grandfather Conn ccepted this English title in 1543. With the suppression of e (1603) the province was subjected to the Crown, and the t of the Earls (1607) gave the opportunity for the planta- f Ulster by English and Scottish settlers (*see* PLANTATION). istory is henceforth part of the national history.

TIMATUM, a formal intimation by one state to another that unless the latter complies with certain terms certain quences will follow. These consequences may be war or ures short of war; *see* INTERNATIONAL LAW (PUBLIC); IC BLOCKADE; REPRISALS; LAWS OF WAR.

declaration of war may be either absolute or conditional. r the customary law of nations prevailing at the time of the -Japanese War, 1904, hostilities might be commenced with- ny formal notice. In this conflict Japan was charged by Rus- ith making a treacherous attack. Japan replied that she had ly severed diplomatic relations before taking action. This oversy led to the provisions contained in The Hague Conven- III., 1907, whereby hostilities must not commence without ous and explicit warning in the form either of a declaration ar, giving reasons, or of an ultimatum with a conditional ration of war. Further the existence of a state of war must otified to the neutral Powers without delay, and does not effect in regard to them until after the receipt of notification, may be given by telegram. Nevertheless, neutral Powers ot rely on the absence of notification if it is clearly estab- l that they were aware of the existence of a state of war. e World War, Austria-Hungary and Germany declared war legram. Great Britain verbally informed the German Govern- that unless it withdrew its troops from Belgium, she would steps to secure its neutrality. The German minister accepted s a declaration of war. Italy verbally informed the Austro- arian ambassador at Rome that she considered herself in a of war, and telegraphed the Italian ambassador at Vienna ake a similar declaration. This declaration with a reasoned nent was dispatched to Italian representatives abroad and eign governments. The United States declared a state of war Germany by a resolution of Congress, approved by the Pres- The majority of other states at war with Germany made no l declarations of war against her allies. Some merely broke plomatic relations. (H. H. L. B.)

LTIMOGENITURE, the custom by which the youngest nherits the homestead, is known in English law as Borough sh. In England it obtained in parts from Gloucester to ridgeshire. Under the name of Mainète and Jungerrecht it nown in northern France and northern Germany. In Assam found among the matrilineal Garos who possess the rganization and speak a Tibeto-Chinese language, among the lineal Khasias who speak an Austric language, among ineal Lusheis, Meitheis, Nagas and Kachins, speakers of o-Chinese languages. Cases are known in Africa.

s custom has been regarded as derived from the *jus primae* , the youngest son being of undoubted paternity. This view een successfully traversed by Blackstone, Westermarck and r. It has been ascribed among settled peoples, such as Nagas Meitheis, to the custom of making provision for the elder as they marry and set up house independently. The rule ing elders to marry before juniors is found among com- ies which do not now practise ultimogeniture. Among people he Lusheis, who practise shifting cultivation, it is due to stom by which the sons of chiefs, on marrying, swarmed found new villages. The view that it is connected with tic worship—proffered by Elton and accepted by Gounne— ported by the Khasi evidence, where the youngest daughter "inherits the religion"—in organic association with the homestead. With the Garos it is inseparably connected with the general system of marriage.

See Blackstone's *Commentaries on the Laws of England,* vol. ii.; O. Elton, *Origins of English History,* 1st ed. (1888); E. Westermarck, *History of Human Marriage,* 5th ed.; Sir J. Frazer, *Folklore in the Old Testament* (1918).

ULTRAMARINE occurs in nature as the colouring principle of *lapis lazuli,* from which it was originally obtained by crushing the stone and separating the pure material by levigation. The scarcity of the mineral, which is a double silicate of sodium and aluminium with some combined sulphur, and the low yield obtainable rendered genuine ultramarine extremely costly and the pigment to-day is manufactured solely by artificial means. The raw materials used consist, briefly, of (1) kaolin (China clay) free from iron and manganese, (2) soda ash, (3) anhydrous sodium sulphate, (4) finely powdered sulphur, (5) charcoal, ash-free coal or colophony, and (6) silica or quartz. In the "indirect process" these materials are intimately mixed and ground and heated in a furnace at a bright red heat for 7–10 hours with exclusion of air, then allowed to cool slowly. Sulphur is added to the green ultramarine so formed and the mixture is converted into blue ultramarine by further heating at a low temperature. In the "direct process" the raw materials, as above, after mixing and grinding are roasted in an oven with access to air.

Artificial ultramarines are divided into three classes distinguished as the lighter "sulphate ultramarine," "ultramarine poor in silica" (dark blue) and the "ultramarine rich in silica"; the last, which is made by the direct process, is darkest in colour with a reddish tinge and, unlike the first two, made by the indirect process, is very resistant to alum solutions (hence is largely used in the paper trades). Ultramarine is fast to light and alkalis but is readily destroyed by mineral acids. Owing to the beauty of its colour, its cheapness and permanence, it is extensively used as a water, size, lime, oil and varnish colour; in printing inks; as a corrective for whites; for colouring paper; and in the ceramic industry. As it is liable to contain free sulphur, it is incompatible with lead pigments. The sodium in ultramarine may be replaced by lithium, potassium and silver, and the sulphur by selenium or tellurium. Ultramarine violet is obtained by heating ultramarine blue in a furnace with ammonium chloride. Ultramarine red is prepared by the action of hydrochloric acid on ultramarine violet at a high temperature. These colours are rarely met with in commerce. *See* PAINTS, CHEMISTRY OF.

(R. S. M.)

ULTRAMONTANISM, the name given to a certain school of opinion in the Roman Catholic Church (Lat. *ultra,* beyond, *montes,* the mountains). The expression *ultramontane* was originally no more than a term of locality, characterizing the persons so described as living—or derived from—"beyond the mountains"; but from the very beginning we find it used as a party appellation to describe those who looked "beyond the mountains" in order to obtain a lead from Rome, who represented the papal point of view and supported the papal policy. Thus, as early as the 11th century, the partisans of Gregory VII. were styled ultramontanes, and from the 15th century onwards the same name was given to the opponents of the Gallican movement in France.

It was not until the 19th century that "ultramontane" and "ultramontanism" came into general use as broad designations covering the characteristics of particular personalities, measures and phenomena within the Roman Catholic Church. At the present time they are applied to a tendency representing a definite form of Catholicism within that Church; and this tendency, in spite of the individual forms it has assumed in different countries, everywhere displays the same essential features and pursues the same ends. It follows, from the very nature of Ultramontanism, and from the important position to which it has attained, that the official organs of the Church and all the people interested in the continuance of the actual state of affairs deny that it exists at all as an independent tendency. It is indisputably legitimate to speak of Ultramontanism as a distinct policy, but it is very difficult to define its essential character.

(i.) The first and fundamental characteristic of Ultramontanism is its carrying to a logical issue the concentration of all ecclesiastical power in the person of the Roman Pontiff. (*See* PAPACY.) To the *curial system*, so evolved, continually fortifying its position in the domains of theology, ecclesiastical law, and politics, the *episcopal system* stands in opposition. The system admits that the pope represents the unity of the Church, and acknowledges his primacy, while at the same time it claims on behalf of the bishops that, in virtue of the divine ordinance, they possess an inalienable right to a share in the government of the Church (*see* CHURCH HISTORY; FEBRONIANISM). The struggle between these two systems continued well into the 19th century; and, though episcopalism was not infrequently proscribed by the Curia, it still survived, and till the year 1870 could boast that no oecumenical council had ventured to condemn it. This was done for the first time, in 1870, at the Vatican Council (*q.v.*), whose decrees, recognizing the universal episcopate and the infallibility of the pope, marked the triumph of that doctrine by which they had been long anticipated. The Catholic Church, in all countries, has become more and more dependent on the Curia: the bishops have lost their autonomous standing, and their position is little more than that of papal delegates, while all important questions are referred to Rome or settled by the nuncios.

(ii.) A second peculiarity of Ultramontanism is that it claims for the Catholic Church the functions of a political power, and asserts that it is the duty of the secular state to carry out its instructions and wishes. Since the conditions of the age no longer allow the pope to depose a temporal sovereign, the practical application of this conception of the relationship between the spiritual and temporal powers has taken other forms, all of which, however, clearly show that the superiority of the Church over the State is assumed. This may be seen in the attitude of Ultramontanism towards secular law. It assumes that God has conferred on the individual and on society certain rights and competences as inalienable possessions. This "natural law" ranks above all secular law, and all state legislation is binding only in so far as it is in harmony with that law. As to the provisions of this natural law, and the consequences they entail in individual cases, these can be decided only by the Church, *i.e.*, in the last resort, by the pope. Thus, even at the present time, the opinion is very clearly expressed in Ultramontane quarters that, in the event of the state issuing laws contravening those of nature or of the Church, obedience must be refused. The attitude of Ultramontanism, for instance, towards the right claimed and exercised by the state to make laws concerning marriage is wholly negative; it recognizes no marriage laws except those of the Church, the Church alone being regarded as competent to decide what impediments are a bar to marriage, and to exercise jurisdiction over such cases.

(iii.) Since Ultramontanism cannot hope to realize its political ambitions unless it succeeds in controlling the intellectual and religious life of Catholic Christendom, it naturally attempts to extend its sphere of influence in all directions over culture, science, education, literature and the forms taken by devotion. The development of these efforts may be easily traced from decisions of the Congregation of the Index and the Holy Office in Rome. Ultramontanism, too, labours systematically to bring the whole organization of education under ecclesiastical supervision and guidance.

(iv.) In the fourth place, Ultramontanism is the embodiment of that intolerance towards other creeds which is the logical consequence of the authoritarian claims of the Catholic Church. The general presupposition involved is that a man cannot be saved except within the Catholic Church. Since, however, on the one hand—in virtue of a theory advanced by Pius IX. against the emperor William I. of Germany, in a letter which has since become famous—every Christian, whether he will or no, belongs to that Church by baptism, and is consequently pledged to obey her, and, on the other hand, since the state lies under the obligation to place the "secular arm" at her disposal whenever one of her members wishes to secede, the most far-reaching consequences result. In the past this principle led to the erection of the Inquisition (*q.v.*) and, even at the present day, there exists in the Curia a special congregation charged with its application. The gradu separation of State and Church, a process traceable in its vario degrees in all countries of Europe, has resulted in rendering i possible the strict application of system to which human natu itself has, rightly or wrongly, taken exception. As a result of t situation, the Catholic condemnation of heresy—though as strin ent as ever in principle—has assumed forms less physically dange ous for the heretic.

(v.) Lastly, Ultramontanism opposes the nationalization Catholicism. This peculiarity is connected, though not identic with the above-mentioned tendency towards the Romanizati of the Church. Just as in Protestant countries there has oft been an amalgamation of evangelical belief with national feelin so many Catholics desire that Catholicism shall enter into t sphere of their national interests, and that the activities of t Catholic Church should rest on a national basis. These aspiratio have been proclaimed with especial emphasis in France, in Ge many (*Reformkatholizismus*) and in the United States (*Amer canism; see* HECKER, I.T.); but they are everywhere met with blank refusal from the Ultramontane side. Ultramontanism fea that any infusion of a national element into ecclesiastical li would entail the eventual separation of the people in questi from papal control, and would lead to developments fraught wi danger to the supremacy of the Papacy.

A MUCH DISPUTED PROBLEM

The relationship of Ultramontanism to Catholicism is a muc disputed problem. The Ultramontane maintains that there no justification for distinguishing between the two; but, ev within the pale of the Roman Church, the identification provok dissent, and is repudiated by all who are shocked by the effec on the life of the Church of an over-centralized political Catho cism. It was on these grounds that in Jan. 1904, it was propos in the chamber of the Bavarian Reichsrath that the clergy shou be deprived of the suffrage. The years between the Treaty Frankfurt (1871) and the outbreak of the World War witnesse a growing difficulty on the part of Catholic Germans to reconci Ultramontane doctrine with the political and industrial develo ment of united Germany. This was the real background of wh is known as the *Kulturkampf* (*see* GERMANY, *History*).

The collapse of Germany after the World War (1914–1 tended, on the whole, to stimulate Ultramontanism (*e.g.*, Bavaria); but the republican elements which combined in 19 to uphold the Constitution of Weimar, proved strong enough resist the more extreme manifestations of this tendency.

It may be admitted that for all the principal contentions Ultramontanism, analogies may be found in the past history the Catholic Church. Thus, in the middle ages, we find extreme bold pronouncements with respect to the position of the papac in the universal Church; while political Catholicism had its begi nings in antiquity and found very definite expression, for instanc in the bull *Unam sanctam* of Boniface VIII. Again, the attemp to subordinate all intellectual life to ecclesiastical control was feature of the mediaeval Church, and the fundamental attitude that Church towards heresy was fixed during the same perio But since then much has been altered both in the Church and h secular environment. The State has become independent of th Church, legislates on its own sole authority, and has recognize as falling within its own proper sphere the civilizing agencies ar social questions formerly reserved for the Church. Again, edu cation, science, art and literature have been secularized; th printing-press carries knowledge into every house, the number illiterates diminishes from year to year in every civilized country and the clergy are no longer the exclusive propagators of cultur but merely one factor among a hundred others.

The origin of modern Ultramontanism is preceded and con ditioned by the collapse of Catholicism in the period of the Frenc Revolution. Pius VI. and Pius VII. were expelled from Rome deprived of the papal States, and banished to France. In tha country the Church almost completely lost her possessions; i Germany they were at least considerably curtailed; in both th hierarchical organization was shattered, while the Catholic lait

yed the catastrophe in complete passivity. But from this e fall the Church recovered with comparative readiness, he upward movement is contemporaneous with the rise of montanism. The birth of that system, however, cannot be as a definite event by the day and the hour; nor was it ed by any single personality. Rather it was the product of rst post-revolutionary generation. Neither is it merely for- us that the reaction proceeded from France itself. For in no country had hostility to religion attained such a pitch or ned such grotesque forms; and consequently in no other ry did the yearning for religion manifest itself so unequivo- when experience had demonstrated the necessity of a return w and order. And in the other States of Europe there existed, or less, a similar desire for peace and an equal dread of a outbreak of revolutionary violence. In contrast to the strug- or an ideal freedom, which was at first hailed with tempes- s delight only to reveal itself as a dangerous tyranny, men ne conscious of the need for a firmly established authority in econstruction of society. At the same time, the repression of ism and sentiment during the period of "illumination" was y revenged, and the barren age of reason gave place to Ro- icism. These tendencies in contemporary opinion favoured enovation of the Catholic Church.

e papacy signalized its reinstation by restoring the Society of s (1814) and re-establishing the Index. In Germany Ultra- anism had to contend with great difficulties; for here ecclesi- al affairs were not in so desperate a case that the most drastic dies possessed the most powerful attraction; while, in addi- the clergy were unwilling to renounce all scientific work. result was that a series of struggles took place between the Catholicism and the new Ultramontanism. But even here montanism gained ground and derived inestimable assistance the blunders of government after government. The growth esuitical influence at Rome—more especially after the re- of Pius IX. from exile—implied a more definite protection ltramontanism by the papacy. The proclamation of the a of the Immaculate Conception in 1854 was more than the ion of an old and vexed theological problem; it was an act of ormity with a pietistic type especially represented by the ts. The Syllabus of 1864, however, carried with it a recogni- of the Ultramontane condemnation of some aspects of modern re (*see* the articles PIUS IX. and SYLLABUS). Finally, in the an Council, the Jesuits saw another of their favourite theories t of papal infallibility—elevated to the status of a dogma of Church (*see* VATICAN COUNCIL and INFALLIBILITY).

LUNDI (Zulu for "high place"), the royal kraal of Cety- , situated in the Mahlabatini district of Zululand, about N. of the White Umfolosi river, and 115 m. N.N.E. of an. The valley of the White Umfolosi here forms an ex- ve basin called the Emhlabatini, and from the time of Chaka e overthrow of Cetywayo in 1883 was the exclusive place of ence of the Zulu kings. The basin on the south side of the is regarded as the cradle of the Zulu race; here all their chiefs are buried, hence the term Emakosini (*i.e.*, at the of the chiefs) applied to the district (*see* Blue Book C.). During Cetywayo's reign a garrison of 3,000 was kept at di. About a mile from the kraal on July 4, 1879, a Zulu army 20,000 strong was totally defeated by Lord Chelmsford. The British loss was about 100, the Zulu 1,500. After the fight the royal kraal was burned. On Sept. 1, at the site of the kraal, Sir Garnet (afterwards Lord) Wolseley announced the partition of Zululand into thirteen petty chieftainships; but on Jan. 29, 1883, Cetywayo was reinstalled by the British at Ulundi as chief over two-thirds of his old dominions. Attacked at Ulundi in July 1883 by the rival chief Usibepu, Cetywayo and his 5,000 followers fled to the Nkandhla bush. The royal kraal was again destroyed and Ulundi ceased to be a rallying point. The magistracy for the district is situated 5 m. N. of the site of Ulundi. (*See* ZULULAND.)

ULVERSTON, market town, urban district, Lonsdale parliamentary division, Lancashire, England, in the Furness district, 8 m. N.E. from Barrow-in-Furness, and 256 m. from London by the L.M.S. railway. Pop. (1921) 10,121. The church of St. Mary, founded in 1111, retains the original (Transitional) south door, but is mainly Perpendicular in style with an altar-tomb of 1588. Ulverston is second in importance to Barrow in the Furness district. Conishead Priory, 2 m. S.E., a mansion on the site of a priory founded in the reign of Henry II., is now a hydropathic establishment. Formerly Ulverston had a considerable trade in linens, checks and ginghams, but is now dependent on iron and steel works, chemical works, breweries, tan-yards, and hardware, paper, and wooden hoop factories. Through its connection with Morecambe bay by a ship canal, 1 m. in length, it has a shipping trade in iron and slates.

Ulverston, otherwise Vlureston, Olvestonum, occurs in Domesday Book, where Vlurestun is named as a manor in possession of Turulf, who was probably the original Saxon owner. Early in the 12th century the manor passed to Stephen, count of Boulogne, who gave it to Furness Abbey. In 1196 the abbot granted the vill of Ulverstone with the inhabitants to Gilbert Fitz-Reinfred, who granted it a charter and made it a free borough. The lordship became divided. One part passed to the Harringtons and finally to Henry Grey, duke of Suffolk, on whose attainder in 1553 it was forfeited to the Crown; the other, returned to the abbey at the dissolution, was surrendered to the Crown. Early in the 17th century the Crown alienated the manor, now in the family of Buccleuch. The yearly court-leet and court-baron are still held in October. In 1280 Roger de Lancaster obtained a charter from Edward I. for a weekly market on Thursday and an annual fair of three days on the eve of the Nativity (Sept. 7).

ULYSSES: *see* ODYSSEUS.

UMBALLA or AMBALA, a city and district of British India, in the Punjab. The city is 3 m. E. of the river Ghaggar, 902 ft. above the sea. Pop. (1921), 76,326. It has a station on the North-Western railway, with a branch line to Kalka at the foot of the hills (39 m.), which was continued up to Simla in 1903. Umballa owes its importance to a large military cantonment which was first established in 1843. The cantonment, which lies 4 m. south-east of the native town, is well laid out with broad roads.

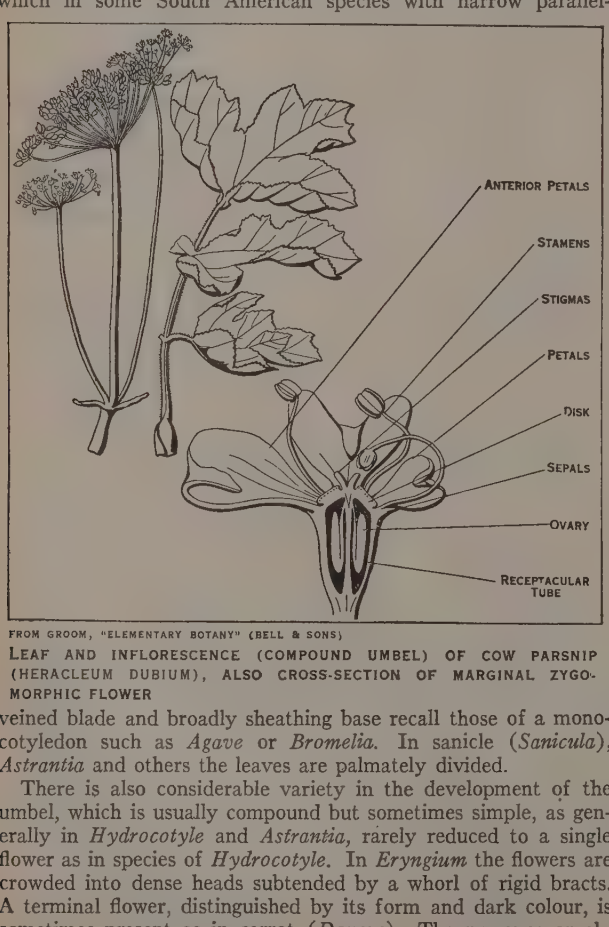
The DISTRICT OF UMBALLA has an area of 1,882 sq.m. With one small exception it consists of a level alluvial plain, sloping away gradually from the foot of the Himalayas, and lying between the rivers Jumna and Sutlej. These rivers do not materially affect the district, which has a drainage system consisting of the numerous torrents which pour down from the hills. The principal of the northern streams is the Ghaggar, into which the minor streams empty themselves, some within and some beyond the limits of the district. The Ghaggar is the only perennial stream within the district, but dwindles to a tiny rivulet in the dry season, and disappears altogether beyond the border of the district. In 1901 the population was 681,477. The principal crops are wheat, maize, pulse, millets, rice, cotton and some sugar-cane. There are factories for ginning and pressing cotton, and also for grinding wheat. Two opposite corners of the district are watered by the Sirhind and the Western Jumna canals. Umballa is one of the territories previously held by numerous Sikh sirdars, which were attacked by Ranjit Singh. This caused the movement of British troops in 1809 which resulted in the treaty with Ranjit Singh, by which he was required to withdraw his army from the left bank of the Sutlej. In June 1849, after the second Sikh War had brought the

Punjab under British rule, the chiefs were deprived of all sovereign power. In March 1869 a grand durbar was held at Umballa on the occasion of the visit of the amir Shere Ali.

UMBEL, in botany, an inflorescence in which the stalks of the flowers all spring from the top of the main stalk, thus usually producing a flat-topped flower head, as in the carrot, parsnip and fennel. (*See* FLOWER.)

UMBELLIFERAE, in botany, a family of polypetalous dicotyledons belonging to the order Umbelliflorae, which includes also the families Araliaceae (ivy family) and Cornaceae (dogwood family). It contains 200 genera with about 2,700 species, occurring in all parts of the world but chiefly in north temperate regions. It is well represented in the British flora by 35 genera. The plants are annual or perennial herbs, rarely shrubby as sometimes in *Bupleurum,* with generally a very characteristic habit, namely stout erect stems with hollow internodes, alternate pinnately compound exstipulate sheathing leaves and compound umbels of small, generally white, flowers.

An example of an annual is the common fool's parsley, *Aethusa Cynapium;* carrot (*Daucus Carota*) is a biennial; others are perennial, persisting by means of tubers or rhizomes—such are hogweed (*Heracleum*), *Angelica, Peucedanum,* and others. Some genera have a creeping stem as in *Hydrocotyle* (pennywort), a small herb with a creeping filiform stem and, in the British species, entire leaves. *Bupleurum* has simple, entire, often perfoliate leaves. *Azorella,* a large genus in south temperate regions, has a peculiar caespitose habit, forming dense cushions often several feet in diameter and persisting for many years; they resemble those of the Australian *Raoulia* (vegetable sheep). *Eryngium,* represented in Britain by sea-holly (*E. maritimum*), is a large genus of rigid often glaucous herbs with spiny-toothed leaves, which in some South American species with narrow parallel-



FROM GROOM, "ELEMENTARY BOTANY" (BELL & SONS)

LEAF AND INFLORESCENCE (COMPOUND UMBEL) OF COW PARSNIP (HERACLEUM DUBIUM), ALSO CROSS-SECTION OF MARGINAL ZYGOMORPHIC FLOWER

veined blade and broadly sheathing base recall those of a monocotyledon such as *Agave* or *Bromelia.* In sanicle (*Sanicula*), *Astrantia* and others the leaves are palmately divided.

There is also considerable variety in the development of the umbel, which is usually compound but sometimes simple, as generally in *Hydrocotyle* and *Astrantia,* rarely reduced to a single flower as in species of *Hydrocotyle.* In *Eryngium* the flowers are crowded into dense heads subtended by a whorl of rigid bracts. A terminal flower, distinguished by its form and dark colour, is sometimes present as in carrot (*Daucus*). The presence or absence of bracts and their form when present afford useful d agnostic characters. When present at the base of the prima rays of the umbel they form the *involucre,* and the *involuc* when at the base of a partial umbel. In *Astrantia* the simp umbel is enveloped by a large, often coloured, involucre.

The small epigynous flowers are usually hermaphrodite and re ular, with parts in fives. The sepals are usually very small, ofte represented only by teeth on the upper edge of the ovary; th petals are usually obovate or obcordate in shape, often with th tip inflexed; the stamens have long slender filaments bent i wards in the bud but ultimately spreading; the two carpels are the median plane; the two-celled ovary is surmounted by a epigynous glandular disk, which bears the two styles. Eac ovary-cell contains a single pendulous anatropous ovule with ventral raphe and a single integument. The flowers are rendere conspicuous by being massed into more or less dense flat-toppe inflorescences (umbels). A resemblance to the rayed heads Compositae is suggested in the frequently larger size of th flowers on the circumference of the umbel which are often steri and zygomorphic from the larger size of the outer petals. Th arrangement allows a large number of flowers to be visited b insects in a short time. The flowers are generally white, sometim pink or yellow, very rarely blue; they are generally scented, bu the whole plant has an odour from the general presence in th tissues of an ethereal oil or resin. The flower is widely open, th petals and stamens radiating from the central disk, on whic honey is secreted, and is thus accessible to quite short-tongued flie Cross-pollination is rendered necessary by the flowers being ge erally markedly protandrous.

The fruit is very characteristic; a schizocarp which splits dow the septum to form two dry one-seeded mericarps which are first attached to, or pendulous from, an entire or split central ax or *carpophore.* The form of the mericarp affords valuable cha acters for distinguishing genera. On the outer surface of eac are generally five ridges (primary ridges), between which a sometimes four secondary ridges; oil-cavities, *vittae,* are ofte present in the intervening furrows.

The family is divided according to the nature of the flow and fruit (presence or absence of a free carpophore, and of vittae the nature of the endocarp, whether soft or woody). Engl divides the family into three main classes, *Hydrocotyloidea Saniculoideae, Apioideae.* The first two with two subfamilies eac and the last with eight subfamilies. The 35 British genera repr sent seven of the twelve subfamilies. The following may b mentioned: *Hydrocotyle* (pennywort), *Eryngium* (sea-holly *Sanicula* (sanicle), *Conium* (hemlock, *q.v.*), *Smyrnium* (Alex anders), *Bupleurum* (hare's-ear), *Apium* (celery, *q.v.*), *Caru* (caraway, *q.v.*), *Conopodium* or *Bunium* (earth-nut, *q.v.* *Myrrhis* (Cicely), *Chaerophyllum* (chervil), *Foeniculum* (fenne *q.v.*), *Crithmum* (samphire), *Oenanthe* (water dropwort), *Aethus* (fool's parsley, *q.v.*), *Angelica* (*q.v.*), *Peucedanum* (hog's fennel *Pastinaca sativa* (parsnip, *q.v.*), *Heracleum* (hogweed), *Dauc* (carrot). *Petroselinum sativum* is common parsley (*q.v.*).

It is represented in North America by about 70 genera. Th more common ones are *Eryngium* (snakeroot), *Sanicula* (blac snakeroot), *Hydrocotyle* (pennywort), *Osmorrhiza* (sweet cicely *Conium* (poison hemlock), *Cicuta* (water hemlock), *Sium* (wate parsnip), *Thaspium* (meadow parsnip), *Heracleum* (cow parsnip and *Angelica.*

For further details *see* Engler & Prantl, *Die Natürlichen Pflanzenfamilien* (Leipzig, 1887–1908); J. C. Willis, *Flowering Plants an Ferns* (Cambridge, 1925); A. B. Rendle, *The Classification of Flowerin Plants* (Cambridge, 1925).

UMBER: *see* MANGANESE; PAINTS, CHEMISTRY OF.

UMBRELLA ANTENNA, a radio antenna, the conductor of which form elements of a cone with the apex at the top t which the lead-in (*q.v.*) is connected.

UMBRELLA-BIRD, the name for a species of the genu *Cephalopterus,* belonging to the American family Cotingidae The males are black and bear a peculiar umbrella-like crest fron which characteristic the name is derived. They also have long plumed wattle depending from the throat.

MBRIA (Ὀμβρική), the name of an ancient and a modern ct of Italy.

The ancient district was bounded in the period of the Roman macy by the Ager Gallicus (in a line with Ravenna) on orth, by Etruria (the Tiber) on the west, by the Sabine terri- on the south and by Picenum on the east. The Via Flaminia d up through it from Ocriculum to Ariminum; along it lay important towns of Narnia (Narni), Carsulae, Mevania agna), Forum Flaminii, Nuceria Camellaria (Nocera) and m Sempronii; and on the Adriatic coast Fanum Fortunae o) and Pisaurum (Pesaro). To the east lay Interamna ni), Spoletium (Spoleto), Fulginium (Foligno—on a branch ıe Via Flaminia which left the main road at Narnia and ned it at Forum Flaminii) and the important town of erinum on the side of the Apennines towards Picenum. On ide towards Etruria lay Ameria (Amelia) and Tuder (Todi), on the direct road from Rome to Perusia, Iguvium, which pied a very advantageous position close to the main pass ıgh the Apennines, and Hispellum (Spello). Not far off was ium (Assisi), whilst far to the north in the mountains lay na. Under the empire it formed the sixth region of Italy.

ıe name Umbria is derived from the Umbri, one of the chief ituent stocks of the Italian nation. The origin and ethnic ties of the Umbrians are still, like their geographical location rly times (1200–1000 B.C.), quite unknown (Randall MacIver, *Age in Italy* [Oxford, 1927], 140), but their language proves to have been an Aryan people closely allied with the Oscans in a remoter degree with the Latins.

ıe process by which the Umbrians were deprived of their tional predominance in upper and central Italy and restricted ıeir confines of historic times cannot be traced in detail. r easternmost territory in the region of Ancona was perhaps ted from them by the Picenes, a branch of the Sabine stock: it is probable that they were partly displaced in the valley ıe Po by the Gaulish tribes which began to pour across the from about 500 B.C. But their chief enemies were un- tedly the Etruscans (*q.v.*), who eventually drove them into upland tract athwart the Apennines to which the name of ria belonged in historical times without eradicating the rian element of population in the conquered districts. In ria proper the persistence of the Umbrian stock is indicated he survival of numerous Umbrian place-names, and by the rd of Umbrian soldiers taking part in Etruscan enterprises, the attack on Cumae in 524 B.C. Indeed it is not unlikely the bulk of the population in Etruria continued to be of rian origin, and that the Romanization of this country was ltated by the partial absorption of the Etruscan conquerors the Umbrian multitude.

gainst the Romans the Umbrians never fought any wars of rtance. After the downfall of the Etruscan power they made lated attempt to aid their Samnite kinsmen in their decisive gle against Rome (308 B.C.); but their communications with ium were impeded by the foundation of a Roman fortress arnia (298 B.C.), and at the great battle of Sentinum (295 , which was fought in their own territory, the Umbrians ot lend the Samnites any substantial help. It is perhaps on unt of this defection that in 200 B.C. they received from the ans a portion of the Ager Gallicus reconquered from the nian Gauls. They offered no opposition to the construction ıe Via Flaminia through the heart of their country, and in Second Punic War withheld all assistance from Hannibal. In Social War (90–89 B.C.), they joined the rebels tardily and among the first to make their peace with Rome. Henceforth no longer played an independent part in Italian history.

ıe material prosperity of Umbria, in spite of its unfavourable ion for commercial intercourse, was relatively great, owing e fertility of the numerous small valleys which intersect the nine system in this region. The chief products of the soil olives, vines and spelt; the uplands harboured the choicest s of Italy. The abundance of inscriptions and the high pro- on of recruits furnished to the army attest its continued lousness. Among its most famous natives were the poets Plautus (b. at Sarsina) and Propertius (b. at Assisi).

The Umbrians in addition to the city (*tota*) had a larger territorial division in the *tribus* (*trifu,* acc.) as we gather from Livy (xxxi. 2, "per Umbriam quam tribum Sapiniam vocant"; *cf.* xxxiii. 37) and from the Eugubine Tables ("trifor Tarsinates," vi. B. 54). Ancient authors describe the Umbrians as leading effeminate lives, and as closely resembling their Etruscan enemies in their habits. There is conclusive proof of strong Etruscan influences in Umbria, and their alphabet is undoubtedly of Chalcid-Etruscan origin, while the language, which we know from one or two inscriptions from Fulginium and Tuder, and from the so-called Eugubine Tables, the earliest parts of which may go back to the 5th cent. B.C. (*see* GUBBIO) is a dialect which sprang from the Oscan, but is marked by some phonetic changes. Etruria also taught the towns near it, *e.g.,* Tuder and Iguvium, the art of minting, for they alone had a coinage. The Umbrians counted their day from noon to noon. But whether they borrowed this likewise from the Etruscans we do not know. In their measuring of land they employed the *versus,* a measure common to them and the Oscans, $3\frac{1}{3}$ of which went to the Roman *jugerum.*

2. The modern territorial division is situated in the middle of the peninsula, between Tuscany and the Marches on the north and east, and Rome and the Abruzzi on the south and west, and comprising the two provinces of Perugia and Terni, with an area of 3,366 sq.m.; pop. (1921), 638,991. Umbria and the provinces of Ancona and Pesaro and Urbino taken together form an area slightly more extensive than that of the sixth region of Augustus. The surface is mountainous, but affords good pasture, and there are numerous fertile valleys. Many treasures of art and architecture are preserved, and Umbria is in this respect one of the most interesting regions of Italy. (*See* PERUGIA.) Modern Umbria formed down to 1860 a part of the States of the Church.

Two main lines of railway run through the territory. That from Florence to Rome skirts the borders of the province on the west, running north and south, while the Rome-Ancona runs across the province from north-east to south-west. The cross communication is given by three branch lines. In the north a narrow gauge line from Arezzo to Fossato passes through Gubbio. Perugia, the capital of the province, stands on the line from Terontola to Foligno, while on the extreme south a line passing through Rieti and Aquila, and ultimately reaching Sulmona, starts from Terni on the Rome-Ancona line. There is also an electric railway from Terni via Perugia to Umbertide, on the line between Arezzo and Fossato.

The great steelworks of Terni (*q.v.*), the chloride factory at Nera Montoro near Narni, the chemical manure works at Narni, Foligno and Assisi, the wool and jute works of Terni and Foligno, the cotton spinnery of Spoleto may all be mentioned; while the hydro-electric plants of Umbria, which are concentrated at Terni, are of great importance, and are able to help out those of Lazio and Tuscany. In 1926, 334,873 tons of lignite were mined in the province of Perugia. (T. A.)

UMBRIAN LANGUAGE. The dialect in which the *Iguvine Tables* (*see* IGUVIUM) are written is usually known as Umbrian, as it is the only monument we possess of any length of the tongue spoken in the Umbrian district before it was Latinized. The language is that of a certain limited area, which cannot yet be shown to have extended very far beyond the eastern half of the Tiber valley (from Interamna Nahartium to Urvinum Mataurense).

Umbrian has diverged from Oscan in the following matters:

(1) The palatalization of *k* and *g* before a following *i* or *e,* or consonant *i* as in *tiçit* (i.e., *diçit*)=Lat. *decet; mueto* past part. passive (pronounced as though the *i* were an English or French *j*) beside Umb. imperative *mugatu,* Lat. *mugire.*

(2) The loss of final *-d, e.g.,* in the abl. sing. fem. Umb. *tōtā*=Osc. *toutād.*

(3) The change of *d* between vowels to a sound akin to *r,* written by a special symbol 𐌓 (*d*) in Umbrian alphabet and by RS in Latin alphabet, e.g., *teḍa,* in Umbrian alphabet=*dirsa*

in Latin alphabet, "let him give," exactly equivalent to Paelignian *dida*.

(4) The change of *-s-* to *-r-* between vowels as in *erom*, "esse"=Osc. *ezum*, and the gen. plur. fem. ending in *-aru*=Lat. *-arum*, Osc. *-azum*.

To this there are exceptions, *e.g.*, *asa*= Lat. *ara*, which are generally regarded as mere archaisms. Unfortunately the majority of them are in words of whose origin and meaning very little is known, so that (for all we can tell) in many the *-s-* may represent *-ss-* or *-ps-* as in *osatu*=Lat. *operato*, *cf.* Osc. *opsaom*.

(5) The change of final *-ns* to *-f* as in the acc. plur. masc. *vitluf*=Lat. *vitulōs*.

(6) In the latest stage of the dialect the change of final *-s* to *-r*, as in abl. plur. *arver*, *arviis*, *i.e.*, "arvorum frugibus."

(7) The decay of all diphthongs.

(8) The change of initial *l* to *v*, as in *vutu*=Lat. *lavito*.

Save for the consequences of these phonetic changes, Umbrian morphology and syntax exhibit no divergence from Oscan that need be mentioned here, save perhaps two peculiar perfect-formations with *-l-* and *-nçi-*; as in *ampelust*, fut. perf. "impenderit," *combifiançiust*, "nuntiaverit" (or the like).

See C. D. Buck, *Oscan and Umbrian Grammar* (Boston, 1904); R. von Planta, *Oskischumbrische Grammatik* (Strassburg, 1892–97); R. S. Conway, *The Italic Dialects*, vol. ii. p. 495 *seq.*

UNAMUNO, MIGEL DE (1864–), Spanish scholar and man of letters, was born at Bilbao on September 29, 1864. He was educated in Madrid, receiving a doctor's degree in philosophy and letters, and in 1892 was appointed to the chair of Greek language and literature at Salamanca University. In 1900 he became rector of the university. He was always vitally interested in practical affairs and later in a campaign by means of newspaper articles and addresses against governmental corruption and abuses he was so outspoken that he was removed from the rectorship of the university. The *coup d' etat* of Primo d' Rivera in 1923, which established a military directorate, aroused him to such vehement denunciation that in February, 1924, he was exiled to one of the more remote of the Canary Islands. The sentence aroused much criticism and the government granted amnesty in July, 1924, but Unamuno refused to return to Spain and took up his residence in Paris. In letters Unamuno is a man of wide culture and of great influence in Spanish-speaking countries. In his poems there is vigorous thought and lofty passion which strains at the bonds of rhyme, while his blank verse is weighted with mysticism. There are many excellent sonnets in the collection *Rosario de Sonetos liricos* (1911). His most remarkable poem is *El Cristo de Velazquez* (1920), a long series of mystic meditations, which is often compared by critics to the work of Blake. His novels are made impressive by their philosophical quality. Superfluous details and descriptive writing are suppressed and the stage is stripped for the interaction of passions and ideas. *Niebla* (1914), *Abel Sanchez* (1917), *La Tia Tula* (1921) and *Tres Novelas Ejemplares* (1921) are all important, but his masterpiece is generally acceded to be *Del Sentimiento Tragico de la Vida* (1913; trans. into English, 1921). Much of his thought, as well as more colourful descriptive writing, is to be found in the *Ensayos* (7 vols., 1916–19), while warmth of feeling for the people and countryside of Spain are shown in *De mi pais* (1903); *Por tierras de Portugal y de Espana* (1911) and *Andanzas y Visiones* (1922). In the *Vida de Don Quijote y Sancho* (1914; trans. into Eng. 1927) he preaches the cult of quixotism as an ideal.

A number of selections and extracts from his essays are translated in *Essays and Soliloquies* (1925); other translations are *The Agony of Christianity* (1928) and the novel, *Mist* (1929).

UNAO, a town and district of British India, in the Lucknow division of the United Provinces. The town is 10 m. N.E. of Cawnpore. Pop. (1921), 11,147.

The District of Unao has an area of 1,787 sq.m. It consists of a flat alluvial plain, lying north of the Ganges. Rich and fertile tracts, studded with groves, alternate with stretches of waste land and plains of barren *usar*, the whole being intersected by small streams, used for irrigation. The Ganges is the only navigable river in the district, while the Sai forms its north-eastern boundary. Pop. (1921), 819,128.

UNDEN, OSTEN (1886–), Swedish politician, becam professor of civil law at the University of Uppsala in 191 Unden, who was a Social Democrat, became a minister witho portfolio in the Eden Cabinet from 1917 until 1920, and minist of justice in the first Branting Cabinet in 1920. From 1920 1924 he was the expert on international law to the Swedish Fo eign Office; and a member of the Swedish delegation at t Assembly of the League of Nations from 1921 and also at t Genoa and Hague Conferences, 1922. He became foreign mi ister in Branting's third Ministry in 1924 and after the latte death in 1925 Unden succeeded him on the Council of the Leag of Nations. He was especially prominent at the special sessio of the Assembly held in March 1926, when he opposed the ele tion of any other country than Germany to a permanent seat the council. He was one of the committee of three appointed the council to consider the Laidoner report on the Mos boundary, and only agreed to it after much persuasion, holdi that a settlement conciliatory to Turkey was essential.

UNDERGROUND ELECTRIC RAILWAYS COMPANY OF LONDON LIMITED. This company was inco porated in April 1902, and had for its object the construction new Underground Railways in London and the electrification the Metropolitan District Railway. In 1914, the Undergrou Company changed its constitution and became a share and secur ties holding company, mainly in companies concerned in Londo passenger transport. The transport operating companies which controls by its holdings of companies' stocks and shares a (1) the Metropolitan District Railway Company; (2) the Londo Electric Railway Company (comprising the Great Northern, Pi cadilly and Brompton; the Baker Street and Waterloo; and th Hampstead and Highgate Railways); (3) the City and Sout London Railway Company; and (4) the London General Omn bus Company Limited. It also controls the Central Londo Railway Company in consideration of its dividend guarante These five companies are under one control with a common ma agement, and in pursuance of an Act of Parliament secured i 1915 they participate in a Common Fund and are collectivel described as the Common Fund Companies. This Common Fun consists of the balance of the revenue of the several companie after providing for their revenue liabilities: viz., working ex penses, rent, rent charges, interest on loans, debenture, guaran teed and preference stocks and reserves for depreciation an obsolescence. The balance is applied half yearly, first in meetin the deficiency of any of the constituent companies which ma have been unable to discharge its revenue liabilities, and the in distribution among the constituent companies in agreed pro portions. The common fund and common management secur (1) that the several undertakings are treated as one traffic uni and clearance of traffic between them is avoided; (2) increase through-booking facilities; (3) standardization of fares; (4) th elimination of wasteful competition as between the companie involved; (5) stabilization of financial results; (6) the poolin of resources for improvement and extension of the system o transport in London. These advantages are further enhanced b the fact that the Underground Company by its holding of share has a substantial interest in the London and Suburban Tractio Company Limited, which in turn controls (1) the Metropolita Electric Tramways Limited; (2) the London United Tramway Limited; (3) the South Metropolitan Electric Tramways an Lighting Company Limited; and (4) the Tramways (M.E.T. Omnibus Company Limited.

The capital of the Underground Electric Railways Compan of London Limited issued and outstanding at December 31s 1928, was £16,574,510. The capital outstanding of the Commo Fund Companies at that date was £62,622,013 of which £54,241 364 was attributable to the railways. The railway system, entirel electrified, covered 114 route miles, including the lines of othe companies over which it had running powers. In 1928, ove 81 million car miles were operated and over 368 million passenger were carried by these railways.

The London General Omnibus Company in 1928 covered 1,02

miles with its omnibuses, of which the average number ed daily was 4,328. During that year over 205 million service iles were operated and over 1,834 million passengers carried. e three Tramways undertakings named above owned, in 68·63 miles of track, and leased from the Middlesex and ordshire County Councils a further 44·28 miles—a total of 1 track miles. With an aggregate fleet of 553 tramcars, over illion car miles were worked and over 192 million passengers carried. (J. C. Mt.)

NDERGROUND RAILROAD, a term used popularly signate an organized system existing in the Northern States e United States prior to the Civil War by which slaves were tly helped by sympathetic northerners and in defiance of ugitive Slave Laws (*q.v.*), to make their way to Canada, and to freedom. The name arose from the exaggerated use of ay terms in reference to the conduct of the system. Levi n and Robert Purvis were the "presidents" of the road. ous routes were known as "lines," stopping places were called ions," those who aided along the stages of the route were luctors" and their charges were referred to as "packages" reight." The system reached from Kentucky and Virginia s Ohio, and from Maryland across Pennsylvania and New or New England. The Quakers of Pennsylvania perhaps ted the system; the best known of them Thomas Garrett 9–1871) is said to have helped 2,700 slaves to freedom. One e most picturesque conductors was Harriet Tubman, a negro an called "General" Tubman by John Brown, and "Moses" er fellow negroes, who made about a score of trips into the n, bringing out with her perhaps 300 negroes altogether. Levi n, a native of North Carolina, in 1826 settled at New Garden Fountain City), Ohio, where his home was the meeting of three "lines" from Kentucky. In 1847 he removed to innati, where he was even more successful in bringing out s. Estimates of the number of slaves who reached freedom ugh the system vary from 40,000 to 100,000.

W. H. Siebert, *The Underground Railroad* (1898), a scholarly containing maps of routes and bibliography. W. Still, *The rground Railroad* (1872), R. C. Smedley, *History of the Underd Railroad* (1883), and *Reminiscences of Levi Coffin* (1880) ersonal records of participants.

NDERWOOD, OSCAR WILDER (1862–1929), Americolitician, was born at Louisville, Ky., on May 6, 1862. He ed at the University of Virginia (1881–84), was admitted to ar in 1884, and practised law thereafter in Birmingham, Ala. n 1895 to 1915 he was a member from Alabama of the onal House of Representatives, and during his last two years man of the committee on ways and means. After the Dems came into power in 1913 he had a large share in framing ariff bill passed the same year. In 1914 he opposed the ma Canal Tolls Repeal bill, but supported the resolution prising the President to use armed force in Mexico. He was sed to the woman suffrage amendment to the Federal Conion, holding that the question was a state issue. He also sed the national prohibition amendment. In 1914 he was ed to the U.S. Senate, and in 1920 re-elected. In 1919 he ured the anti-strike clause of the Cummins railway bill. A g supporter of the Peace Treaty of Versailles, in Dec. 1919 fered a resolution in the Senate providing that the president e Senate should appoint a committee of 10 senators to work ome acceptable plan for adopting the Peace Treaty; but this blocked by Senator Lodge. In April 1920 he was chosen Demic leader in the Senate. He was a U.S. delegate at the ington Conference on the Limitation of Armaments which nbled in Nov. 1921. At the Democratic National Convention in New York city, June 1924, Senator Underwood was an ccessful candidate for the presidential nomination. In 1927 as made a member of the American delegation to the Panican Congress. He published *Changing Sands of Party ics* (1927). He died at Woodlawn, Va., on Jan. 25, 1929.

NDERWRITING: *see* INSURANCE ARTICLES.

NDSET, SIGRID (1882–), Norwegian author, was at Kallundborg, Denmark, on May 20, 1882. After completer studies at the Christiania Mercantile college, Mme. Undset entered a city office in 1899 and remained a clerk until 1909. She thus gained an intimate acquaintance with the empty and unenlivened existence of the girls with whom she came into contact, and utilized her experience in her first literary works, initiated in 1907 by *Fru Marta Oulie*. In 1912 she achieved fame by the great Christiania novel, *Jenny* (Eng. trans., 1920), remarkable for its courageous treatment of the erotic problem. After revealing in one of her minor works (1919) the religious crisis in her mind which in 1925 caused her to join the Roman Catholic Church, Mme. Undset published *Kristin Lavransdatter* (1920–22); Eng. trans., Pt. I. *The Garland* (1922), Pt. II. *The Mistress of Husaby* (1925), Pt. III. *The Cross* (1927), a remarkable novel of the 14th century, by which she became known to the English-speaking world. Mme. Undset's work shows psychological depth and an ability to appraise the mind and temper of bygone ages, but these qualities are nowhere enlivened by a sense of humour. Her work, *Olav Audunsson*, a 13th century novel (1925), Eng. trans., *The Axe* (1928), is stamped by the same qualities. Another work *The Snake-Pit* was published in Jan. 1929. She was awarded the Nobel prize in 1928.

See J. Bing, *Sigrid Undset* (1924).

UNEARNED INCREMENT, in economics, a term frequently applied to that part of the value of land which is due to the growth and development of the community using it, to the construction of buildings, roads, railways, canals, docks, harbours, upon it, or to the working of minerals beneath it. Thus a piece of land in one part of a country, although beautiful or fertile, may be worth very little, while in another part of the same country a piece of land of similar area required for a railway, or by a railway made accessible for residential purposes, may rise in value by a hundredfold or a thousandfold. The gains thus made by some landowners are so obvious and so great that the specific taxation of the unearned increment has been often proposed and in some countries carried into effect (*see* article on LAND TAXES). Amongst others, John Stuart Mill favoured a progressive tax on land. Henry George's tax amounted to a proposal to absorb the whole of the surplus value (*see* SINGLE TAX).

UNEMPLOYMENT. If every able-bodied man and woman were regarded as an actual or potential worker, the term unemployment would have a larger meaning than is commonly accorded to it. For it would include the withheld productive time and energy of those who figure in censuses as "unoccupied," the upper and the lower leisured classes, all who manage to live without doing work. But though such a connotation might be sound and serviceable in a general assessment of national economic waste, it would carry us too far away from the set of actual problems conventionally and conveniently grouped under the term "Unemployment." That term covers the idleness of those willing and able to work which is attributable to the conditions of the trade or occupation in which they are ordinarily engaged.

Thus defined, unemployment, however, may not be equivalent to waste of productive time on the part of all "unemployed." For there are occupations that are essentially or "naturally" irregular in the volume of work they require. Such are those dependent upon climatic conditions, or seasonal requirements. Agriculture, building, fishing, dock labour, are important examples. Most of the slackness in such trades is in winter, though there are trades, mining for instance, where employment is slacker in summer. Fluctuations, as with some other trades, for instance printing and dressmaking, where seasonal activities are less directly traceable to climatic causes, run a fairly regular and calculable course. This regularity, indeed, permits of a certain amount of inter-trade adjustment which lessens the amount of wasted time. In some countries, as in Belgium and Russia, where the ties between country and town life are closer than in England, agricultural work sensibly relieves the unemployment in town industries. In a highly specialized industrial system, however, the possibilities of such adjustments are severely limited, and trade union discipline raises obstacles.

Reasons for Unemployment.—There are two other important sources of unemployment in particular trades, that cause trouble by their irregularity and incalculability. They are changes

of fashion or taste in the consumer, and inventions or new processes on the productive side of industry. The dressmaking and to a less extent the textile trades are peculiarly prone to sudden violent changes of fashion, while in most luxury trades considerable fluctuations of employment occur from the freaks of taste, often stimulated from the selling side. New materials, new combinations, shapes and colours, rapidly acquire prestige and shift the currents of employment. It may, of course, be urged that no net increase of unemployment is thus caused, for the new fashion yields as much employment as the old. But from the social standpoint considerable net waste ensues from such violent fluctuations.

Inventions, involving important changes of technique, especially in labour-saving machinery, are liable to cancel much manual skill, though they may indirectly increase employment by reducing costs and prices, so stimulating demand. If industry is in general active, workers thus displaced may not remain long unemployed, but in normal times, still more in depressed, they will encounter much difficulty in fitting themselves into a new post.

It is true, as Mr. Charles Booth stated, that "our modern system of industry will not work without some unemployed margin, some reserve of labour." But this margin need not be as wide as it is. More mobility of occupation, inter-local and inter-occupational, should be practicable. Better information through employment bureaux and trade union organizations can speed up adjustments, and so help to reduce the percentage of the population at any moment unemployed. But the efficacy of such measures depends largely upon those wider conditions of general trade, which are commonly brought together under the term cyclical fluctuations.

I. CYCLICAL FLUCTUATIONS

The Measure of Unemployment.—It will be convenient, first, to consider briefly how far we are able to measure unemployment. There are two sources of information in Britain, the trade union returns of members out of employment (whether in receipt of unemployed benefit or not) and the returns covered by the Unemployment Insurance acts. Up to 1920 the trade union returns were the largest statistical basis. They were, and are, a very incomplete index of the total volume of unemployment. For the trade unionists included in the returns are usually less than half of the trade unionists in the country, and the latter are only from a third to a half of the wage-earning classes. Although it is part of the policy of trade unions to secure for their members a preference in employment, it is likely that the proportion of unemployed among industrial workers who are non-unionists is rather less than among unionists. For the trade unions are strongly represented in certain trades which are exceedingly liable to trade fluctuations, such as the building, mining, engineering, metal and ship-building trades. Moreover, a trade unionist is far less likely to seek employment in some other trade than his own, or to accept lower wages in his own trade. On the other hand, the great mass of casual labour will bring up the volume of unemployment in the low-organized trades.

These considerations serve to indicate that the returns under the Unemployment Insurance act of 1911, extended in 1922 to cover some 11,500,000 manual workers, form a better index of the total amount of unemployment. The only large classes excluded are domestic servants, farm labourers and government employees. These classes, however, are so large and, with the exception of sections of farm labourers, so much more regular in their employment, as to cause some exaggeration to appear, if the insurance statistics are taken as a measure of the unemployment of the working population in the aggregate. When the official figure for unemployment is 10%, the average unemployment for the workers as an aggregate might perhaps be put at 9% or even less. As an offset, however, against such a tendency to overestimate, the habit of resorting to short time to meet trade slackness must be taken into account. In coal-mining and the textile trades, especially cotton, this practice must considerably reduce the amount of reputed unemployment. At the lowest depth of the depression in Britain, in June 1921, when 2,171,288 workers were applicants for benefit in respect of total unemployment, 832,340 workers claimed benefit for short time.

Cyclical Unemployment.—The minor leakages and fluctu tions due chiefly to natural causes, or to alterations in methods work, or of consumption, are so various and so numerous th they may be held to require a certain small percentage of "wa ers" as representing the wholesome elasticity of a free progre sive economic system. But can the same be said of the larg periodic movements known as trade depressions, which doom large percentage of the available productive capital and labo to stand idle for a couple of years or more? Are we to rega these large fluctuations as inevitable, or possibly desirable? Fir a word as to the size of these fluctuations. Before the World W the annual averages in Great Britain swung between about 2½ and 7½%, leaving an implication that our system, for its fre working, requires an average unemployed margin of some 5% half of it representing the minor trade changes and leakages which we have referred, half forming a reserve of labour to enab expansion to take place in good times. But war and post-w experience shows a far more violent fluctuation. For, where the figure for 1918 was 0·8 and for 1919 2·4, the depression whi set in at the close of 1920 reached by June 1921 the extraordina figure of 23·1%, and the trade union average for 1921 was 15 for 1922, 15·4%.

Two other general tendencies may be noted. The larger inte course between industrially developed countries since 1875 h made these ebbs and flows of trade more simultaneous. Th "boom" years 1873, 1874, 1900, were common to all industri nations, so was the collapse of later 1907. The other tendency the shortening of the cycle. Before the seventies of last centu there was something like a 10 years' rhythm. Since then t periods have shortened, the years of maximum trade activity bei 1873, 1882, 1890, 1900, 1907 and 1913. The post-war situatio caused some disturbance of both these tendencies. "Japan bega to feel the effect of trade depression in 1919 when trade in Gre Britain was in full swing. In 1921 Germany was expanding h industries rapidly, while Great Britain was in the throes of th depression. Again, in 1923 economic conditions in the Unite States showed a very striking recovery, and indeed she attained the spring a condition of record trade activity." (Hon. J. Astor, *Is Unemployment Inevitable?*, p. 11.)

The Post-war Depression.—Before discussing the causes a remedies of normal cyclical unemployment, it will be well to de briefly with the peculiarities of the post-war depression, whic alike in its causation and its character is abnormal. Witho prejudging the question of the part played by finance in ordina cycles, it is evident that the World War and post-war inflatio practised in different forms and measures by almost all Europea governments, and the consequent collapse of exchange and inte nal monetary values, were disturbing factors of prime importanc While inflation exercised an immediately stimulating influence o internal trade by encouraging expenditure, and upon export trad by means of an artificial cheapening of production, the consequen damages to confidence and credit, the ruin of large sections of th middle-classes, the difficulty of the import trade and the scarci and dearness of working capital, were main contributions to th long depression. Closely connected with this financial disease was the sabotage of commercial relations, accompanied by hig tariffs and embargoes upon the movement of goods and inves ments, and the breaking up of the economic unity of the Austro Hungarian empire. The virtual isolation of Russia from fre economic intercourse with the outside world brought a serious cu tailment of foods and raw materials for other countries, and corresponding reduction of manufacturing exports.

New difficulties arose between town and country, due to ba money, creating food shortages, depressed wages and efficienc among industrial workers. Political disturbances, accompanied b strikes and labour difficulties in most countries, were a factor i low production. More important in Britain and other ex-belliger ent industrial countries was the collapse of industries over-stimu lated for war-production whose excessive plant and labour coul not be adapted readily to useful work in the post-war world. Th huge depression in the iron and steel, engineering and ship-buildin

as in the mining, was largely attributable to this cause. etary disturbances, commercial obstacles, industrial dislocaevolutions and sporadic warfare thus contributed towards te depression unique in its character and distribution . as unprecedented in its magnitude and duration. These nt causes operated at different times and with different s in the various countries. In every country there was a coincidence between the fluctuations of prices and of ment. When prices fell unemployment rose, and vice The countries not directly implicated in the war suffered ent fluctuations as the ex-belligerent countries. The unment figure in each of the Scandinavian countries (with eption of Finland) was higher in the later part of 1921 opening of 1922 than the British highest figure. Switzeruched 25% in Jan. 1922 and Belgium 32·3% in May 1921. many and Austria inflation postponed the trouble until ry reform was carried out; then came reaction and wideunemployment. In general the internal monetary policy a more determinant part than the restriction of the export re-absorption of the fighting forces, political animosities, or any of the other disturbing factors of the post-war This would seem to apply even to Great Britain, where of the principal export trades have been the heaviest s. For "most of the trades in question are also essentially ers of capital goods which invariably suffer worst during ion, even though they produce for home consumption They are also the trades which were over-expanded during r and for the production of which there is now neither or foreign demand on the same scale as before" (*Unemnt*, 1920, 1923, p. 113: International Labour Office). though fresh light has thus been shed upon some aspects more normal economic life, especially upon its financial e war-origin of these phenomena disqualifies this depresom figuring as a safe study for those who seek to underhe more regular cyclical movements of industry.

I. THEORIES OF CYCLICAL UNEMPLOYMENT

Physical Theory.—For convenience the explanations of gin and causation of cyclical unemployment may be placed classes, not indeed mutually exclusive but presenting difaspects and starting points.

first may be termed the physical theory, dealing with the ological factor in trade fluctuation, which first came to ention of economists in the work of W. S. Jevons, who l to establish a connection of the appearance of sun vith climatic conditions affecting harvests, and thereby the tivity and purchasing power of the world. Though later omical records give no support to the sun-spot theory, ts have been made by H. S. Jevons and Sir W. H. dge to relate climatic variations with food supplies and trade. But though there is nothing inherently improbable correlations, the case presented in statistics is not con, even if allowance is made for what may be called accilags. The restricted scale of the crop-records, both as to nd kinds, the dubious reliability of the earlier records, the ation of various minor and major waves, the overlapping lies from year to year, especially in modern times, the limect which such crop variations as are shown could exercise e total industrial activity, deprive this class of explanation claim to more than a minor speculative interest.

variations in harvests, if they are considerable and wide- will exercise some influence upon industrial output, rt and employment, is undeniable. If foodstuffs and raw ls are produced in diminished quantities at higher selling the processes which work them up, carry and distribute will be reduced in the employment they afford, not, howecessarily to an extent corresponding with the crop-shortage. fect will be greater when trade is very active than when and over-stocked. The argument, often stressed, that in asons the agricultural classes, having less spending power, duce their purchases of other goods and services, and so depression, cannot be accepted without qualifications. If it were true, as is sometimes held (*e.g.*, Hull, *Industrial Depressions*, p. 45, etc.) that small crops often bring in as much money as big crops, the argument would of course collapse. But the varying elasticity of demand for different articles makes it pretty certain that a widespread bad harvest has some effect in reducing the purchasing power of the rural population. Moreover, the rise in food-prices will reduce the expenditure of the industrial classes upon other goods, causing a total shrinkage of demand that must affect employment. But having regard to better crop information, quicker and more reliable transport over wide areas, improved finance for stimulating, moving and marketing raw products, better instruments for storage and preservation, climatic causes ought to play a constantly diminishing part in cyclical fluctuations.

The Accidental Theory.—Under this head may be placed those who, discarding all general views of causation, impute trade depressions to a variety of unconnected occurrences, sometimes political, such as wars and revolutions; or natural, such as droughts or floods; or business, such as the collapse of active railroad enterprise; or financial, such as a banking crisis. Local troubles, thus brought about, spread by contagion or infection, until they have depressed the entire industry and commerce of large sections of the world. It is undeniable that one or more of such injurious occurrences, a bad monsoon, a war or revolution, a "Black Friday" or an Australian bank collapse, may play quite a distinguishable part in precipitating a crisis of trade and ushering in a period of depression. But most of these events belong to human conduct and are due to economic forces wider and longer in their operation than the catastrophic acts which figure as immediate causes of financial or industrial trouble. There is sufficient regularity in these cyclical fluctuations to enable us to dismiss as inadequate the view that regards them as pure accidents.

The Psychological Factor.—Business action is so dependent upon beliefs and feelings that some economists use language implying that industrial prosperity and depression are little else than reflections of a rhythmic movement of confidence and dejection in the minds of men. This psychological rhythm, operating upon industry through credit (the financial index of confidence) they regard not merely as an accompaniment and agent, but as the chief efficient cause of industrial fluctuations. Starting with the assumption that the business mind is by nature prone to these alternating elations and depressions, and that they are quickly and easily communicated by business leaders to the rank and file, the theory of independent psychological causation becomes plausible. In times of rising confidence business men seek to borrow freely from the banks, and the investing public to extend their profitable business operations. Bankers, sharing the confidence of their customers, make large advances upon reasonable terms at such times, and new capital is forthcoming to extend existing businesses and open new ones. This wave of confidence having spent its force in thus stimulating credit and industrial activity, begins to subside; credits are restricted or called in, because of a belief that trade is going down, and this belief and restriction are the means of reducing the volume of commerce and contracting business operations. This separate presentation of the psychological movement, however, is uncommon. The connection of these fears, hopes and illusions with "credit" is so close and obvious that it is here we must seek for the connection between the moral and material aspects of a cyclical fluctuation. If everyone bought with his own money alone, business operations, though more restricted and less productive, would be subject to smaller variations in volume and value. The worth of the credit and investment systems is that they permit the rapid seizure of opportunities for profitable expansion of industrial activity. The concrete productive forces of land, capital and labour are thus handled to greater advantage.

Courses of the Cycle.—How credit actually operates in the cyclical movement is best seen by following the general course which such a cycle takes. In tracing this course it is well to begin from the start of a trade revival. When a depression with low production, low prices, profits and employment, has continued for some time, the excessive stocks which, because they could not get sold fast enough, congested the wholesale markets at the

beginning of the depression and brought prices down, show signs of approaching depletion. It becomes evident that the current rate of production will soon be inadequate to meet the effective demand at the present low level of prices, and that, to stimulate production, prices are going to rise. Merchants handling wholesale trade are usually most sensitive to the situation, and are the first to take action. Anticipating an early expansion of sales at higher prices, they seek to make contracts with manufacturers and other producers for future delivery of materials and goods upon a larger scale. These producing firms seek to replenish their lowered stocks of raw materials, fuel, etc., to improve and enlarge their plant and to take on more labour. The fundamental and instrumental industries such as mining, iron and steel, engineering and shipbuilding, where depression and unemployment have been deepest, must set to work at once in order to make timely provision for the renewed activity in the later stages of production. Merchants, manufacturers and makers of instrumental capital must all seek the assistance of banks for the means of making these expansions. Since bank customers during a depression find a difficulty in getting safe or lucrative investments for their savings, bank deposits are swollen, and partly from this source, partly from the banks' own resources, the credit required, both for increased working capital by short loans, and for more permanent investment, is obtainable from the banks and the investing public.

The limits set upon such expansion are slow to appear. For, in the earlier stages of the process, the well-founded conviction of bankers that there is a genuine revival of trade which permits them with safety and profit to make advances to customers, and the possession of large unused cash reserves, seem to make liberal credits a good banking policy. Thus business men are able to go ahead with increased production, absorbing the capital and labour that had lain unemployed, and enlarging the volume of output and sales at prices which yield an increasing margin of profit. But, when the movement has gone a certain way, two things happen. As soon as the productive power of industry, especially in the great machine trades, has been in full play for a little time, merchants begin to realize that they can get quicker deliveries on easier terms than when the revival began, and as prices are still high and profits large, they become speculative holders of large supplies, applying to their banks for credit to assist them in this policy. The confidence which a genuine revival has inspired, and the belief that prices will go higher still, induce the banks to aid and abet what is in reality a speculative boom in which prices for a time may rise higher than the level to which the industrial boom has brought them. It is now generally recognized by financial experts that insufficient knowledge of actual trade conditions is largely responsible for carrying the cyclical wave of prices to an excessive height by this undue use of credit.

The other thing that happens is even more crucial in its consequences. In the revival of trade the rise of wages continually lags behind the rise of prices. This means high profits for traders, and no considerable risk for bankers with their large cash reserves. But when the revival has reached its height and prices remain fairly stable at a high level, wages creep up and the workers demand their share of the prosperity. This brings simultaneously a cut in profits, that in some measure weakens the borrowing power of the business man, and a reduction of the bank reserves of currency to meet the weekly demands of the higher wage-bills. As cash reserves are reduced, the banker takes alarm, and, following his customary policy, raises his rates, restricts further credit and calls in loans. This forces weaker business men to realize on their stocks, prices hurtle down, orders fall off, production slackens and unemployment sets in. The fall of prices, accompanied by a fall in profits and later on in wages, does not stimulate enough increase of demand to check the process of depression. So the circle comes round.

This presentation of the cycle tends to support the view that trade fluctuations are pre-eminently credit cycles, the efficient causation of the movement coming from the money side. There are those who hold that a stronger, clearer-sighted and more disinterested banking policy could stop altogether great trade fluctuations, except so far as they might be due to great natural or political interferences. If bankers, they argue, would rigoro check further emissions of credit to traders when industry reached its full activity with capital and labour fully emplo the speculative part of the boom with its rocketing of p would be stopped. Or if, again, they were more cautious in stricting credit later on when the tide was beginning to turn, collapse of prices and restriction of output which ensued m be avoided. A more judicious and public-spirited bank p might, at any rate, cut off the peak of the trade curve and m tain a large degree of stability of prices and production. prime cause of unemployment, according to this diagnosis, is inelasticity of the modern monetary system.

The Under-consumption Theory.—A fourth school thought fastens upon under-consumption, or the failure of sumption to keep full pace with the swelling current of pro tion, as the main efficient cause of unemployment. Their a ment runs thus: In any economic society, the current condi of the arts of production and standards of consumption determine, not only how much productive power of capital labour can be economically employed in the several processe industry and commerce required for turning out the different s of consumable goods in their due proportions, but also how m of the current income should be applied to taking out consum goods for consumption, and how much to stimulating the incr of productive capital in the various processes of industry. If little is expended in the latter way, *i.e.*, if savings are small, there will be an insufficient provision for a rising standar living for a larger population in the future. If too muc "saved" and too little "spent," there will come into being a la amount of productive capital in plant, tools, materials, etc., is required to turn out the consumable goods that get bought consumed. Though any individual, or group of people, may as large a proportion of their income as they like without in veniencing the economic system, economic society as a whol restricted in the proportion of the general income that can fully be saved by the condition of the arts of industry.

In a primitive society very little industrial capital can utilized: a modern industrial society affords a great scope saving and investment. But there is always a limit in the portion of income that can be economically utilized as new ital. If that limit were passed, too much capital being created the supply of the quantity of consumables that were purch for consumption, a stoppage of industry would take place, s of the industrial plants standing idle or half-used, with a gestion of unsaleable goods accumulated either earlier or late the processes of production. The actual over-production of sumables, or even capital goods, need not go far; the real chief will consist in the slowing down of the entire process of duction with a stoppage of the worse-equipped or worse-pla plants. As this productive plant slows down or stops, a co sponding body of unemployment is created. Real and money comes are thus reduced: profits, the main source of indus savings, shrink, most other business incomes fall, so that the portion of savings is let down for a time far below the true nor Spending does not fall proportionately, so that gradually the gestion of the economic machine is released, goods being ta out faster than they are being replaced. Weaker firms, during depression, have gone out of business, and little new plant been created.

When this double process of depleting stocks and letting d plant has gone so far that irreducible consumption is tendin exceed current production, prices begin to turn upwards; indication of an approaching revival of trade stimulates mercha and manufacturers to prepare for the revival. That prepara involves primarily a renewed activity in the fundamental instrumental industries, in order that more manufacturing pl and larger supplies of raw materials may be ready for the pansion in the later processes. The mining, metal, engineering transport trades, which depression had hit hardest, revive earl and fastest, for their increased output is a prior condition to activity in the manufacturing processes. For this process revival an expansion of bank credit and of currency is a necess

nent and adjunct, but the efficient causation of the move- oes not proceed therefrom.

riant of this under-consumption theory attributes depres- an over-investment in the instrumental and constructional ies, due to an over-estimation of the intensity of future which, operating in the immediate interests of the business restricts consumption by putting an excessive proportion luctive power into industries the consumable fruits of which g delayed and cannot in fact justify the amount of pro- energy directed into them. The position is thus stated Denis Robertson:—

each new investment, once it is made, will be capable of ing for a considerable period, the rise in the utility of new ctive goods will often in any case only be temporary; a point reached beyond which any further investment would involve ice of present enjoyment disproportionate to the enjoyment will be afforded by the new consumable goods which it is pro- o create. In fact, however, owing to the stress of competition, ted by the length of time which must elapse before the new ents projected can be brought into working order, investment y to be carried beyond this point. (*Study of Industrial tions*, p. 240–1.)

view, that an opposition of interests exists between the ng classes on the one hand and the working-class con- on the other, is reinforced by the writings of Mr. Veblen pecially *The Engineers and the Price System*), who charges rmer with practising a sabotage of industry, by chronic ion of productivity and output in order to make larger out of regulated prices.

r-population Theory.—Neo-Malthusians often explain loyment as a necessary implication of the tendency of popu- n certain countries, or in the world, to increase faster than ans of subsistence, or the growth of the fund of capital re- for their employment under modern industry. From the tion that a given area can only support a limited popula- employment upon such a standard of living as is required ain a family, they argue that in many countries the limit en passed, and that though there may be other areas of bearing larger populations than exist at present, the r from over-peopled to under-peopled areas is so much d as to leave in the former a considerable surplus over the economic requirements of the labour market. Though for in certain favoured lands, the pressure of the law of dimin- eturns to agriculture may be offset by high productivity of cture, the surplus of which may be used to purchase in- g supplies of foods and raw materials from newly developed he difficulties of this economy increase as the more fruitful backward countries advance in population and in the ment of their own industries.

eover, the restrictions of tariffs on the one hand, and gration on the other, make the natural adjustments more . The World War not only stopped the normal emigration ch congested European countries relieved themselves, but ted the erection of new barriers, especially by checking of European labour into the United States. On the other he losses of the war and the lower birth-rate and reduced of population signify a considerable reduction in the s entering the labour-market in these countries, especially when the full force of the lower birth-rate is represented numbers. So far as a reduced population carries with it a distribution of income, through higher wages, it may, in nce with the under-consumption theory, stimulate a volume of demand and more employment. But statistics sustain the view that comparatively sparsely peopled es like the United States, Canada and Australia, escape of unemployment as large proportionately as those of peopled Europe. While, therefore, the world volume of ment is evidently increased by mobility of labour, as of from one country to another, retardation of migration be regarded as a major cause of cyclical depressions and oyment.

III. REMEDIAL MEASURES

mercial Organization.—The remedies for unemploy- f course, vary with the different theories of the causation of the trouble. Orthodox economists, attributing it to a combination of unpredictable natural causes and business miscalculations, chiefly rely upon improved organization of markets, communications and finance, to reduce and alleviate the fluctuations. Even the natural causes can be considerably abated by increasing the dispersed sources of supply, and by better crop hygiene. But their main remedies are fuller and more reliable statistics, better business education, publicity of trade information, sound banking, with its steadying effect upon the minds and methods of business men, and, finally, the more controversial proposition of a willingness of organized labour to assist the recovery of trade by accepting lower wages when prices and profits have fallen. Misapplications of productive power, with their attendant losses and stoppages, could thus be averted. Business men, investors and workers would have the fuller confidence and security which better understanding of all factors in the business situation gives. Planning would be improved, speculation would be more enlightened and greater stability of industry, prices and credit would exist. This view is stated in the following terms by Sir W. H. Beveridge (*Unemployment*, p. 193):—

Unemployment is a question not of the scale of industry but of its organization, not of the volume of the demand for labour but of its changes and fluctuations. The changes are of several types. Trades decay or are revolutionized by new machines. Through these changes particular parts of the labour supply get displaced. Unemployment arises through their difficulty in getting re-absorbed. The fluctuations, also, are of several types; some co-extensive with the economic life of the nation; some peculiar to certain trades; some purely local or individual. To meet these fluctuations—cyclical, seasonal and casual—there are required reserves of labour power. Unemployment arises as the idleness of these reserves between the epochs when they are called into action. The solution of the problem of unemployment must consist, therefore, partly in smoothing individual transitions, partly in diminishing the extent of the reserves required for fluctuation or their intervals of idleness, partly, when this plan can go no further, in seeing that the men of the reserve are properly maintained both in action and out of it. The problem is essentially one of business organization, of meeting without distress the changes and fluctuations without which industry is not and probably could not be carried on. It is not a problem of increasing the mere scale of industry. It is not a problem of securing a general balance between the growth of the demand for labour and the growth of the supply—for this general balance is already secured by economic forces—but one of perfecting the adjustment in detail.

Banking and Currency Control.—Those who hold trade cycles to be pre-eminently credit cycles seek remedies for depressions and unemployment in a more intelligent control of banking and currency. Since these fluctuations are brought about by price changes, the aim should be to stabilize prices, or at any rate to keep the fluctuations within narrow limits. If any economic events, affecting the supply of goods, tend to raise or lower prices, the supply of money should be increased or diminished so as to compensate for such disturbance. A depression in which capital and labour lay unemployed because prices were too low to cover costs of production should be met by emissions of credit which by raising prices would stimulate industry. These small doses of inflation would, it is contended, enable industry to absorb the unemployed capital and labour, by raising prices to a level which sufficed to yield reasonable rates of wages and profits. Then, when industry was brought into full activity, prices should be stabilized at that level, and a monetary policy devised to keep them stable. Some financial purists, objecting to the inflationary method, would wait for general trade causes to produce a revival and would then apply the stabilizing policy.

There are various methods advocated for stabilization. Some are based on the retention of the gold standard. The volume of currency could be expanded or contracted by increasing or reducing the quantity of gold in the unit of account. This is the essence of Professor Irving Fisher's proposal of a "compensated dollar." Others would follow an elastic policy of expansion or contraction, operated by a central bank in conjunction with the Government, whereby alterations in the discount rate should be fortified by a selling or purchase of public securities. Others, again, regarding a gold standard as a hampering factor in the situation, would regulate the quantity of credit and currency by exclusive attention to the demands of trade, at any rate for pur-

poses of intranational payments, gold being retained exclusively for purposes of international exchange pending the possible future development of a reliable federation of national banks pursuing an agreed international policy for the regulation of credit and currency. (*See* MONEY.)

Various critics of established monetary systems in recent years attribute depressions to the failure of the volume of purchasing power to correspond with the actual or potential volume of goods. All that could be produced could not get sold, because of the lack of money in the hands of would-be purchasers. This is sometimes attributed to the credit system, operated by the "money power," which by financing trade raises costs of production and selling prices to a height greater than the purchasing power distributed among the owners of the factors of production at the various stages. In this view, it is necessary for the State bank, or other money-makers, to provide a supplementary supply of purchasing power in order to furnish adequate markets for all the goods which the economic system could produce.

Taxation and Income.—Between the financial doctors and the under-consumptionists there is this common ground, that both find that the reason why goods cannot get produced in bad times is that there is an insufficiency of purchasing power in the hands of the consuming public to buy them at a price covering their costs. But most under-consumptionists attribute this insufficiency to a maldistribution of income. An insufficient proportion of the actual or possible income passes to the classes who would spend most, an excessive proportion to those who would save most. This, as we saw, leads to an attempt to put into concrete shape and activity a larger quantity of capital than can function productively in turning out the volume of consumable goods which can be taken out of the productive system to be consumed. Those who accept this diagnosis find the only valid remedy in measures for a better, or more equal, distribution of income. Measures of taxation, devised so as to take rents, excess profits, windfalls and other elements of income that are "surplus," in the sense that they do not evoke productive efforts from the recipient, and apply them economically to sound purposes of current public expenditure, make for this better distribution. So do political or non-political actions that raise the proportion which workers take in wages out of the general income of the country. Economists favourable to a socialist or labour policy generally hold that a sound test alike for preventives and remedies for unemployment is the absorption of "surplus" income in wages or in public revenue.

Palliative Measures.—The different views of the origin of unemployment affect the attitude of business men, politicians, workers and economists, towards the measures adopted in various countries for the alleviation of the burdens of actual unemployment upon the working classes and the community. Leakage between jobs and other minor wastes may be repaired by employment exchanges where out-of-works may apply for vacant posts. Quick, full and reliable information may here greatly help the mobility of labour. Trade unions, either working with employment exchanges, or on their own account, make it their business to find vacant jobs for their unemployed members. In Great Britain there existed at the close of 1924, 382 employment exchanges, 772 branch employment offices and 324 local employment committees, representing employers, workers and certain other bodies. Where trade conditions are largely of local determination, it may be possible for displaced workers to find a job in some other town or district, or even in some other country. Travelling money is provided by many unions, and in certain continental countries, as in pre-war Germany, relief stations are provided in order to enable unemployed workers to move about in search of work.

Another mode of stopping leakages is a decasualization policy, applied chiefly to certain classes of dock labour where the inherent irregularities of the trade are intensified by keeping an excessive reserve instead of tightening up the organization of the trade. Seasonal fluctuations may be similarly remedied by transference from one seasonal trade to another. This is probably applicable only to low-skilled work. "Building, with all the country occupations—harvesting, fruit picking, hopping—on the one hand and the gas-works, the docks and all the Christmas dema the post office and in shops on the other, offer ample terial for a start" (Beveridge, p. 210). Schools and juv employment exchanges can do much to help a better appo ment of young labour among the occupations. At the end of there were in Britain 140 juvenile advisory committees attach employment committees and 145 choice-of-employment mittees under local education authorities. Continued educ for unemployed boys and girls has made some progress the war in England, and a beginning has been made in technic vocational training as a contribution towards improved effic of labour and enlarged supply of skilled workers. In Ger vocational guidance has taken on great activity, the numb offices in 1924 being 597, of which two-thirds were working the employment exchanges.

The Ministry of Labour of Great Britain co-operates Dominion Governments in finding employment overseas willing emigrants, though the numbers thus placed are s There are difficulties on both sides, unemployed workers ferring to await the chance of work at home, and the Domi exercising a rigorous choice in the personnel of those they a Publicly organized relief works are a device for dealing unemployment widely adopted in Britain and other coun In England the unemployment grants committee was establ in Dec. 1920, to give financial aid to local authorities in exec "works of public utility designed to secure some measur relief in districts or in trades suffering from unemploym The committee operates partly by loans of public money, va from 50 to 75% of the capital costs of the undertaking, part grants amounting to 75% of the wage-bill for unemployed taken on. Most of the works thus encouraged were dock harbour extensions, gas, water and electric supply, roadma sewerage works, parks and recreation grounds, constructio public ferries. In addition to the employment directly afforde these works, an almost equal amount is provided in factories, for the production of the materials required. During the and a half years' working to June 1925 the estimated capital of the approved works was £85,123,371, and the total g were £68,434,280. The amount of employment thus provided estimated at 3,181,270 man-months. This policy has confo to the recommendations of the Minority Report of the Law Commission of 1907 in seeking to even out the volume of employment by allocating public expenditure as fa possible to periods of depression and unemployment.

Insurance Against Unemployment.—By far the mos fective provision for the unemployed is by insurance. This b when certain trade unions in Britain and Belgium, about middle of the 19th century, arranged to pay regular allowa to members out of work. This method of provision has grow various countries, and has been built into the public insur schemes of more recent times (*see* SOCIAL INSURANCE). T are various outstanding problems in the development of unemp ment insurance policy. The widest is concerned with the ques whether the basis of insurance should be general or indust The latter view is supported on the grounds that each industr best qualified to deal with its own risks, which, alike in size origin, differ from those of other industries. The former stresses the common needs of the unemployed, the difficulty more fluctuating trades would find in making adequate provi and the advantages of one instead of many administrative bo So far, in countries where compulsory insurance prevails, the eral tendency has been towards a single uniform administra though in the British case certain exceptions are admitted in 1920 act. Other difficulties arise as to the interpretation of "suitable employment" which an unemployed person may refuse, and of the term "involuntary unemployment" when a st or lock-out throws out of work members of other trades than directly affected. The Unemployment Insurance Act of 1927 vides that claimants to benefit may be asked to accept work occupations other than their own, under certain approved co tions. Other questions remain. How far should insurance c seasonal and short-time unemployment? A large issue rema

f the linking up or unification of unemployment with other
ng class risks in a joint insurance policy. (*See* TRADE CYCLE.)

EMPLOYMENT INSURANCE. The National Un-
yment Insurance scheme of Great Britain was instituted in
nder the National Insurance Act of 1911. Its main object
provide assistance during unemployment to contributors
d under the scheme.

or to 1912 there was no national or other system of com-
y insurance against unemployment. The need for providing
t the risk had, however, been recognised for some time
usly, and from the middle of the 19th century a number of
unions and friendly societies granted assistance from their
to their unemployed members. This was not, however, by
eans a general practice of the unions, for as recently as 1904,
mbers of workers covered by voluntary schemes barely ex-
d one million.

ile British trade unions were among the first to pay allow-
to members out of work, the use of public funds for this
se appears to have been first applied in Switzerland, where,
1893 onwards, a number of towns and cantons established
ary funds. In 1895 the first attempt to institute a com-
y system of insurance against unemployment was made
Gall, in Switzerland, but this scheme ceased operation
wo years. A more general and successful method was that
as the "Ghent system," under which municipalities and
local authorities supplemented from their local revenues the
s paid by trade unions or voluntary unemployment funds
ir members. This system of co-operation between the local
ities and the trade unions received most support in Belgium,
d and France. The Poor Law commission recommended in
he encouragement of the voluntary methods of the trade
and other societies by the addition to the benefits which
aid of a fixed amount from the State or municipality. Very
after this recommendation was made, however, the first
ent of the present national system of insurance against
loyment came into being. Part II. of the National Insurance
11, for the first time in any country, provided for a com-
y scheme of unemployment insurance on a national basis.

1911 Scheme.—This was admittedly experimental and
pplied to certain trades which were regarded as par-
ly subject to unemployment, viz., building, construction of
shipbuilding, mechanical engineering, iron founding, con-
on of vehicles and sawmilling. The number of workers in
rades covered by the scheme was rather over 2¼ millions.
rkers of the age of 16 and upwards were insured.

broad lines of the scheme of 1911 were that a fund called
employment fund should be created from contributions by
vers and employed in the insured trades and by the Ex-
r. Out of this fund a worker would be entitled, subject to
g stated conditions, to receive benefit in proportion to
ntributions he had paid, subject to a maximum period in
ear.

er the act of 1911 the contribution of employers and
s respectively was 2½d each. The joint contribution of
s paid in the first instance by the employer who was re-
to affix a special stamp to an unemployment book and was
ntitled to deduct 2½d from the worker's wages. Reduced
vere payable for workers below 18 years of age. The Ex-
r contributed a sum equal to one-third of the total receipts
mployers and employed. The total income from contribu-
or the year 1913–14, the only typical complete year before
the war, was about £2,400,000, of which employers and employed contributed about £900,000 each and the Exchequer about £600,000.

The rate of benefit in 1911 was 7s a week (with half-rate between 17 and 18 and nothing between 16 and 17). No distinction was made between men and women as regards rates of contributions or benefit. There were in fact very few females in the trades then insured. Benefit was not payable for the first week of unemployment, which was termed a waiting week. After that it might be drawn to the extent of one week of benefit for every five contributions paid and for a maximum of 15 weeks in a year.

The main conditions which an insured person had to fulfil before he could obtain benefit were that he should prove that he had worked in an insured trade in 26 weeks during the preceding five years; that he had applied for benefit in the prescribed manner and had since been continuously unemployed; that he was capable of work and unable to obtain suitable employment and that he had not exhausted his right to benefit. In addition to satisfying these conditions the applicant for benefit had to show that he was free from disqualifications—the chief of which were the loss of employment through a stoppage of work due to a trade dispute at his place of employment or through misconduct or voluntarily leaving work. The only material alteration made prior to 1920 in the statutory conditions for the receipt of benefit was that instead of having to prove employment in an insured trade for 26 weeks during the preceding five years, an applicant had to show that he had had ten contributions to the scheme paid in respect of him.

The question whether or not benefit was payable to an insured person was decided under a special machinery set up to deal with applications expeditiously. The decision was given in the first instance by an officer called an insurance officer, and if adverse to the claimant was subject to appeal by him, or by an association of which he was a member, to a court of referees consisting of an employer, a workman and an impartial chairman. Beyond this tribunal there was the possibility of further reference to an umpire appointed by the crown. This machinery maintains to-day, although for a time it was supplemented by another procedure which is mentioned later.

There were two provisions in the act of 1911 which may be described as encouragements to voluntary systems of unemployment assistance. The first permitted an association of workers in the insured trades which paid allowances to its members when unemployed to administer for those members the benefits payable under the act from the State scheme. The other provided for the repayment to associations of workpeople, whether in the insured trades or not, of a proportion (one-sixth) of their expenditure on out of work allowances to their members.

Two other supplementary provisions of the 1911 act may be mentioned. One was intended as an encouragement of regularity of employment. If an employer kept a workman in his employ continuously during a year and paid at least 45 contributions in respect of him, he might obtain a refund of one-third of his own share of the contributions. The other provision enabled a refund of contributions to be made with compound interest, to a workman who had attained the age of 60 and had paid 500 contributions, subject to the deduction of any benefit he had received since his entry into insurance.

These were the main lines of the scheme embodied in the act of 1911. Benefit could not be drawn as soon as work was lost, there must be a waiting period, it could only be drawn for a limited time and it was not at a subsistence level—it was, and was intended to be, an aid to the insured contributor's own thrift by supplementing his savings or voluntary insurance. In these matters the compulsory national scheme followed the voluntary methods of the trade unions and also avoided many of the dangers inherent in a more generous scheme.

Contributions first became payable in July 1912 and benefit became payable as from January 1913. Very little experience, therefore, had been gained of the working of the scheme before the World War put an entirely different complexion on the industrial situation and the need for a scheme of the kind. The two

years from July 1912 to July 1914 were years of good trade, and there was no opportunity to test the soundness of the assumptions and calculations upon which the scheme had been based.

The scheme was in the beginning administered by the Board of Trade and later by the Ministry of Labour through the machinery of what were first called the labour exchanges and later the employment exchanges. This was a natural, indeed an essential arrangement since it is of the utmost importance that the administration should be in a position to test the genuineness of claims by the offer of suitable employment whenever possible. A system of employment agencies was therefore a vital part of the scheme of unemployment insurance.

A proportion, one-tenth, of the income of the fund was to be applied to the cost of administering the scheme. While the rates of contribution were low a part of this cost fell upon the Exchequer, but when, under later acts, the rates increased considerably the appropriation thus made from the fund was sufficient to meet the cost of administration in most years.

During the World War, employment in the insured trades was good, and while the collection of contributions went on, very little benefit was paid under the scheme. The result was a succession of surpluses of income over expenditure down to the end of the war. In 1916 an act was passed which brought into insurance for a period of five years or until three years after the end of the war, whichever was longer, certain additional trades and all munition workers not already insured. The chief trades brought in were the metal, chemical, rubber, leather and ammunition trades. Thus the total number covered by the insurance scheme at the end of 1916 was about 3¾ millions, of whom about 1 million were females. These workers were brought into the scheme because it was anticipated that there would be considerable unemployment amongst them on the cessation of hostilities. No changes were made in the rates of contributions or benefit or in the general conditions.

The Out of Work Donation.—It is necessary to mention here as a step towards the development of the national system of unemployment insurance, the scheme of "out-of-work donation" which was instituted to cope with the serious unemployment which ensued on the termination of hostilities in Nov. 1918 both amongst ex-service men and women returning to civil life and the non-service population who had to turn over from war-time to peace occupations. This was, however, no part of the then existent unemployment insurance scheme—indeed it took the place of that scheme for some time.

The rate of donation payable under this scheme varied from 29s to 20s a week for men, and from 25s to 15s a week for women with supplementary donation of 6s a week for the first dependent child and 3s a week for each additional child. Civilians were allowed up to 26 weeks of donation during the twelve months for which the scheme applied to them, while ex-service men and women were allowed up to 89 weeks of donation if unemployed for so long, within the period from Nov. 1918 to March 1921, for which their policies were available. Upwards of £40,000,000 was paid under the scheme to ex-service men and women and upwards of £21,000,000 to civilians. *No part of this money came from the unemployment insurance scheme.* It was all provided by vote of parliament.

During and immediately after the war the subject of unemployment insurance was examined by a number of committees, all of which reported in favour of the extension of the scheme. The institution of the out-of-work donation scheme and the need for awaiting the resettlement of industry into its peace time occupations postponed for a time the extension that was generally anticipated and desired, but in Dec. 1919 a bill for this purpose was introduced and was passed into law in Aug. 1920.

The Act of 1920.—The Unemployment Insurance Act, 1920, repealed all earlier enactments and is still (1929) the principal act under which the scheme operates. It came into force on Nov. 8, 1920 and brought into insurance an additional eight million persons, making with those insured under the earlier acts, a total of about 11¾ million persons insured against the risk of unemployment. The scheme as extended by the act of 1920 applies to all persons of 16 years of age and upward employed under a contr of service or apprenticeship (except apprentices without a mo payment), save those in certain excepted employments, the ch of which are agriculture and private domestic service. The perm nent employees of Government departments, local authoriti railways and general utility companies may also be excepted. N manual workers in receipt of remuneration exceeding £250 year are also excepted. Contributions cease to be payable by employed person, and he ceases to be entitled to benefit, on rea ing the age of 65, but the employer remains liable for his sh of the contributions. No material change has been made in scope of the scheme since 1920, save that workers in the Fr Free State and in Northern Ireland are now covered by schem of their own.

Exemption from the scheme may be obtained by persons receipt of any pension or independent income of £26 a year more and by persons ordinarily and mainly dependent for th livelihood on some other person or in an uninsurable occupati An exempt person is not himself liable to contribute to the sche but his employer remains liable for the employer's share. B in this case and in that of the person over 65 the reason for quiring payment of the employer's share of the contribution is t there shall not be any premium or inducement to employ exempt rather than an insurable person. The number of exer tions current is rather under 30,000.

The main features of the scheme as launched in 1911 were tained in the greatly extended scheme of 1920. Contributions w levied on the same three parties, viz., employer, employed and Exchequer, and, as the scheme was introduced to parliament, shares of each party were to be in the same proportion as in 19 Owing, however, to changes made during the passage of the changes which increased the cost of the scheme, the contributi of employer and employed were increased and, instead of be as intended, in the case of adult male contributors, 3d from ployer, 3d from employed, and 2d from the Exchequer, amounts became 4d, 4d and 2d respectively. Thus, instead paying one-fourth of the total contribution, the Exchequer one-fifth. Benefit was payable in proportion to the number contributions previously made and subject to a maximum of weeks in a year—again as in 1911, but instead of one week benefit for every five contributions, the rule was one wee benefit for six contributions, hence the "1 in 6 rule." The wee rate of benefit was increased. In 1911 it was 7s a week for m and women alike. This had been raised in Dec. 1919 to 11 week. The act of 1920, following the precedent of the out-of-w donation scheme, prescribed different rates for men and wom respectively, the former being entitled to 15s and the latter to Boys of 16 to 18 received 7s. 6d. and girls of the same age a week.

The "waiting period," for which benefit is not paid at beginning of a spell of unemployment, was retained, but it reduced from six days to three days. This was the most co alteration made during the passage of the bill through parliam and was largely responsible for the increase in the contributi The earlier days of unemployment are necessarily the most pensive in any scheme of unemployment insurance, since m more people are unemployed for one day than for two, for days than for three, and so on. Therefore, not only would m more persons become entitled to benefit although they were employed for only four, five or six days than would be enti to it if the minimum period to qualify were seven days, but th who were unemployed for more than six days would become titled to three days more.

Statistical Basis of the Scheme.—Upon the data avail when the act was being framed it was assumed that over a pe or cycle of good, bad and average years of trade the rate of employment among workers in the trades to be insured wo be 4%. The act of 1920 contained, as explained later, visions enabling industries to contract out of the general sche It was estimated that after allowing for the withdrawal of th industries that might be expected to contract out the indust that remained in the general scheme would have an unempl

experience of 5·32% over a cycle. It was upon this basis ne finance of the scheme was founded. As will appear, there far (1928) been no opportunity to test the soundness of sumptions as to the rates of unemployment or of the finan- asis of the scheme as passed, and having regard to the very al alterations in the contributions and benefits which have been made no test is now practicable. The conditions and lifications for benefit were almost identical with those the act of 1911 and need not, therefore, be repeated. The nery of adjudication upon claims, viz., the insurance officer, of referees, and the umpire, was maintained.

act of 1920 contained two provisions for enabling persons would not otherwise have been qualified to draw benefit the scheme. The first was of a permanent character and the effect that men discharged from the Forces should be a free credit of contributions to enable them to receive up maximum period payable during twelve months; this was 15 weeks, and later 26 weeks in a year. The other special ing condition was temporary. It was, that during the first months of the scheme benefit might be paid up to a max- of eight weeks as soon as an insured person had paid four outions. This was to provide for the unemployment of new nts who would have had no opportunity to satisfy the normal statutory condition, viz., the payment of twelve contribu- Even this relaxation of the normal condition did not prove ute to meet the situation which arose. The act of 1920 be- operate just when the severe industrial depression which ice continued first began to affect employment. Many per- who normally would have been at work and paying con- ons found themselves unemployed without having paid cessary qualifying number of contributions. To meet this n a short act was passed enabling eight weeks of benefit paid to persons who had been engaged in insurable employ- during ten weeks since Dec. 1919 or during four weeks July 1920. Even this proved insufficient, as will be shown. right of employers to receive a refund of a part of the outions paid in respect of workmen in their regular employ- was not continued, but the practice of refunding to work- eir share of the contributions paid in respect of them less enefit they had received, was retained. This right of the en was, however, abolished in 1924.

mportant new feature was included in the extended scheme o. Power was given to an industry to set up a special e of unemployment insurance for itself and so contract out general scheme. Such a scheme when approved had statu- orce and effect and was binding on all employers and workers industry. The chief conditions which applied to a special , were that it must cover all persons employed in the y, the benefits must be, on the whole, not less favourable hose provided under the general scheme; the State con- on would be on a reduced scale; and the scheme would be stered, not by a government department, but by a joint f employers and employed in the industry. The object of ovision was, no doubt, to sweeten the pill of compulsion allow those industries which had low rates of unemploy- o set up schemes of their own, which they could ad- r on lines which would be more suited to their particular han those of the general scheme, framed as it necessarily meet the general requirements and conditions of industry hole.

as expected that several industries with low rates of em- nt would contract out of the general scheme and a number d to do so. The severe trade depression which began in umn of 1920, however, changed the position so materially ecial schemes became financially impracticable for most industries. In the result only two industries succeeded in special schemes, viz., the insurance and banking in- . The power of contracting out was suspended as from 21 and was abolished by the act of 1927. The present posi- erefore, is that no further contracting out by industries ible. The State contribution to special schemes was ed by the act of 1924; the two existing schemes are there- fore entirely dependent on contributions paid by the industries themselves.

Another new feature of the extended scheme of 1920 was the power given to an industry to set up a supplementary scheme for the benefit of workers in the industry, instead of contracting out of the general scheme. Such a supplementary scheme might provide for higher rates of benefit, for benefit during partial employment as well as unemployment and for benefit during periods when it was not payable under the general scheme, *e.g.*, during the waiting period. Advantage has not been taken of this provision by any industry.

Put shortly, the scheme as extended by the act of 1920 covered practically the whole of the working population which was subject to any considerable risk of unemployment. It brought into part- nership in the scheme the employer, the employed and the State, and by means of a moderate contribution from each of them created a fund from which reasonable benefits would be paid to unemployed insured persons in proportion to the contributions they had made when in employment. While there were what may be called trimmings, this was the effect of the main provisions of the act of 1920.

Fourteen Acts (1920–1927).—Since the principal act of 1920, no less than 14 acts of parliament were passed down to the end of 1927 dealing with unemployment insurance, while contributions under the scheme were dealt with in two other measures. The need for this mass of legislation lies in the wholly exceptional trade depression which began in the autumn of 1920, just when the scheme commenced, and has continued ever since (1928). These several acts have had one main purpose, viz., to enable benefit to be paid to those persons normally employed in the insured trades who were unable to satisfy the usual requirement of the prior payment of contributions.

Under the act of 1920 an insured person who satisfied the conditions and was free from disqualification, was entitled as of right to receive benefit in proportion to his contributions. This may be described as the covenant between himself and the scheme. The legislation which followed the principal act brought into existence a system of additional benefit which was first called "uncov- enanted" and later "extended" benefit which, except for the period from Aug. 1924 to Aug. 1925, was not drawn as of right, but only if, in the opinion of the Minister of Labour, as the minister responsible for the administration of the scheme, it was expedient in the public interest to allow benefit in any individual case.

Uncovenanted Benefit.—Persons who desired to obtain the advantage of this extended system of benefits although they had exhausted all their contributory rights, or even although they had paid no contributions at all, were required not only to fulfil all the usual conditions for covenanted benefit (except those relating to contributions), but also to satisfy certain additional conditions. These extra conditions varied somewhat from time to time, but in the main they required the claimant to show that he was normally employed in an insured trade, that he had done what, in the cir- cumstances of his case, could be regarded as a reasonable amount of work in a recent period, and that he was making every reason- able effort to obtain work suited to his capacities.

The various measures dealing with uncovenanted benefit pro- ceeded for some time on the basis of allowing it to be drawn for a stated number of weeks during certain periods which were termed "special periods." It was found that the provision so made did not meet the needs of the case and that many insured persons who were genuinely unemployed were obliged to apply to the poor law authorities for relief, during the intervals, or "gaps" as they were termed, between the periods for which benefit was payable. From time to time the number of weeks for which benefit might be drawn during the "special periods" was extended and increased and the "gaps" were reduced in length and finally abolished.

The additional conditions which had to be fulfilled by recipients of extended benefit were in general of such a character that they did not readily lend themselves to precise adjudication or deter- mination by the authorities set up to give decisions on the normal conditions. Partly for this reason, partly in order to ease the burden which would otherwise have fallen on the ordinary machin-

ery, the work of advising whether or not extended benefit should be allowed in individual cases was given to the local employment committees, bodies which had been appointed by the Ministry of Labour to advise him on the employment position in the areas of the employment exchanges and generally on the work of the exchanges.

These committees were representative of the employers and employed in each district and had additional members nominated by other bodies such as boards of guardians and ex-service men's associations. The committees, in view of the magnitude of their task, co-opted a number of local persons to act as rota committees for the purpose of dealing only with claimants to extended benefit. These committees over the period from 1921 to April 1928, when their functions in regard to extended benefit ceased, have rendered a great service to the community.

As a further means of meeting the need for exceptional assistance to the unemployed a measure which, in its title, was described as a "temporary provision," was passed in Nov. 1921, by which an insured person in receipt of unemployment benefit became entitled to receive in addition 5s. a week for his dependent wife and 1s a week for each dependent child. This act was intended to operate for six months only, but the provision made under it for adult and juvenile dependants was made part of the general unemployment insurance scheme early in 1922. The classes of persons in respect of whom the 5s allowance might be paid were also extended and the rate for children was increased to 2s. a week.

Cost of the Depression.—In order to meet the increased expenditure due to the long continued depression and to the grant of extended and dependants' benefit the contributions of all three parties—employers, employed and the Exchequer—were raised and power was given to borrow up to £30,000,000. The contribution in respect of a man became 2s. 1¾d, borne as to 10d by the employer, as to 9d by the employed and as to 6¾d. by the Exchequer. This was, later, reduced to 1s. 9d., the three parties paying 8d, 7d, and 6d respectively. There have been variations also in the rates of benefit. Starting in 1920 with 15s for men and 12s for women these rates were raised to 20s and 16s respectively in March 1921, but were reduced to 15s and 12s again from the end of June 1921. As from Aug. 1924 they were again increased to 18s for men and 15s for women. The changes in rates under the act of 1927 are mentioned later.

It is right to say that the various acts of parliament passed from the end of 1920 to 1926 inclusive were all regarded as emergency measures and that the extended benefit paid under them has been regarded as paid in advance of future contributions. No separate account has been kept of the cost of extended benefit but for some time before April 1928 probably more than half the persons in receipt of benefit were drawing extended benefit. The amount of the debt has varied considerably. The borrowing power was first exercised in July 1921. By the end of the year the debt was £7,000,000. It reached £17,060,000 in March 1923, but fell to £5,000,000 in 1924. It rose again to nearly £25,000,000 in March 1927 largely in consequence of the severe unemployment due to the coal dispute which lasted for six months or more in 1926.

During 1925 and 1926 the whole subject of unemployment insurance was examined by a committee under the chairmanship of Lord Blanesburgh. They made a number of important recommendations for the amendment of the scheme with a view to putting it on a sound and permanent basis. In particular they advised the abolition of the dual benefit system, *i.e.*, the concurrent existence of standard and extended benefit. The recommendations of the committee were accepted in principle by the Government, and with one main exception were passed into law by the Unemployment Insurance Act of 1927. That act made a number of changes in the scheme, dealing amongst other matters with the rates and conditions of benefit, the creation of a class of young persons between 18 and 21 years of age, the abolition of extended benefit and of contracting out. The present position is that from April 1928 there has been only one kind of benefit, the grant of which has not been subject to ministerial discretion based upon recommendation of local rota committees, but to determination by the normal machinery of insurance officer, cou of referees and umpire.

The governing condition of the scheme as amended by the of 1927 is the payment by the claimant for benefit of 30 contri tions during the two years preceding the claim. During a tra tional period which will end in individual cases between A 1929 and April 1930 this condition is relaxed in favour of cla ants who can prove that they satisfy an easier contribution t that they normally work in an insured trade and that they h done such an amount of work in the last two years as is reas able in the circumstances of the case.

The Scheme in 1928.—As a result of this legislation and s ject to the relaxation mentioned above during the transitio period, the broad outlines of the scheme as it was in 1928 may stated as follows:

(1) With certain exceptions, the scheme applies to workers o 16 years of age in all industries save agriculture and private dome service; the insurance and banking industries have separate spe schemes of their own.

(2) Contributions are payable by employers, employed and Exchequer, the rates for an adult male being at present 8d, 7d and respectively; lower rates apply to women and young persons.

(3) Benefit is payable at the following weekly rates:

Unemployment Insurance Benefits

	Males	Femal
Persons of 21 years and over	17s.	15s.
,, ,, 20 ,, of age	14s.	12s.
,, ,, 19 ,, ,,	12s.	10s.
,, ,, 18 ,, ,, ,,	10s.	8s.
,, ,, 16 and 17 years of age	6s.	5s.

(4) Benefit is payable in respect of an adult dependant at rate of 7s a week and for dependent children up to 14 years of (and exceptionally up to 16 years of age) at the rate of 2s. a we

(5) No benefit is paid for the first week of unemployment.

(6) The principal conditions for the receipt of benefit are:

(a) The payment of 30 contributions during the last years;

(b) Making a claim for benefit and proving continu unemployment;

(c) Being capable of and available for work;

(d) Genuinely seeking work and being unable to obtain s able employment.

(7) Benefit is not limited in proportion to the number of con butions previously paid, nor is it restricted to a given number weeks in a period, but after thirteen weeks have been drawn i period of six months the claim is referred to a court of referees review; moreover the "30 contributions rule" has to be satisfied the commencement of each quarter.

(8) A claimant is disqualified for benefit if he loses his empl ment by reason of a stoppage of work due to a trade dispute his place of employment or if he has left his employment voluntar without just cause or been dismissed for misconduct.

(9) Benefits may be administered by Associations on behalf their members.

(10) Industries may set up supplementary schemes, but may contract out.

The principal matter on which the act of 1927 did not fol the recommendations of Lord Blanesburgh's committee was regard to the proportions in which contributions should be m by the three contributing parties. The committee urged that b benefits and contributions under the scheme should be moder in amount, and upon the advice they received as to the degree unemployment which might be anticipated over a period of ye viz, six %, they stated that the total contribution required be levied in the case of a man in order to provide the bene they recommended was 1s. 3d. a week. This, the committee s should be paid in equal shares by employer, employed and State, and in order to liquidate the debt with which they ant pated their new scheme would start, they suggested an e 1d. a week from each of the three parties, the extra 3d. t raised being earmarked for debt extinction. Instead, howe the act of 1927 fixed the contribution for a man at 1s. 9d. stead of 1s. 6d. without any part of it being specifically set a for debt repayment. It is, however, provided that when scheme achieves a condition of solvency the contributions of three parties shall be approximately equal.

reception which was given to the report of Lord Blanes- committee and the legislation which followed it may e said to give a clear indication that a national compulsory of unemployment insurance on a contributory basis is nerally accepted as part of the social code of Great Britain. cceptance is, however, no doubt conditioned in several In particular it may probably be asserted with confidence ublic opinion would not tolerate a scheme which was so is in its cash benefits as to constitute a real incentive to s and so be a serious menace to the basis of society, nor, ly, would a scheme to which insured persons did not con- find general acceptance.

general feeling in favour of a national scheme is no largely due to the realisation that the scheme, as it has since 1920, has enabled the country to surmount many ious post-war difficulties with a minimum of economic dis- e and an undoubted relief to national and local taxation an, to some extent at least be measured by the cost to the uer of the out-of-work donation scheme.

ipts and Payments.—The following table gives in a sum- l form the receipts and payments of the scheme from its extension in Nov. 1920 to Dec. 31, 1927:—

Receipts

ce of 1911 and 1916 schemes		£22,210,000
ributions		
ployers	120,475,000	
ployed	107,934,000	
cheque	81,158,000	
		£309,567,000
llaneous		646,000
iency (Approximate)		23,771,000
		£356,194,000

Payments

fits to insured contributors	£317,908,000
nses of administration	30,833,000
st on loans	3,005,000
nds of contributions	2,880,000
llaneous	1,568,000
	£356,194,000

e figures show—if the evidence were required—the need as existed since 1920 for a scheme of the kind. In order plete the picture the following table of the average num- persons registered at the Employment Exchanges as un- ed from January 1921 to December 1927 may be given

. . . .	2,130,000*	1925	1,228,000
. . . .	1,606,000	1926	1,385,000*
. . . .	1,284,000	1927	1,121,000
. . . .	1,138,000		

ute in the coal trade in both of these years.

financial position of the British scheme is that there was 1928 a debt of upwards of £20,000,000 outstanding. In- nd expenditure balance when the numbers of unemployed ts is slightly over one million. Debt repayment was making ogress until 1926 when at about the same moment the con- ns were reduced and the national coal dispute threw large s of workers in other trades on to the scheme. From over £7,000,000 the debt rose in six months to £22,000,000. e debt has been paid off and the unemployment situation far improved that the scheme is not only paying its way re is a reasonable prospect that it will continue to do so, uction of the contributions to the level suggested by Lord urgh's committee cannot be effected.

opposition as exists to a national scheme of unemploy- surance probably arises from the fear that social dangers evitably exist in such a scheme. But that fear, so far as it must have been considerably allayed by the finding of lanesburgh's committee that the cases where benefit had awn by persons who had no title to it were relatively few t that result was "due to the vigilance with which the ad- tion, while dealing fairly with the genuine claimant, gainst abuse." The committee also quoted in their report, ion to their own view, the conclusion of the secretary of rity Organisation society who said that "he began by thinking the abuses (of the scheme) serious, but on enquiry, he had been unable to find them."

Other Schemes.—At the first International Labour Conference held in accordance with the provisions of the treaty of peace it was recommended by the delegates from the nations represented at the conference: "that each member of the International Labour Organisation establish an effective system of unemployment insurance, either through a Government system or through a system of government subventions to associations whose rules provide for the payment of benefits to their unemployed members."

Compulsory schemes exist in eight States, viz., Great Britain and Northern Ireland, Russia, Italy, Austria, Queensland, Poland, Irish Free State and Germany, while voluntary systems aided by the State are in operation in nine other States, viz., Denmark, France, Norway, the Netherlands, Finland, Spain, Belgium, Czechoslovakia and Switzerland.

The scope of the several schemes naturally varies in the different countries since the need of insurance against the unemployment of classes of the population varies widely. Even where the system is compulsory it does not extend to everybody subject to the risk. On the other hand, where the system is on the voluntary basis with a government subvention it may be applied to classes or persons not covered under the compulsory systems. The upper and lower age limits for insurance also vary. Again, the conditions to be satisfied under the various national systems differ in points of detail, but there are broad lines of resemblance in most of them. For instance the unemployment against which the worker is insured is involuntary unemployment. Nor will he be paid benefits under the schemes if there is suitable employment which he can take up. In this connection it is worthy of note that in countries which have instituted compulsory systems the example of Great Britain has been followed by setting up systems of employment exchanges by means of which the existence of suitable employment may be known and jobs offered to the unemployed.

The loss of work through a trade dispute in which the worker is involved is commonly a reason for disqualification although there are various refinements on this point, *e.g.*, the duration of the disqualification may be for the period of the dispute or for any period after it has ended until the worker is again employed. Voluntarily leaving work without good cause and dismissal for misconduct are also generally grounds for refusal of benefit.

The British requirements of an initial qualifying period during which contributions shall have been paid is a usual condition as is also a waiting period, during which benefit is not payable, at the beginning of a spell of unemployment. The British system of fixed rates of benefits is not however by any means universal. Several systems provide that benefit shall bear a relation to earnings of the worker when in employment. Under the compulsory systems contributions are usually made by employers, employed and the State, although the proportion in which they share may vary. In the case of voluntary schemes administered as they generally are by the trade unions, the employers do not contribute. The payments by the workers vary according to the rules of the associations, and the State adds a proportionate contribution.

While there are still a few European countries with no national or state-aided scheme of insurance against unemployment it may be said that in Europe generally the ground is fairly well covered. In the British Dominions, however, with the exception of Queensland, very little has been done. (J. F. G. P.)

UNITED STATES

Although there has been considerable discussion of the English and European experience with public, compulsory unemployment insurance, no such provisions exist in the United States. After the great waves of general unemployment in 1914, 1920, and 1921, state insurance received serious consideration, but the prevailing sentiment against it, shared by trade unions and employers alike, prevented action. President Harding's National Unemployment Conference, held Sept. 1921, provided for an exhaustive study of the various types of unemployment insurance, but refrained from recommending State insurance. Such opinion

as there is on the subject appears to be concerned more with the devices of business regularization and stabilization than with unemployment relief.

American experiments with unemployment insurance, the bulk of which came into existence after 1920, are all of voluntary origin, are limited either to single plants or portions of an industry, and cover probably less than 150,000 persons (1929). They are schemes either initiated by employers or created by joint agreement between trade unions and employers. Systems of trade union benefits against unemployment, in which the benefit funds are raised and administered by the unions themselves, are not very extensive in the United States and have much the same features as European plans of trade union unemployment relief.

In 1929 unemployment compensation plans initiated by the employers were limited to a few plants, employing altogether probably less than 15,000 workers. The highly diverse provisions of these schemes are difficult to summarize. In general they may be divided into the plans that are designed to guarantee employment and those that are created to furnish unemployment relief. In no case, however, is the distinction clear and permanent. One plan, for example, guarantees 48 weeks of employment a year to those of its employees who have been employed by the company a specified period of time. The length of service criterion appears to be generally in use.

Unemployment funds arising out of joint agreement between employers and trade unions covered in early 1929 about 80,000 workers, limited wholly to the needle trades. The first of these was established May 1921 in the cloak and suit industry of Cleveland by agreement between the International Ladies' Garment Workers and the employers and affected some 3,000 members of the union. By the terms of this arrangement, the employers guaranteed their employees a specified number of weeks of employment in a year. They at the same time established unemployment funds to be used in compensating workers for part of the difference between the period actually worked and the period guaranteed. This plan was clearly designed to encourage the regularization of employment and to a very slight degree has had this effect.

In 1924 the same union demanded of the cloak and suit manufacturers in New York City the adoption of a similar plan of employment guarantee and unemployment insurance. This demand was not granted, but an agreement was made for the creation of an unemployment fund of 3% of the weekly payroll of the industry, with contributions of 2% from the employers and of 1% from the members of the union. Under this unemployment insurance agreement benefits were paid at the rate of $10 a week for a maximum period of 12 weeks in a year. Because of internal dissension in the union the operations of this fund were suspended in 1927.

The Cloth, Hat and Cap Makers' Union, beginning in 1923, established unemployment funds throughout the industry with contributions of 3% of the weekly payroll by the employer and no contribution from the members of the union. The rate of benefits, in this arrangement, is $13 a week for men and $9 a week for women, for a maximum period of 7 weeks in a year. Local funds in the lace industry, made up of equal contributions from employers and employees, cover only 300 workers.

The most extensive system of unemployment insurance of this type is that now in operation in the men's clothing industry in Chicago, New York and Rochester. The plan was first introduced in Chicago in May 1923, by agreement between the clothing manufacturers and the Amalgamated Clothing Workers of America. Each employer was required to contribute 1½% of his weekly payroll and each of the 25,000 members 1½% of their weekly earnings, thus creating an unemployment fund of 3% of the weekly payroll. Benefits were paid at the rate of 40% of the full-time weekly earnings of each worker for a maximum period of five weeks in the year; later this rate was reduced to 30%. In May 1928 the employers' contribution was raised to 3%, the total therefore being equivalent to 4½% of the payroll, and the maximum period of benefit to 7½ weeks. Eligibility to benefit depends on membership in the union for a specified period and in the computation of the period of unemployment both short-time and total lay-off are counted. By March 1929 the total contri tions to this fund had amounted to $5,200,000 and the total be fits to slightly more than $4,000,000. The cost of administe the fund has averaged 6% of its income.

In the summer of 1928 similar agreements were made betw the Amalgamated Clothing Workers of America and the clot manufacturers of New York City and Rochester. In each the fund is equivalent to 1½% of the payroll, contributed enti by the employer. The rules for the payment of benefits have yet been made. Altogether these three funds provide unemp ment insurance for 60,000 members of the union in the m clothing industry.

Attempts to introduce state unemployment insurance in Ma chusetts, New York, Wisconsin, Pennsylvania, Minnesota Connecticut, all failed of enactment. Some of these meas were modelled on the English system and provided for contr tions from employer, employee and the state. The Huber in Wisconsin, which for a time won considerable public supp adopted the principles of American workmen's compensa legislation by imposing the total cost of the insurance on employer, by providing that the employer's insurance prem should vary with his unemployment risk, and by permitting establishment of employer mutual insurance companies to form the function of insurance carriers.

UNEMPLOYMENT STATISTICS. The following cle deals merely with unemployment figures and their interpr tion, and as far as possible refrains from drawing deduct from them.

I. UNITED KINGDOM

Prior to the year 1912 almost the only statistics of unemp ment in the United Kingdom were those relating to unemploym among the members of certain trade unions paying unemploym benefits. These statistics go back over a considerable period. F 1888 onward returns were regularly obtained by the Boar Trade from a number of such trade unions, and for a numbe unions figures were computed for earlier years and carried b to 1851. The statistics for the earlier years, however, rest very slender basis. Until 1872 the total membership cov does not reach 100,000. In 1893, when the figures were regularly published in the *Labour Gazette* 23 unions, wit total membership of nearly 300,000, contributed returns. membership rose to 1,603,000 in 1920, but had fallen agai 833,000 in 1926, when the series was discontinued in view of immensely greater range and value of the statistics derived f the working of the Unemployment Insurance Acts. The an percentages of unemployed among members of these trade un from 1881 to 1926 are shown in Table I. on page 693.

The percentage of these trade union members unemploye the end of each month from 1888 to 1928 is shown in Table V page 694.

These percentages of unemployment were never regarde providing a trustworthy measure of the actual intensity of employment among workpeople generally. They cover a relati small portion of the industrial population; they wholly exc some of the industries, *e.g.*, agriculture and railway servic which unemployment is comparatively stable, and they includ undue proportion such fluctuating industries as engineering shipbuilding. On the other hand, the trade unions included of rather special character in that they are all unions pa unemployment benefit and they are mainly (though not enti composed of the more skilled classes of workers. Taken by large these factors tend to cancel out and close examinatio the figures during the years of overlap when the old trade u and the new insurance statistics were running together lead the view that by happy accident the trade union percentage flected not too badly the general rate of unemployment. Be

	833,000	12·2	18·2	5·2	8·2	4·3

ay, the trade union percentages may safely be regarded viding a valuable index to the *changes* in the state of ment from year to year and, more uncertainly, from month th. In this latter aspect they may be taken as giving a e of the seasonal swing of unemployment before the war. he war the sudden intrusion of high figures due to the nfluence of large trade disputes, particularly in the coal 7, often masks the seasonal trend and even before the s erratic element may, unless allowed for, lead to mis- conclusions. Read with that qualification, Table II., the averages of the percentages returned for each month e 20-year period 1894–1913 is informative.

Table II

ate, as will be seen, falls to a minimum in May and rises ximum in January.

nployment Insurance Statistics.—In the course of the year 1912 a new source of information concerning the amount and rate of unemployment opened out. Part II. of the National Insurance Act passed in Dec. 1911, provided for the institution of a system of compulsory unemployment insurance for workpeople employed in certain industries regarded as being more than commonly subject to unemployment, viz., building, public works, contracting, shipbuilding, engineering, construction of vehicles, ironfounding, and certain branches of saw-milling. From the working of this measure came the first instalment of a new series of unemployment statistics. The workpeople so insured numbered some 2,300,000, and from Sept. 1912 onwards, information concerning the rate and volume of total unemployment among these persons became publicly available. In July 1916 the scope of Unemployment Insurance was extended to include workpeople employed upon munitions work or in certain specified industries, and the numbers covered increased to approximately 3,700,000. By the acts of 1920 and 1921, the range of National Unemployment Insurance received its latest and greatest extension and with certain exceptions now covers all manual workers (and also non-manual workers earning at the rate of not more than £250 a year) of the age of 16 and upwards in all trades and industries except agriculture and domestic service, in 1928 about 11,784,000.

In respect of this very large sample of the total of employed persons there have been available, since 1921, unemployment statistics of great and increasing trustworthiness. Weekly throughout this period have been published the numbers of men, boys, women and girls "on the registers of employment exchanges" and monthly, in the *Ministry of Labour Gazette*, have been given the numbers of insured persons in the different industries and the numbers and percentages of such persons unemployed.

Numbers Registered at Employment Exchanges.—The weekly figures represent the numbers of persons registered at employment exchanges as seeking employment on the first day of the week. It should be understood that the figures include workpeople suspended or temporarily "stood-off" and persons working short time, provided they were unemployed and registered on the dates to which the returns relate. The figures also include some persons who were in employment or otherwise occupied but had registered with a view to obtaining other work, but the number of these is not material except perhaps in the case of juveniles. Table VII. on p. 695 gives the Great Britain figures for dates from Jan. 1921 to December 1928.

The figures of persons registered for employment given in table VII. are not limited to persons insured against unemployment. They include unemployed domestic servants, agricultural workers and juveniles under 16 years of age in so far as these were registered for employment. The size of "field" from which they are drawn cannot be estimated, and consequently percentages of unemployment cannot be computed from them except for special and limited purposes.

For trustworthy percentages one must turn to the unemployment insurance statistics published each month in the *Ministry of Labour Gazette*.

Insured Workpeople Unemployed.—Every person insured under the Unemployment Insurance Acts is given an unemployment book, and the number of persons insured is estimated annually when old books are exchanged for new books in the summer of each year. When an insured person comes out of work and makes a claim to unemployment benefit the unemployment book must be "lodged" at an employment exchange. It is therefore possible to obtain from a count of the lodged books a record of unemployment among insured persons; and by relating this to the total of insured persons the percentage of unemployed among insured workpeople can be calculated. Table III. on p. 694 gives the percentages for Great Britain for dates near the end of each month from Jan. 1921 to December 1928.

It should be understood that the figures of "books lodged" are not confined to persons in receipt of unemployment benefit. Over and above these, they include all persons, whether recipients of or claimants to benefit or not, whose books are lodged and who are known to be unemployed; and in the case of persons whose books remain lodged, indicating that they are not working in

Table III

an insured industry, but whose employment condition or continued existence is not known by reason of their having ceased to maintain registration, such persons are counted as unemployed for two months after their last attendance at the exchange. Further, the statistics are not confined to persons definitely without a job. Those who were not at work on the day of the count because they were "stood off" or on short time, and whose unemployment books are lodged at exchanges, are counted in the statistics as "unemployed." It should be noted that insured persons who are disqualified for the receipt of benefit under the trade dispute disqualification are not included among the numbers unemployed unless they have registered for other work.

The official figures have from the beginning distinguished between men, boys, women and girls; and since the beginning of 1926 a distinction has also been made between persons wholly unemployed (in the sense that they are definitely without a job) and those who are temporarily stopped or suspended from the service of an employer. The figures under the heading "temporary stoppages" include those persons recorded as unemployed on date of the return who were either on short time or were otherwise stood off or suspended on the definite understanding they were to return to their former employment within a period of six weeks from the date of suspension. In cases where there was no definite prospect of return within six weeks the individuals have been included in the statistics as "wholly unemployed." Table IV. gives in summary form the British figures (excluding Northern Ireland) for males and females separately and the figures for those wholly unemployed and those temporarily suspended from employment from 1926 to and inclusive of August, 1928.

Table IV

*Affected by general Coal Mining stoppage.

mployment in Various Industries.—On every insured s unemployment book is recorded the industry in which ngaged. The analysis by industries in the *Ministry of La-Gazette* for Aug. 1928 reveals wide differences in the in- of unemployment in the various groups ranging from 30% linen industry, 28% in coal mining, and 23% in iron and t the one extreme, down to less than 3% in commerce, in y and omnibus service, and scientific instrument making, s than 5% in 13 of the 100 groups.

geographical distribution of unemployment in the United m shows wide differences in the intensity in various areas. VI. below shows these variations at July 23, 1928.

Table VI

local incidence of unemployment can be followed month nth in the local unemployment index prepared by the ry of Labour and issued as a subscription publication by ationery Office. Here can be found the numbers of in- persons, and the percentage rate of unemployment for women and juveniles for 637 towns and for country areas at Britain. The issue for Aug. 13, 1928, shows towns in elsh coal areas and in the mining counties of Durham and umberland with rates of unemployment of 70, 60 and 50%, at the other extreme are whole counties, such as Surrey, and Hertfordshire, with less than 3% of unemployment dividual towns in these counties with less than 2%. These d tabulations show the concentration of the most intense loyment in certain industries and in certain districts where ndustries are found, and the virtual absence of unemploy- ver large areas.

istical information as to the personal circumstances and ial history of unemployed persons in Great Britain has reatly extended since 1923 as a result of the adoption, in ar, of a small-sample method of investigation. The method s of examining thoroughly, by reference to documents and sonal interview, the case of every hundredth person on ims files of the employment exchanges, and preparing from terial so obtained a statistical picture of the whole body nployed persons. Reports based on these enquiries analyse ults according to sex, age, degree of employability, early g, marital state, industry, date of entering insurance, con- ns paid, benefit received, etc. The impression most rea- sonably to be drawn from them is that the unemployed are not a particular class with personal characteristics which conduce to unemployment but are hardly distinguishable from any other assortment of working people. There is a preponderance, certainly, of older people. As a man or woman gets past 45 his or her liability to unemployment grows year by year. Between the ages of 30 and 40 less than 10% of the men are unemployed, but after 45 the rate of unemployment increases steadily until as men approach 70 something like 20% are unemployed and much the same, on a lower scale, takes place with women. These older people figure largely in the class described in the reports as "verging on the unemployable." Of the whole number interviewed in the 1927 enquiry only 2% were assigned by the interviewing officers to this class, and nearly three-quarters of the 2% were people over 60, many of them suffering from some physical impairment. The reports afford little ground for supposing that either family responsibilities or war service rank prominently as influences determining who will or will not be employed. It is also made quite clear in the reports that the unemployed are not a "standing army" consisting of the same people week after week and month after month. At any given date there will be found some who have been on the fund for considerable periods, perhaps 10% will have been on benefit throughout the previous year, but these will on further investigation be found to live in one or other of those industrially afflicted areas to which reference has been made, and to have been dependent upon one or other of the depressed industries. As for the rest there is a constant movement of individuals into and out of the "unemployed" group. On any Monday, 17% of the persons registered at exchanges were not there on the previous Monday; they were new-comers who had lost, or had been stood-off from, their jobs a day or two before and were either seeking other jobs or waiting for the former ones to re-open. The analyses reveal among the whole number a continuous gradation from persons who have never visited an exchange before, who will not remain on the register more than a few days, and who may never appear again, down to those who have drawn benefit every week in the previous year and have had little regular employment for several years; but this "hard core" of the unemployment problem is found to be associated with industry and locality and not with individual incompetence, laziness or depravity. For the rest, the unemployed are demonstrated to be not a "standing army" but a melting crowd whose composition changed materially from week to week; a constantly changing body of workpeople who had lately lost one job and would presently get another.

ganized trades and surveys have been made of individual cities. On the whole, however, most of the information bearing upon unemployment is in the nature of speculation.

The data used in public discussion are for the most part the results of guesses. This was particularly evident during the conference on unemployment called in 1921 by the late President Harding, when, despite the resources available to that body, no reliable estimate of the number of unemployed people in the United States could be secured. Estimates ranged from two million to six million. During 1927 and 1928, when the problem of unemployment assumed considerable importance, estimates of the number of jobless workers, all emanating from responsible sources, ran from 1,700,000 to over seven millions. The Secretary of Labor placed the number of unemployed at 1,874,050, but careful analysis revealed that this figure was a measure not of unemployment but rather of the *shrinkage of employment* which was assumed to have taken place in American industry between the average employment for the year 1925 and that for the month of January, 1928.

Trade Union Data.—Prior to 1922 current data were available which showed the extent of unemployment among trade union members in two important industrial States, namely, New York and Massachusetts. The New York figures, publication of which was begun in 1897, were discontinued in 1916. In the following table are presented the percentages of unemployment in the trade unions of the State of New York at the end of March and September for each year from 1897 to 1914:

Idleness of Members of All Labour Organizations in New York

Year	End of March		End of September	
	Membership included in reports	Percentage unemployed	Membership included in reports	Percentage unemployed
1897	142,570	30·6	168,454	13·8
1898	179,955	21·0	171,067	13·1
1899	173,516	18·3	201,904	4·7
1900	221,717	20·0	237,166	13·3

1914	*	*	552,970	24·1

*No data.

The distribution of unemployment during the period from 1902 to 1916 as between the different industries in the State of New York is shown in the table at the bottom of this page.

Non-Governmental Statistics.—Since no official data on unemployment for the entire country is collected by any Governmental agency such estimates as have been made in the United States have emanated for the most part from private sources. The first elaborate estimate, made in 1918, placed the average number of unemployed in occupations other than agriculture between 1902–1917 at 2,500,000. The maximum estimated number of jobless workers at any one time was 6,500,000 in January, 1. During 1914 the number of unemployed in any one month is estimated never to have been below a minimum of four millions. The most acceptable figures showing the average number of persons employed in non-agricultural pursuits from 1902 to 1917 and the percentages which they bore to the total normally employed population is given below:

Year	Average number unemployed	Per cent of labor supply	Year	Average number unemployed	Per cent of labor supply
1902	2,500,000	14·1	1910	1,700,000	6·5
1903	1,900,000	9·3	1911	2,800,000	10·8
1904	2,400,000	11·5	1912	2,600,000	9·6
1905	2,000,000	9·3	1913	2,600,000	9·3
1906	1,200,000	5·5	1914	4,500,000	15·8
1907	1,400,000	6·0	1915	4,600,000	16·0
1908	3,500,000	14·8	1916	2,100,000	7·1
1909	2,100,000	8·6	1917	1,400,000	4·7

Other private estimates were given wide currency in 1928 when the problem of unemployment was in the public eye. One, made by a private labour research bureau, placed the average amount of unemployment in 1927 at approximately four millions.

Another estimate, made in 1928, attempted to measure the extent of unemployment in the country from 1910 to 1928. The figures arrived at represent the difference between the probable maximum employment and the actual employment for each year. As will be seen from the table which follows, the results are quite different from those arrived at in other estimates.

Year	Maximum number of persons employed at one time	Average number actually employed	Number unemployed
1910	38,167,000	38,167,000	*
1911	38,856,000	38,360,000	496,000
1912	39,445,000	39,445,000	*
1913	40,149,000	39,882,000	267,000
1914	40,875,000	38,848,000	2,027,000
1915	41,585,000	40,106,000	1,479,000
1916	42,318,000	42,206,000	112,000
1917	43,016,000	43,016,000	*
1918	42,989,000	42,931,000	58,000
1919	42,841,000	42,766,000	75,000
1920	42,809,000	42,809,000	*
1921	43,161,000	39,508,000	3,653,000
1922	43,189,000	40,622,000	2,567,000
1923	43,284,000	43,284,000	*
1924	43,216,000	41,826,000	1,390,000
1925	42,805,000	42,418,000	387,000
1926	42,433,000	42,433,000	*
1927	42,943,000	41,477,000	1,466,000
1928 (March)	43,445,000	40,813,000	2,632,000

*Since 1900, 1912, 1917, 1920, 1923, and 1926 had been years of g business activity they were regarded as years of full employment.

latest and most reliable statistics of unemployment were led in conjunction with a survey of economic conditions United States made in the winter of 1928–29. In this sur- ie volume of unemployment was defined as the difference en the number of persons actually employed and the num- esiring and habitually dependent upon employment. The er of persons gainfully employed in or attached to the differ- ccupational and industrial groups was estimated for each nd from these estimates were subtracted the average annual ers actually employed in each group. The difference was ed to represent the average annual unemployment. The s of this survey are presented above.

e figures presented in the above table, it should be borne in are estimates of the average minimum of unemployment for ear. The maximum figure for any given year cannot be esti- l from the data presented. It is highly probable, however, he maximum exceeded the figures given above by a consider- mount. The real significance of the preceding table lies in ct that it indicates the trend of unemployment during the l covered.

ployment Data.—Beyond the material described above are no data of reputable value presenting the volume of ployment in the United States. The Bureau of Labor Statis- f the United States Department of Labor and many of the labour departments publish monthly indexes of *employ-* but these, it should be noted, do not necessarily throw any upon the course of *un*employment. They depict the number rsons employed in industry and show which industries are ng and which are contracting. But the fact that they show, xample, that employment is contracting does not necessarily that unemployment is increasing. Nor does the fact that how employment is increasing necessarily mean that unem- ent is decreasing.

rkers are constantly leaving industry and going into busi- for themselves. Some are retiring and living on their past gs, or on the income of others. Some leave industry and go ools, colleges and universities. Theoretically, unless Ameri- mployment figures cover every branch of production and dis- ion it would be quite possible for employment in the major tries of the country to be declining, and at the same time the number of unemployed grow less. On the other hand, approximately one-third of a million immigrants entering nited States each year, with about 200,000 people coming he cities from the farms, and with anywhere from 1,500,000 00,000 young people reaching the working age each year, a narked growth in our employment may at the same time be panied by a serious increase in the number of people unem- d.

e most comprehensive employment reports are to be found e monthly survey of employment for the United States as a which is published in the *Monthly Labor Review* of the d States Bureau of Labor Statistics. These reports, based returns from 12,000 plants employing over 6,000,000 work- ith a weekly payroll of over $170,000,000, present monthly es in both employment and in payrolls for 12 groups of tries classified as follows:

I. Food and Kindred Products
II. Textiles and their Products
III. Iron and Steel and their Products
IV. Lumber and Its Products
V. Leather and its Products
VI. Paper and Printing
VII. Chemicals and Allied Products
VIII. Stone, Clay and Glass Products
IX. Metal products other than Iron and Steel
X. Tobacco products
XI. Vehicles for Land Transportation
XII. Miscellaneous industries

Res. 219 on Unemployment in the United States (1929). (I. L.)

III. OTHER COUNTRIES

The statistics of unemployment compiled and issued by the different countries exhibit the widest variety in completeness and value. The only statistics yielding trustworthy *percentages* of unemployment are those concerning workers insured against unemployment, for only in such cases is the "field" of persons registered as unemployed accurately known and proof of unemployment rigorously required. Trade unions paying unemployment benefit to their members come within this category, and for these, more or less extensive and trustworthy statistics exist for many countries. The numbers covered are, however, usually only a small proportion of the whole wage-earning population, and the data require very careful examination before the degree in which the percentages reflect unemployment among workers generally can be estimated. In no country other than the United Kingdom and Germany does there exist a national system of unemployment insurance covering the bulk of wage-earners so organized and used as to produce unemployment statistics of national range and practical trustworthiness. In some countries, notably the United States, statistics of unemployment are virtually nonexistent, but in that country, as also in Canada, effort has been directed to statistics showing variations in the numbers employed from one date to another in representative establishments in certain industries. These *employment* statistics have their own especial value, but it is not possible to deduce from them with any assurance, figures of unemployment. In many countries there are national or local employment agencies, where workers desiring employment may register and the statistics of registrations and placings by these agencies give some indication of changes in intensity of unemployment in the areas where they operate but in no case, except where, as in the United Kingdom and Germany, the administration of an unemployment insurance fund is added to their employment-finding functions, do these administrative statistics give any measure of the gross volume or rate of unemployment. For these reasons the figures quoted below cannot, in any case, be taken as measures of the gross amount of unemployment in the country in question nor as reliable indications of the rate of unemployment throughout the country as a whole; and they should consequently on no account be used to compare

either the level or the rate of unemployment as between country and country.

Canada.—The official statistics compiled by the Canadian Department of Labour relate to trade union unemployment and to the state of employment based on returns from about 6,600 firms covering about a million workers. Agriculture is included in the employment statistics. The number of persons employed is expressed as a percentage of the number on Jan. 17, 1920. The trade union statistics cover some 170,000 workers and include unions which do not pay unemployment benefit. The summary figures for the five years ended June 1928 are as follows:

Date (end of month)	Number unemployed	Percentage
1923: December	11,767	7·2
1924: March	10,051	6·7
June	9,250	5·8
September	9,156	5·9
December	18,373	11·6
1925: March	13,159	8·5
June	9,578	6·1
September	8,374	5·7
December	11,716	7·9
1926: March	11,069	7·3
June	5,965	4·1
September	4,837	3·3
December	9,349	5·9
1927: March	8,975	5·7
June	5,410	3·2
September	5,314	3·1
December	11,893	6·6
1928: January	12,082	6·8
February	12,522	7·0
March	11,965	6·5
April	9,573	5·2
May	6,657	3·7
June	5,800	3·2

Australia.—The Australian official statistics relate to unemployment among trade unionists and to the operations of the public employment exchanges in the various States. The trade union statistics cover more than 400,000 workers in the principal industries, and show for each quarter and each State the number (and percentage) of members who have been unemployed for at least three days during the course of a given week. The figures relate not only to workers unemployed on account of the state of the labour market but also those unemployed on account of sickness, accident and all other reasons with the exception of trade disputes.

The statistics for the five-year period Dec. 1923 to Dec. 1927, inclusive, together with those for the quarter ending March 1928 (the latest date available), are as follows:

Date	Number unemployed	Percentage
1923: 4th quarter	24,521	6·6
1924: 1st „	29,417	7·6
2nd „	32,708	8·3
3rd „	38,482	9·5
4th „	41,420	10·3
1925: 1st „	37,836	9·3
2nd „	36,490	10·2
3rd „	29,861	7·9
4th „	34,287	8·1
1926: 1st „	34,161	8·2
2nd „	24,920	6·7
3rd „	32,871	7·6
4th „	25,351	5·7
1927: 1st „	26,280	5·9
2nd „	29,217	6·4
3rd „	29,991	6·7
4th „	38,641	8·9
1928: 1st „	45,638	10·7

Germany.—Official unemployment statistics in Germany relate to the numbers in receipt of unemployment insurance benefit (published monthly for the whole of the Reich and for the different States); to applications for work, vacancies offered, and workpeople placed in the course of employment exchange administration; and to the records of trade unions with unemployment insurance funds. The latter statistics are compiled monthly are published in the *Reichsarbeitsblatt*. They show the num of trade union members covered, over four millions in 1928, the percentage of unemployed workers registered on the Saturday of each month. There are also published mon in the *Reichsarbeitsblatt* statistics of short-time employm among the bulk of the trade unionists reported upon. These s the percentage of short-time workers at the end of each mo distinguishing sex and industry; and the number of cases of s time, classified according to the extent of loss of work (hours, 9–16 hours, 17–24 hours, 25 hours and more lost week) and the percentage which these various groups repres of the total number of cases of short-time employment recor The summary figures for the five years ending July 1928, ar follows:

*From Oct. 13, 1923 until Oct. 1, 1927, when the Unemployme Insurance Act of July 16, 1927, came into force, the German system relieving unemployment was a compromise between relief and insuran both employers and workers were compulsorily required to contrib to the funds, but the workers were not unconditionally entitled to bene Since Oct. 1, 1927, unemployment insurance proper has been in force

France.—French official statistics cover only the numbers unemployed in receipt of State assistance, and the activities employment exchanges. The statistics of State relief cover o a limited number of workpeople, the municipal and departmen unemployment funds on which they are based having only temporary and intermittent existence. The statistics of the acti ties of the employment exchanges set up in each department a open to all workers comprise, *inter alia*, the number of appli tions and vacancies outstanding and the number of placings duri the month. Both these sets of figures are given weekly in *Bulletin du Marché du Travail*. Owing mainly to the compl mentary character of agricultural and industrial employme but also to a combination of other factors, unemployment is n usually a problem of any gravity in France; but the "li register" figures cannot be taken as more than a rough indicati of ebb and flow of employment activity. In the five years en

uly 1928 they have varied between 6,883 at the end of Dec. , and 96,591 at the end of Feb. 1927. In 1928 the number on ve register fell from 32,849 in January to 8,009 in July.

lgium.—The Belgian statistics of unemployment cover t 630,000 workers voluntarily affiliated to insurance funds and uging to the chief industries and to transport. They are based he reports of these funds, which are controlled and sub-ed by the State. There are also compiled statistics of the ities of public employment exchanges, open to workers of nds and established since the war on a national scale. These series of statistics are published monthly in *La Revue du ail.* The insurance figures which are given below, distinguish een those wholly unemployed and those intermittently un-oyed on the last working day of each month.

e (end of month)	Wholly unemployed		Partially unemployed	
	Number	Per cent	Number	Per cent

etherlands.—The Dutch official unemployment statistics r some 310,000 workpeople voluntarily affiliated to unemploy- funds in the principal industries, as well as in different ches of commerce, transport and agriculture. They show, *alia,* the number of members covered, the number and ntage of unemployed registered during the course of a (an average for four or five weeks for the month), the total ber and the number of days of employment per unemployed er during the week. These figures are also combined with obtained from a few trade unions which have no unemploy- funds but are able to give information regarding the num- f members unemployed. The percentages resulting from this ination differ very slightly from the others, as the supple- ary data cover only about 9,000 workers. In addition to these ively complete figures less detailed statistics of a provisional re are compiled.

he figures for the five months ending June 1928, given below, e to members of unemployment funds, supplemented by addi- l information from trade unions without such funds.

Date (end of month)	Number unemployed	Percentage
8: January	49,424	16·1
February	27,505	9·0
March	19,740	6·3
April	15,620	5·0
May	14,083	4·4
June	14,302	4·4

veden.—Official Swedish statistics regarding employment unemployment cover state relief, showing the number of ons engaged on State or communal relief works; the activities mployment exchanges; statistics of employment in the prin- industries based on returns from about 2,000 employers oying some 270,000 workers indicating the number of work- ngaged and the general state of activity in the undertaking; unemployment among members of trade unions. The last stics cover more than 260,000 trade union members in the ipal industries and in certain branches of commerce and port. Figures for the seven months ending July 1928 follow:

Date (end of month)	Number unemployed	Percentage
8: January	37,135	14·5
February	35,183	13·4
March	36,722	13·3
April	32,218	11·7
May	22,978	8·2
June	21,257	7·6
July	20,238	7·2

(J. H.)

UNGAVA, the northern portion of the Province of Quebec, bounded by Hudson bay on the west; Hudson strait and Ungava bay on the north; and the coast strip of Labrador belonging to Newfoundland on the east. The area is estimated at more than 300,000 sq.m. and includes much of the lower portion of Labrador, with a rim of recent marine deposits along its western coast, but the interior has the usual character of low rocky hills of Archean rocks, especially granite and gneiss, with a long band of little disturbed iron-bearing rocks, resembling the Animikie, or Upper Huronian of the Lake Superior region, near its eastern side. Along Hudson bay shore there is a strip of similar rocks, and a long row of small islands of the same age, with great sheets of trap or diabase forming the tops of the hills. Ungava, like the rest of Labrador, has risen several hundred feet since the Ice age, marine beaches being found up to 700 ft. on the Hudson bay side; and it is interesting to find seals like those of the adjoining sea-coasts in the Seal lakes 100 m. inland and 800 ft. above the present sea-level. Owing to its northerly position a large part of Ungava is treeless, and belongs to the barren grounds where caribou roam and feed on the so-called caribou moss, a greyish lichen.

UNGER, FRANZ (1800–1870), Austrian physician and botanist, was born at Amthof in Steiermark on Nov. 30, 1800. He studied medicine in Graz, Vienna and Prague. He practiced in Stockerau and Kitzhübel and in 1833 became professor of botany at the University of Graz. In 1849 he went to Vienna to occupy the chair of plant physiology. In 1866 he retired to live in the country near Graz where he died on Feb. 13, 1870. Unger made many contributions to the understanding of plant anatomy and physiology, and was also much interested in plant palaeontology. He contributed numerous articles to such scientific reviews as *Neues Jahrbuch Miner., Steiermark Nat., Ver. Mitth.,* etc. His more important published works were *Die Exantheme der Pflanzen* (1833); *Ueber den Einfluss des Waldbodens auf die Verteilung der Gewächse* (1836); *Ueber der Bau und das Wachstum des Dikotyledonenstammes* (1840); *Ueber Kristallbildungen in den Pflanzenzellen* (1840); *Anatomie und Physiologie der Pflanzen* (1855); *Synopsis plantarum fossilium* (1845); *Chloris protogaea, Beiträge zur Flora der Vorwelt* (1841–47); *Inconographia plantarum fossilium* (1852); *Sylloge plantarum fossilium* (1860); *Die Urwelt* (1851); *Versuch einer Geschichte der Pflanzenwelt* (1852); *Geologie der Europäischen Waldbäumen* (1870); *Botanische Streifzüge auf den Gebiet der Kulturgeschichte* (1857–67).

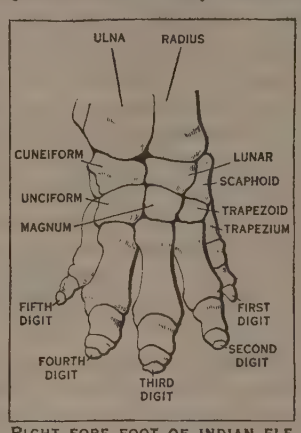
UNGER, RUDOLF (1872–), German writer and literary critic, was born in Hildburghausen in 1872. He studied in the universities of Heidelberg, Munich and Berlin, and in 1911 became professor in literature at Munich. Since 1921 he has been professor of German literature at the university of Göttingen. He is most noted for his studies in the period of Goethe. He edited *Obras de Goethe* (1910) and *Briefe von Dorothea und Friedrich Schlegel* (1913), and wrote *Philosophische Probleme in die neueren Literaturwissenschaft* (1908); *Von Nathan zu Faust* (1916), and *Weltanschauung und Dichtung* (1917); and *Zur Geschichte des Palingenesisgedankens im 18 Jahrhundert* (1924).

UNGULATA, an order or super-order of placental mammals including the hoofed herbivorous quadrupeds. Aristotle in his work on *The Parts of Animals,* in describing the extremities of the viviparous quadrupeds, says that ". . . some are bifid and have hoofs instead of nails, as the sheep, the goat, the elephant, the hippopotamus; and some have undivided feet, as the solid-hoofed animals, the horse and the ass. . . ."

After the Renaissance Wotton (1552), following Aristotle, divided the viviparous quadrupeds into the many-toed, double-hoofed and single-hoofed. In 1693 John Ray divided the viviparous quadrupeds into two grand divisions, the Ungulata, or hoofed, and the Unguiculata, or clawed, forms. The former were subdivided into: (*a*) the Monochela, or Solidipeda, with solid hoofs, including the horse, the ass and the zebra; (*b*) the Dichela, or Bisulca, with cloven hoofs; and (*c*) the Tetrachela or Quadrisulca, including the rhinoceros and hippopotamus. The Dichela were again subdivided into the Ruminantia, or ruminants, and the Non-ruminantia, or swine; the Ruminantia were finally divided into

those with permanent horns, namely the cattle, sheep and goats, and those with deciduous horns, of the deer kind. Here then was a usable and nearly correct classification of the ungulates before the beginning of the 18th century.

Subsequent discoveries have added to the Ungulata a great many extinct and some recent groups which were wholly unknown to Ray. Thus in Osborn's *Age of Mammals* (1910) the "Cohort Ungulata" includes no less than 13 "orders" of hoofed mammals. While each of these is a more or less natural group of animals related by descent from a common ancestral stock, the derivation and interrelationships of the orders themselves are still far from clear. It is well established that the typical ungulates, namely the Perissodactyla (horses, tapirs, rhinoceroses, etc.) and the Artiodactyla (ruminants, swine, etc.) were wholly distinct from each other in the Lower Eocene, some 50 to 60 million years ago. It is indeed not improbable that the ungulate, or hoofed herbivorous type, was evolved several different times from different families of placental mammals of the Cretaceous period, or in other words, that many of the resemblances between ungulate orders are examples of either parallel or convergent evolution.



RIGHT FORE FOOT OF INDIAN ELEPHANT, SHOWING PARTS

Order Condylarthra.—In the Basal Eocene formations of New Mexico and in the Lower Eocene of Wyoming have been found the fragmentary jaws and teeth, and very rarely more or less entire skeletons, of small hoofed mammals which on the whole were *structurally* intermediate between the oldest creodonts or flesh-eaters, and the true ungulates. Of these the most primitive was the genus *Mioclaenus,* known chiefly from the conical-cusped upper molars, which recall those of such primitive carnivores (creodonts) as *Tricentes* and *Claenodon.* Somewhat higher in the scale was the group of species of the genus *Hyopsodus*; these little animals were about as large as a hedgehog, the skull being of remarkably generalized type. The dental formula, (Incisors $\frac{3}{3}$ Canines $\frac{1}{1}$ Premolars $\frac{4}{4}$ Molars $\frac{3}{3}$)$\times 2 = 44$, was that of other very primitive placental mammals. The crown-patterns of the molar teeth were advancing ever further away from the primitive tritubercular type toward the more typical condylarth types presently to be described.

By far the most famous condylarth was the Lower Eocene *Phenacodus primaevus,* an animal about as large as a Newfoundland dog, which has figured in many textbooks as the "five-toed ancestor of the horse." But W. D. Matthew has advanced decisive evidence against this view. For in *Phenacodus* (*q.v.*) each quadrangular upper molar had four conical main cusps and two very small intermediate cusps or conules; whereas in the contemporary ancestors of the horse family the oblique crests of the molars were progressively developed. Even in the Lower Eocene genus *Ectocion,* which was related to *Phenacodus,* the detailed patterns of the upper and lower molars were not quite right to be structurally ancestral to the molars of the primitive horses. Another Eocene condylarth, the genus *Meniscotherium,* had more complex upper molar patterns of the type known as buno-lopho-selenodont (*i.e.,* with cones, ridges and crescents), which in some respects foreshadow the general molar types of such later ungulates as the hyracoids, the chalicotheres and the litopterns.

The foot structure of the condylarths was likewise of interest. In the five-toed hind foot the ankle bones were much like those of a contemporary creodont, with a ball-and-socket joint at the lower end, an arrangement to which the name Condylarthra refers. In the fore foot of *Phenacodus* the two rows of carpal bones were placed directly above each other, "like unstruck bricks," whereas in typical ungulates a more displaced, or alternating arrangement, was the rule. E. D. Cope supposed that *Phenacodus* was in this respect also ancestral to later ungulates but Matthew showed th in both *Phenacodus* and the later ungulates the contrasting a rangements of the carpal elements above mentioned were pro ably both derived independently from the still older interlocki creodont type.

Amblypoda (*q.v.*).—In the basal Eocene of New Mexi occur the fragmentary remains of a diversified series of sm hoofed mammals collectively known as Taligrada, or primiti Amblypoda. Some of the smaller genera were hardly bigger th insectivores and with teeth suggestive of insectivore-creodo ancestry, while the larger taligrades (*Periptychus, Pantolambd* were about the size and proportions of stocky badgers. The upp molar teeth in the smaller forms had three main cusps arrang in a triangle with the apex toward the inner side; the small int mediate cusps or conules were more or less circular; the main i ternal cusp was flanked by small cusps borne by the anteri and posterior ridges or cingula. In *Periptychus* the upper mol cusps were all subcircular and the enamel surface was pleate The brain-cast indicates a brain of extremely primitive form wi large olfactory lobes and a minimum development of the neop lium. In *Pantolambda* the upper molar crowns bore two sha outer V's and a centrally placed conical internal cusp.

In all the taligrades the feet were short, especially so in *Pant lambda.* This feature becomes greatly emphasized in the la members of the order, the coryphodons and Dinocerata. *Cor phodon* is characteristic of the Lower Eocene of Wyoming a England. It was broad-headed and almost hippopotamus-like. R lated forms have recently been found in the Eocene of Mongol *Uintatherium, Dinoceras* and their allies were characteristic of t later Eocene. Their bodies were gigantic, larger than mode rhinoceroses, with massive, post-like limbs and extremely sho stubby toes. They had sabre-like upper tusks, six or more hor like bony outgrowths on top of the skull and a brain of low typ

Notoungulata.—The condylarths and taligrades disappear from the fossil record of the northern hemisphere in early Eocen but there is some reason to believe that some of them reach South America and there gave rise to the amazingly varied seri of herbivorous mammals which are often referred to collective as notoungulates. These flourished for millions of years in Pat gonia and adjacent regions, while the perissodactyls, artiodacty and other ungulates held sway in the northern world. The notoungulates exemplified the law of adaptive radiation on grand scale. Protected by geographical barriers from the dead competition of their larger-brained northern analogues, they e ploited all the economic possibilities for ungulates available South America and gave rise to the wide diversity of forms th covered the ancient pampas. Some (the protypotheres) we small and swift-running like rabbits; others (the smaller lito terns) were like slender-limbed three-toed horses; some (*Ma rauchenia*) paralleled the llamas and camels; others closely para leled the rhinoceroses, while a few almost rivalled the elephants bulk (*Pyrotherium*).

Litopterna (*q.v.*).—Among the most primitive of the enti series of notoungulates is the genus *Didolodus,* a small forerunn of the litopterns known only from the upper cheek-teeth, whi in some ways recall those of the smaller taligrades. In the swif footed proterotheres of the Miocene of Patagonia both cheek-tee and feet suggest those of the Oligocene three-toed horses of th northern world. But in the upper molars the main inner cusp central rather than anterior in position and the posterior cros crests fail to meet the middle point of junction of the two ma outer cusps, as they do in the three-toed horses, while the fee although superficially horse-like, differ profoundly from the hors in the detailed arrangements and contacts of the tarsal element The larger litopterns (*Theosodon, Macrauchenia*), while in ge eral appearance paralleling llamas and camels, yet are more near related to the horse-like proterotheres in their deeper character

Entelonychia, or *Homalodontotheria.*—In the "*Notostylo* beds" of Lower Oligocene or Upper Eocene in Patagonia occur strange group of ungulates, varying in size from a rabbit to a rh noceros. Of these the most famous form, *Notostylops,* had a sma skull in which the upper grinding teeth have oblique and flatten

Y COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

EXTINCT MAMMALS OF TERTIARY AND QUATERNARY TIMES

. Skeleton of Lower Eocene *Phenacodus primaevus,* believed to be a five-toed ancestor of the horse

. Skeleton of Upper Oligocene *Diceratherium,* an extinct species of Rhinoceros

. Skeleton of *Neohipparion whitneyi,* a horse of the Upper Miocene plains region of North America. The outline is restored

4. Skeleton of Lower Miocene *Moropus.* It stood about six feet high at the shoulders and resembled a large horse

5. Skeleton of *Bison occidentalis,* extinct North American mammal of the Quaternary period, inhabiting Kansas and Alaska. Closest species to the existing bison

6. Pleistocene North American *Mastodon americanus,* forerunner of the elephant

walls remotely suggesting those of recent rhinoceros. The molars bore long obliquely-placed blades on the hinder part onid. The skull as a whole suggests that of the recent *Hyrax*. rtain early members in which the feet are known there are igits on the fore and hind feet, the terminal bones are cleft ne attachment of fairly large hoofs, the main ankle bone agalus) is more or less flattened. A single very small jaw, the *Arctostylops* of Matthew, found in the Lower Eocene of ning, appears to be related to these South American Ente- hia. Another apparently related type is found in the Eocene ongolia. These small jaws seem to increase the probability he South American Entelonychia, like other members of the ngulate series, had been derived from some basal Eocene or r Cretaceous forerunners of the taligrades and condylarths of orthern world. Of the later Entelonychia the best known is anta Cruzian (Lower Miocene) genus *Homalodontotherium*, er form in which all the teeth had become high-crowned and e incisors, canines, premolars and molars were pressed to- r in a continuous series without break or interval.

e *Astrapotheria*, gigantic Santa Cruzian (Lower Miocene) ; with long downwardly growing tusks, may be highly spe- ed derivatives of some early member of the Entelonychia.

xodontia (*q.v.*).—These were perhaps the most numerous in es of all the notoungulate series. The Santa Cruzian (Lower ene) *Nesodon* was about the size of a rhinoceros but with the curved and the limbs shorter. The front teeth were enlarged lattened for cropping vegetation, the upper molar teeth had nely long oblique outer walls and folded wearing surfaces. hree-toed feet, although rhinoceros-like in appearance, agreed those of the litopterns in their fundamental characters. The aean (Pleistocene) *Toxodon* was still larger, with a gigantic and a huge curved back. This was one of the famous fossil American mammals studied by C. Darwin (see *Voyage of Beagle*).

potheria.—The smaller genera of this group, named proty- res, included some that broadly resembled *Hyrax* and others were rabbit-like. They were very abundant in the Lower ene of Patagonia. The extremely high-crowned molar teeth much curved transversely, as in some rodents, and were ed for grinding tough vegetation. The later form, *Typothe-* from the Pampaean or Pleistocene of Argentina, had rodent- ncisors. It was about as large as a brown bear. This group her closely related to the toxodonts.

rotheria.—In these curious animals the molars were bilopho- that is they bore two cross-crests like those of tapirs and heres. The skull in some ways resembled those of the Pro- dea (*q.v.*) and the same is true of the tusks, but on the whole ems more likely that the pyrotheres are simply the South ican analogues of the Proboscidea.

racoidea (*q.v.*).—This characteristically African group is sented to-day by the "coneys" or dassies of southern and Africa, Abyssinia, Arabia and Syria. These furry little ani- have but slight external resemblance to ungulates but their and teeth abound in resemblances to ungulates of many s. The internal anatomy shows a curious mixture of resem- es to elephants and perissodactyls. There is no satisfactory nce, however, of the relationship of *Hyrax* to any of the s so far named. The hyracoids as a group must have been rica for many millions of years, since various forms of fossil oids have been found in the Lower Oligocene of the Fayûm ct in Egypt. In some of these very ancient hyracoids *alohyrax*) the molar teeth recall those of Eocene titanotheres *Meniscotherium* among the condylarths. In its skull *Megalo-* was more or less swine-like.

abrithopoda.—While the hyracoids played the part of the ruminants in the ancient fauna of the Fayûm, the economic of the rhinoceroses and elephants were assumed by gigantic s named *Arsinoitherium* (*q.v.*) in honour of an Egyptian n. In these very strange animals the whole fore-part of the was surmounted by an enormous pair of bony horns, which e front view rose to a great height. The folded surfaces of nolar teeth remotely recall those of the American Eocene amblypods, but the premolars rather suggest relationships with the hyracoids. The body was very massive and the skeleton shows a curious mingling of resemblances to elephants and amblypods, doubtless the results of similar adaptations to slow browsing movements and the support of the immense body weight. The existence of these highly specialized animals in Africa at such an early date as the Lower Oligocene and their apparent isolation, in spite of their adaptive resemblances to elephants and amblypods, all indicate a very long line of less and less specialized ancestors, traces of which may some day be discovered when still older fossil-bearing horizons are discovered elsewhere in Africa.

Barypoda.—Still another strange type of extinct ungulate (named *Barytherium grave* by C. W. Andrews) was discovered in the Fayûm district of Egypt along with the fossil hyracoids, arsinoitheres and ancestral elephants. The only parts of the animal found were a large lower jaw, a humerus and a radius, all of which show a curious mixture of resemblances on the one hand to the primitive proboscidean *Moeritherium* and on the other hand to *Dinoceras* of the Amblypoda. In a general way it also resembles the ancient South American *Pyrotherium*.

Proboscidea.—The evolution and structure of the elephants (*q.v.*) are considered in the article PROBOSCIDEA, and further information can be found in H. F. Osborn's *Monograph* of this group. As to the remote origin of the Proboscidea, the fact that *Arsinoitherium*, in spite of its wholly different skull and dentition, shows so many curiously detailed resemblances to the Proboscidea in its limbs and backbone, lends some support to C. W. Andrews' view that the group of "Subungulata," consisting of the Proboscidea, Hyracoidea, Embrithopoda, Amblypoda, may after all be a more or less natural assemblage of ungulates. In fact we may even advance the tentative hypothesis that some such small Lower Eocene condylarth as *Hyopsodus walcottianus* (described by Matthew and Granger), with short spreading feet, reduced canines, slightly procumbent incisors and bunodont molars, would have been an ideal starting-point for the entire subungulate series, including also the South American Pyrotheria and perhaps even the Sirenia.

Sirenia (*q.v.*).—If "common sense" and superficial appearances were trustworthy, these surprisingly whale-like mammals would still be classified with the Cetacea (*q.v.*) as they were by all early naturalists. But De Blainville as far back as 1816 classified them as "*ongulogrades anomaux pour nager*"—anomalous ungulates adapted for swimming; in his later classification he brigaded them with the Proboscidea under the term "Gravigrades." Andrews in his description of *Eosiren* (the oldest known sirenian, from the Upper Eocene of the Fayûm, Egypt) pointed out a number of significant features in which the skull of *Eosiren* resembled that of *Moeritherium*, the oldest and most primitive known proboscidean from the same formation. He also cited a number of curious anatomical details in which even the modern Sirenia agree with the elephants in spite of the enormous difference in their external appearance and mode of life. On the other hand, R. Lydekker pointed out that the unworn molar teeth of certain extinct sirenians were curiously like those of certain extinct artiodactyls (*Merycopotamus*) and that this fact suggested the derivation of the Sirenia from very early Eocene artiodactyls; but one might equally say that the molar teeth of another extinct sirenian (*Miosiren*) suggest those of the Eocene rodent *Ischyromys* and that the order Sirenia had therefore been derived from primitive rodents. Either of these views would be hard, in the present meagre state of our knowledge of the subject, to disprove; but neither has nearly as much positive evidence in its favour as the view of De Blainville and Andrews that the Sirenia are an aquatic specialization from the Proboscidean stem.

Be that as it may, however, by the time of the Lower Oligocene *Eosiren* was already definitely a sirenian in its dentition, skull and locomotor skeleton. Thereafter during the Oligocene, Miocene, Pliocene and Pleistocene epochs the changes in the skull and skeleton were comparatively slight and unimportant. The middle and late Tertiary sirenians (such as *Halitherium* and *Metaxytherium*) were for the most part considerably larger than the modern manatees and dugongs (*qq.v.*) and had a large vertically-

placed pair of upper tusks, which have been retained by the dugongs but lost by the manatees.

The Sirenia are whale-like in their torpedo-like bodies and horizontal tail flukes, in the complete absence of external hind limbs and in their flipper-like forelimbs, which however still retain external nails or vestigial hoofs. They differ markedly from typical cetaceans in their relatively small heads, truncate flattened snouts with transversely expanded upper lips covered with very large bristles. The molar teeth are two-ridged,—wholly unlike the conical teeth of toothed cetaceans. Their tusks when present are situated at the end of the muzzle and directed downward. They differ profoundly from cetaceans in their food and feeding habits, being the herbivores of the coasts and estuaries, whereas at least the typical cetaceans are essentially carnivores of the open seas. In their internal anatomy the sirenians likewise differ widely from cetaceans: the musculature of the forelimbs is less profoundly modified for aquatic life, the brain has a much less complexly convoluted surface and the digestive tract recalls that of the ruminants. The skeleton of sirenians is peculiarly massive and dense, the swollen, heavy ribs serving apparently as ballast to keep these voluminous, gas-filled bodies below the surface.

Most of the many known extinct types of sirenians conform in essentials to the dugong type, but one extinct family, the Miocene *Desmostylidae*, is widely different from the rest. In these the large upper tusks almost suggest the earliest proboscidean types but the most remarkable peculiarity is found in the molar teeth, each of which consists of a closely packed cluster of cylindrical columns of circular cross-section.

Perissodactyla.—For the origin and evolution of this order of ungulates *see* PERISSODACTYLA.

Artiodactyla.—This order is chiefly dealt with in the article ARTIODACTYLA. Here it may be noted that attempts, as by Cope and others, to brigade the artiodactyls with the perissodactyls under the terms Taxeopoda or Ungulata Vera have in the long run only served to bring out the entirely artificial nature of such an assemblage and to throw into relief the significant differences which widely separated these two orders from each other as far back as Lower Eocene times. There is indeed more to be said in favour of the view that the Artiodactyla may be an offshoot of some forerunner of the mesonychid family of the creodonts, while the Perissodactyla may be related remotely to the Cretaceous ancestors of the condylarths. Recent studies by Miss H. S. Pearson on the skull structure of the earliest artiodactyls have revealed that at a very early date the order was already subdivided into two series, one the amastoid series, in which the mastoid region of the periotic bone was completely covered by the squamosal and adjacent elements (as in the suillines and their extinct relatives) and the other, or mastoid series, in which the mastoid was well exposed on the outer side, as in the Eocene Dichobunidae and all the ruminant artiodactyls.

In conclusion, much future palaeontologic exploration, in Africa, in Mongolia and many other parts of Asia, will doubtless be necessary before many of the problems touched upon in this article can be pushed forward nearer to solution.

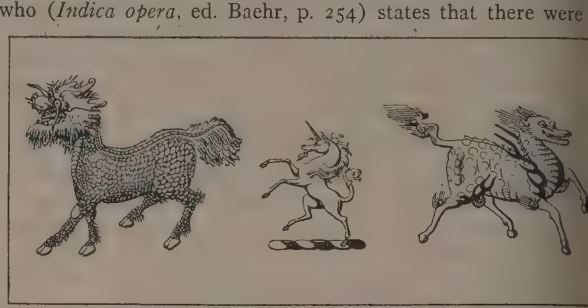
(W. K. G.)

UNICORN, a fabulous beast, usually having the head a body of a horse, the hind legs of an antelope, the tail of a li (sometimes horse's tail), sometimes the beard of a goat, and as chief feature a long, sharp, twisted horn, similar to the narwha tusk, set in the middle of its forehead (Lat. *Unicornis*, sing horned, Gr. *μονόκερως*). The earliest description is that of Ctesi who (*Indica opera*, ed. Baehr, p. 254) states that there were



FROM (LEFT AND RIGHT) GOULD, "MYTHICAL MONSTERS" (ALLEN & CO.), (CENTRAL) FAIR BAIRN, "BOOK OF CRESTS" (T. C. & E. C. JACK)

THE UNICORN OF LEGEND AND HERALDRY

The centre illustration shows the heraldic unicorn, and those on the left and right, the Chinese and Japanese varieties respectively

India white wild asses celebrated for their fleetness of foot, havi on the forehead a horn a cubit and a half in length, coloured whi red and black; from the horn were made drinking cups which we a preventive of poisoning. Aristotle mentions (*Hist. anim.*, ii. *De part. anim.*, iii. 2) two one-horned animals, the oryx, a kind antelope, and "the so-called Indian ass." In Roman times Pli (*N.H.*, viii. 30; xi. 106) mentions the oryx, the Indian ass, and Indian ox as one-horned; Aelian (*De nat. anim.*, iii. 41; iv. 52 quoting Ctesias, adds that India produces also a one-horned hors and says (xvi. 20) that the *Monoceros* was sometimes called *Ca cazonon*, possibly a form of the Arabic *Carcadān*, rhinocero

The mediaeval conception of the unicorn as possessing gre strength and fierceness is perhaps due to the fact that in certa passages of the Old Testament (*e.g.*, Num. xxiii. 22; Deut. xxx 17; Job xxxix. 9–10) the Hebrew word *R'êm*, now translated the Revised Version "wild ox," was translated in the Septuagi *μονόκερως*, in the Vulgate *unicornis* or *rhinoceros*, and in the A thorised Version "unicorn," though in Deut. xxxiii. 17 it obvious refers to a two-horned animal. Isidore xii. 2, 12 tells how the un corn has been known to worst the elephant in combat.

As a decoration on drinking-cups it symbolized the ancient b lief in the efficacy of the unicorn's horn against poison, which England remained, even in the time of Charles II., though Sir Ray Lankester (*Science from an Easy Chair*, 1910, p. 127) me tions that a cup made of rhinoceros horn was then handed over the Royal Society for experiment, with the result of entirely di proving the superstition. In the court ceremonial of France as la as 1789 instruments of "unicorn's" horn were still used for testi the royal food for poison.
